Court declared that Georgia's new death penalty law, which stipulated a separate trial and sentencing hearing for specific crimes like murder, did not per se violate the Eighth Amendment. Several justices in the majority thought that this law was "a model death penalty scheme" (Epstein and Walker 1995, 631). Although this ruling did not overturn *Furman*, it affected death penalty laws throughout the states; many legislatures simply conformed current laws to the Georgia scheme. According to Hypothesis 2, we predict little or no response after *Gregg*, just as after *Webster*. Table 3 shows how public opinion changed after this ruling.

It is clear from an initial inspection of the model that there was little shift in group attitudes toward the death

death penalty, mainly by ruling that it does not violate the Constitution (Epstein and Walker 1995, 633). This change in Court policy, just two years after *Furman*, makes *Gregg* the next highly significant death penalty case. We use *McCleskey* because of its highly controversial issue of whether African-Americans receive the death penalty more often than others. This case was highly controversial and highly publicized. Since both cases were likely to elicit major reactions by the public, they are excellent tests for our conditional response hypothesis.

penalty after *Gregg*. The only group split is between those with high education and those with lower education.¹⁵ No other postdecision independent measure indicates group cleavage. Although one might expect an exacerbation of the cleavage between Democrats and Republicans, and possibly between whites and nonwhites, none occurred.

The above finding, combined with the results of the likelihood ratio test, suggests that the Court had little effect on public opinion as a result of *Gregg*. Indeed, the chi-square for the likelihood test is nowhere near significant (refer to Table 3). We therefore conclude that the Court's decision had no significant effect on overall public attitudes, or on specific group attitudes, toward the death penalty.

In *McCleskey v. Kemp* (1987) the Court was again asked to rule on the constitutionality of Georgia's death penalty law. This time the issue focused on whether it violated the equal protection of African Americans, since statistical evidence documented that they were four times more likely to be given a death sentence in Georgia than were whites (see Epstein and Walker 1995, 634). Despite the strong evidence of a clear racial disparity in death sentences, the justices upheld the constitutionality of the Georgia law. Even though this case was highly controversial, we do not expect a pronounced public response. Table 4 explicates the results.

Compared to *Gregg*, there is even less evidence of social cleavage concerning the death penalty after *McCleskey*. There is marginal evidence that females became slightly more opposed to the death penalty in the wake of this ruling ($t = 1.81$), but no other postdecision cleavage is statistically different from zero. This indicates that the model in Table 4 comports with our conditional response hypothesis. Indeed, because the Court had already spoken about the death penalty issue, we expect little change in public attitudes despite the salience of this decision.

As a final test of Hypothesis 2, we perform the likelihood ratio test for the constrained and unconstrained models in *McCleskey* to determine whether overall public opinion moved after this ruling. The chi-square is quite small and therefore not significant (refer to Table 4). This suggests even more strongly that there was no discernible effect of this decision on public attitudes toward the death penalty.

In sum, our results indicate that the first time the Court rules on issues such as abortion and the death penalty, it affects between-group attitudes, and the overall structure of public opinion toward these issues.

¹⁵ The positive coefficient of the postdecision dummy on the education variable substantively implies that, after *Gregg*, individuals with more education supported the death penalty at a higher rate than before the decision. This may be due to the decision itself or to other macropolitical changes during the period between the surveys (such as a salient criminal trial that fostered pro-death penalty sentiments among the well educated). This statistically significant coefficient does not affect the explanatory power of the unconstrained model, however, as the likelihood ratio test between the unconstrained and constrained models does not approach statistical significance, which implies negligible change in the overall structure of public opinion toward the death penalty.

This structural response is conditioned, however, as predicted by Hypothesis 2. Indeed, our analysis of *Webster*, *Gregg*, and *McCleskey* indicates that when the Court speaks more than once, its effect is minimal in later cases. These results strongly support the predictions of the conditional response hypothesis.

CONCLUSION

The Supreme Court can and does influence public attitudes toward highly salient issues, but its effect is conditional. At times the public will react (when an issue is initially brought to the forefront of political discourse by a landmark Court decision), but at others it will not (when the Court rules on an issue again). Despite the limitations of our data (different wording for the death penalty dependent variable, and the hard-to-match questions for the abortion dependent variables), our findings are quite consistent with our theory. Indeed, they suggest that the conditional response hypothesis has much more explanatory power

than previous views of how the Supreme Court affects public opinion in the United States.

These results indicate that judicial scholars should adjust the way they approach this political phenomenon. Franklin and Kosaki (1989) demonstrate that neither the positive response hypothesis, nor simple time-series analyses are productive. We agree. But there are three avenues of research that may provide even better insight into the influence of controversial Court decisions. First, studies should focus on attitude change after the Court hands down a first landmark decision in a particular issue area (such as *US Term Limits v. Thornton*, term limits; *Romer v. Evans*, equal protection for homosexuals; and *Reno v. ACLU*, pornography on the Internet), as this is the time when the greatest effect can be expected.

Second, our results complement Hoekstra and Segal's (1996) finding that changes in public opinion are likely to occur in close proximity to case origination. They find that the Court's ruling in *Lamb's Chapel v. Center Moriches Union Free School District* (1993) probably affected attitudes in the local community, where the public had abundant information about the decision, even though the case had national implications as well. Thus, attention should be given to areas in which prior elaboration has not occurred but in which information about the Court's decision will be readily available, highly relevant, and clearly salient.

The third avenue adds to the first two. Interrupted time-series analysis may demonstrate more clearly how specific group attitudes change over time. For example, an analysis of an issue on which the Court has decided many cases—such as school prayer—may determine whether the shock from each ruling influences aggregate public attitudes toward that issue. In this way, we may be able to discern the movement of opinion and how it is changed by both landmark and subsequent decisions within the same issue area, while controlling for other macropolitical factors. This would allow a comparison of how different decisions in different issue areas elicit similar or dissimilar public responses.

At the end of the day we believe that the conditional response hypothesis should be viewed as a general explanation for how the Supreme Court affects public opinion. Indeed, it suggests that, as a credible institution, the Court can highlight issues in the public discourse (as it did with *Roe* and *Furman*), thereby changing the structure of public attitudes. Despite its high degree of legitimacy, however, the Court's ability to affect public attitudes is muted when it alters, overturns, or reiterates its initial policy choices in subsequent cases.

APPENDIX

Abortion Cases

A. Dependent Variable

The pre-*Webster* sample was asked the following question: Please tell me whether or not you think it should be possible for a pregnant woman to obtain a legal abortion if:

- there is a strong chance of serious defect in the baby. (used in Health Scale)
- the woman's own health is seriously endangered by the pregnancy. (used in Health Scale)
- she is not married and does not want to marry the man. (used in Discretionary Scale)
- the family has a very low income and cannot afford any more children. (used in Discretionary Scale)
- the pregnancy interfered with work or education. (used in Discretionary Scale)

For the Post-*Webster* sample, the abortion question was as follows: Should it be legal or should it be against the law for a pregnant woman to obtain an abortion if:

- the woman's health is seriously endangered by the pregnancy. (used in Health Scale)
- the pregnancy is the result of rape. (used in Health Scale)
- there is a chance of a serious defect in the baby. (used in Health Scale)
- she is not married and does not want to marry the father. (used in Discretionary Scale)
- the family has a very low income and cannot afford any more children. (used in Discretionary Scale)
- the pregnancy would force the woman to drop out of school or interrupt her career (combined variable). (used in Discretionary Scale)

B. Scales for dependent measures

Discretionary abortions:

- 0 = Abortion should never be legal as a discretionary measure.
- 1 = Abortion should be legal in only one instance as a discretionary measure.
- 2 = Abortion should be legal in two or more instances as a discretionary measure.

Health-related abortions:

- 0 = Abortion should never be legal even as a health measure.
- 1 = Abortion should be legal in only one instance as a health measure.
- 2 = Abortion should be legal in two or more instances as a health measure.

C. Question used to truncate sample into those who had heard and those who had not heard about the Supreme Court's decision in *Webster* (and marginal distributions)

In July, the Supreme Court decided *Webster v. Reproductive Health Services*, a major case about abortion. Do you approve or disapprove of the Supreme Court's decision in this case, or haven't you heard enough about it to have an opinion?

Respondents who either approved or disapproved: 1,251

Respondents who did not have enough information to approve or disapprove: 1,587

D. Questions used for independent variables in abortion models (both samples)

Catholic: What is your religious preference today?

Nonwhite: Are you white, black, or some other race?

Gender: Respondent's sex.

Church Attendance: Do you attend religious services every week, almost every week, once/twice a week, once a month, a few times a year, or never?

Education: What is the last grade in school you completed?

E. Distributions of independent variables for those who heard of *Webster*

Church Attendance (0 = Never; 1 = Few times a year; 2 = Once/twice a month; 3 = Almost every week; 4 = Every week): 0 = 177; 1 = 379; 2 = 200; 3 = 143; 4 = 352

Education (0 = No high school degree; 1 = High school degree; 2 = Some college; 3 = College graduate and beyond): 1 = 122; 2 = 414; 3 = 340; 4 = 375

Gender (0 = Male; 1 = female): 0 = 570; 1 = 681

Nonwhite (0 = White; 1 = Black): 0 = 1,142; 1 = 109

Catholic (0 = Other; 1 = Catholic): 0 = 940; 1 = 305

F. Distributions of independent variables for those who had not heard of *Webster*

Church Attendance (0 = Never; 1 = Few times a year; 2 = Once/twice a month; 3 = Almost every week; 4 = Every week): 0 = 192; 1 = 475; 2 = 275; 3 = 211; 4 = 434

Education (0 = No high school degree; 1 = High school degree; 2 = Some college; 3 = College graduate and beyond): 1 = 184; 2 = 630; 3 = 419; 4 = 354

Gender (0 = male; 1 = female): 0 = 692; 1 = 895

Nonwhite (0 = White; 1 = Black): 0 = 1,434; 1 = 153

Catholic (0 = Other; 1 = Catholic): 0 = 1,179; 1 = 408

3 = Independent; 4 = Independent, close to Republican; 5 = Not very strong Republican; 6 = Strong Republican):

Furman: 0 = 557; 1 = 819; 2 = 352; 3 = 302; 4 = 241; 5 = 449; 6 = 249

Gregg: 0 = 500; 1 = 803; 2 = 407; 3 = 416; 4 = 235; 5 = 440; 6 = 203

McCleskey: 0 = 658; 1 = 708; 2 = 391; 3 = 385; 4 = 288; 5 = 541; 6 = 299

Gender (0 = male 1 = female):

Furman: 0 = 1,508; 1 = 1,609

Gregg: 0 = 1,362; 1 = 1,667

McCleskey: 0 = 1,416; 1 = 1,884

Nonwhite (0 = White; 1 = Black):

Furman: 0 = 2,656; 1 = 444

Gregg: 0 = 2,700; 1 = 305

McCleskey: 0 = 2,456; 1 = 730

Jewish (0 = Other; 1 = Jewish):

Furman: 0 = 3,021; 1 = 96

Gregg: 0 = 2,867; 1 = 62

McCleskey: 0 = 3,249; 1 = 51

Capital Punishment Cases

A. Dependent variables (see footnote 12 for complete wording of questions used for this variable):

0 = Do not favor capital punishment for murderers.

1 = Favor capital punishment for murderers.

Furman: 0 = 1,151; 1 = 1,750

Gregg: 0 = 847; 1 = 2,002

McCleskey: 0 = 847; 1 = 2,211

B. Questions used for independent variables for capital punishment models

Jewish: What is your religious preference? Is it Protestant, Catholic, Jewish, some other religion, or no religion?

Nonwhite: What race do you consider yourself?

Gender: Respondent's sex.

Church Attendance: How often do you attend religious services?

Party ID: Generally speaking, do you think of yourself as a Republican, Democrat, independent, or what?

Education: Respondent's degree.

C. Distributions of independent variables for capital punishment cases

Church Attendance (0 = Never; 1 = Less than once a year; 2 = Once/twice a year; 3 = Several times a year; 4 = About once a month; 5 = 2-3 times a month; 6 = Nearly every week; 7 = Every week):

Furman: 0 = 354; 1 = 254; 2 = 372; 3 = 452; 4 = 201; 5 = 267; 6 = 214; 7 = 768; 8 = 213

Gregg: 0 = 406; 1 = 263; 2 = 407; 3 = 421; 4 = 219; 5 = 238; 6 = 117; 7 = 626; 8 = 256

McCleskey: 0 = 450; 1 = 221; 2 = 408; 3 = 466; 4 = 270; 5 = 358; 6 = 206; 7 = 650; 8 = 255

Education (0 = Less than high school; 1 = High school degree; 2 = Associate/junior college; 3 = Bachelor's degree; 4 = Graduate):

Furman: 0 = 1,187; 1 = 1,482; 2 = 37; 3 = 256; 4 = 117

Gregg: 0 = 1,064; 1 = 1,469; 2 = 58; 3 = 291; 4 = 135

McCleskey: 0 = 835; 1 = 1,719; 2 = 142; 3 = 417; 4 = 176

Party Identification (0 = Strong Democrat; 1 = Not very strong Democrat; 2 = Independent, close to Democrat;

A Political Explanation of Variations in Central Bank Independence

WILLIAM BERNHARD *University of Illinois at Urbana-Champaign*

Although central banks possess a similar function across the industrial democracies, their institutional structures—their levels of independence—differ greatly. My explanation of this variation emphasizes the informational asymmetries of monetary policymaking. Government ministers have informational advantages in the policy process, potentially creating conflicts with backbench legislators and, in a multiparty government, coalition partners. An independent central bank can help alleviate these conflicts. Politicians will choose an independent bank (1) if government ministers, party legislators, and coalition partners have different monetary policy incentives and (2) if government ministers fear that party legislators and coalition partners will withdraw their support over a policy dispute. I statistically test the argument against the cross-national variation of central bank institutions. I also use the theoretical framework to examine episodes of institutional choice and reform in Germany, Britain, and Italy.

Across the industrial democracies, central banks perform a similar function: to implement the government's monetary policy by regulating the supply of money and credit to the economy. Nevertheless, the structures of these bureaucratic institutions—their levels of independence—differ across systems. This variation presents a puzzle. On the one hand, independent central banks limit the ability of governments to manipulate monetary policy for their own short-term gain, which implies that governments would never choose an independent central bank. On the other hand, empirical research demonstrates that independent central banks are associated with superior inflation performance, which suggests that all countries would have an independent bank to improve their economies (Alesina 1989; Alesina and Summers 1993; Burdekin and Willett 1991; Grilli, Masciandaro, and Tabellini 1991; Havrilesky and Granato 1993; Neumann 1991).

Rather than focus on the economic consequences of central banks to explain the variation, I emphasize the politics surrounding the choice of these institutions. I argue that the information asymmetries of the monetary policy process can create conflicts between government ministers, their backbench legislators, and, in a multiparty government, their coalition partners. An independent central bank can help overcome these conflicts by providing information about government (i.e., cabinet) policy choices and their economic consequences. In systems in which the government's informational advantages in the policy process are likely to produce conflicts, politicians will adopt an independent central bank. If these conflicts are unlikely to occur, politicians will choose a dependent central bank to maximize the government's control over monetary policy. Differences in the relationship between legislators, parties, and government ministers across systems,

therefore, can account for the cross-national variation of central bank independence.

The first section discusses the variation of central bank independence. The second section develops the argument. The third section statistically tests how cross-national differences in legislative-government relations explain the variation of central bank institutions. The fourth section examines episodes of monetary reform in three countries to illustrate how legislative-government relations shape the choice of central bank institutions.

THE VARIATION OF CENTRAL BANK INDEPENDENCE

Political economists often rely on a variety of formal and legal indicators to measure central bank independence. These indicators usually include the appointment, term duration, and dismissal of central bank directors; government veto over the bank's policy choices; explicit policy goals for the central bank; budgetary autonomy for the central bank; performance incentives for bank directors; limitations on monetary financing of budget deficits; and control over monetary instruments. In countries with an independent central bank, the government possesses limited ex ante and ex post influence over the bank. Typically, the government appoints only a portion of an independent central bank's governing board. The government also lacks the ability to veto the bank's policy decisions or to punish central bankers through dismissal or budget cuts. In contrast, there are few restrictions on the government's authority over dependent central banks. In these systems, the government often directly controls monetary policy instruments.

Table 1 ranks central bank independence for 18 industrial democracies from 1970–90. Interestingly, independent central banks tend to be associated with federal systems, including Germany, Switzerland, and the United States (Banaian, Laney, and Willett 1983). In contrast, Britain, France, and Italy are usually classified as countries with dependent banks. During this twenty-year period, the institutional status of most central banks remained stable, despite the collapse of the Bretton Woods system of fixed exchange rates and

TABLE 1. Ranking of Central Bank Independence, 1970–90

Country	Grilli, Masciandaro, and Tabellini Total ^a	Alesina and Summers ^b	Cukierman ^c	Mean Independence ^d
Germany	0.87	1.00	0.66	0.84
Switzerland	0.80	1.00	0.68	0.83
United States	0.80	0.875	0.51	0.73
Canada	0.73	0.625	0.46	0.61
Austria	0.60	0.625	0.58	0.60
Netherlands	0.67	0.625	0.42	0.57
Denmark	0.53	0.625	0.47	0.54
Ireland	0.47	0.625	0.39	0.49
Australia	0.60	0.50	0.31	0.47
France ^e	0.47	0.50	0.28	0.42
Britain	0.40	0.50	0.31	0.42
Japan	0.40	0.625	0.16	0.40
Norway	0.44 ^f	0.50	0.14	0.40
Sweden	0.44 ^f	0.50	0.27	0.40
Belgium ^g	0.47	0.50	0.19	0.39
Italy	0.33	0.45	0.16	0.33
Spain ^h	0.33	0.375	0.21	0.31
New Zealand ⁱ	0.20	0.25	0.27	0.20

Note: All rankings are normalized from 0 (low independence) to 1 (high independence).

^aThe total Independence scale developed by Grilli, Masciandaro, and Tabellini (1991).

^bThe Alesina and Summers (1993) index was computed by averaging the Bade and Parkin (1982)/Alesina Index (1989) and their conversion of the Grilli, Masciandaro, and Tabellini scale.

^cThe index of legal independence developed by Cukierman (1992).

^dMean Independence is computed from Grilli, Masciandaro, and Tabellini (1991), Alesina and Summers (1993), and Cukierman (1992).

^eRanking prior to 1994 reform.

^fUnranked by Grilli, Masciandaro, and Tabellini (1991). The missing values were imputed by regressing their scale on the Cukierman and Alesina and Summers indexes for all countries. Using the coefficients from the equation and the values of the missing countries on the Cukierman and Alesina and Summers indexes, I computed the missing values. The correlation between that scale and the Cukierman index is $r = 0.86$. The correlation between that scale and the Alesina and Summers index is $r = 0.89$. The correlation between the Cukierman index and the Alesina and Summers index is $r = 0.85$. All three correlations are significant at the 0.001 level.

the oil shocks in the 1970s. Beginning in the late 1980s, however, politicians in a number of countries increased the independence of their central banks.

INFORMATIONAL ASYMMETRIES AND CENTRAL BANKS

The informational asymmetries of the monetary policy process shape the incentives of legislators, coalition partners, and government ministers over the choice of central bank institutions. I begin with the assumption that politicians and parties are motivated by a desire to retain office. Consequently, they have incentives to pursue policy outcomes that satisfy their constituents' preferences. But in a complex area such as monetary policy, politicians may have difficulty choosing the policy that will produce those outcomes (Krehbiel 1991). First, changes in monetary policy do not always lead to expected results. Monetary policy has indirect effects throughout the economy, often with uneven and variable lag times (Beck 1987; Friedman 1968). These outcomes are vulnerable to outside shocks and international influences. Second, changes in monetary policy may have different effects across economic sectors. Finally, the relationship between monetary policy outputs and outcomes changes over time, reflecting technological innovations in the financial and banking industry. Successful monetary policymaking, therefore,

requires that politicians invest resources to develop the expertise necessary to predict the consequences of a variety of policy proposals.

Party Legislators

Legislators face a prisoners' dilemma in the development of policy expertise (Krehbiel 1991). Information about the relationship between policy outputs and outcomes represents a collective good for legislators. It enhances the quality of legislation and ensures that policy outputs lead to outcomes that accurately reflect the desires of the enacting coalition. Each legislator, however, has high opportunity costs in the development of the expertise necessary to legislate and to oversee policy implementation effectively. Instead, legislators' time and effort are better spent campaigning or focusing on issues with specific electoral benefits. Delegating policy responsibility to government ministers helps solve this collective dilemma.

Coalition Partners

In forming a coalition government, parties make both policy compromises and policy logrolls—trading policies across issue areas. They also divide the cabinet portfolios (Laver and Schofield 1990; Laver and Shepsle 1994). Although formally constrained by the

coalition agreement, the party that controls the monetary policy dimension, the "portfolio party," has some discretion in developing new policies and in responding to situations unforeseen in the coalition agreement.

The nonportfolio party (or parties), which does not control coalition policy on the monetary dimension (although it may control other issue areas), has interests similar to those of the backbenchers in the portfolio party. Since the government's economic policy performance affects the nonportfolio party's electoral support (even if that party does not hold the monetary policy portfolios), the nonportfolio party wants policy outcomes to reflect the interests of its constituents as closely as possible. At the same time, it does not want to make costly investments in either developing policy expertise in portfolios it does not control or monitoring the portfolio party's compliance with the coalition agreement. Instead, the nonportfolio party prefers to devote resources to its own portfolios and electoral campaigns.

Government Ministers

To overcome these policy information dilemmas, backbench legislators and coalition partners delegate monetary policy authority to the government (i.e., the president, prime minister, or cabinet ministers). Government ministers acquire policy expertise, allowing them to develop legislative proposals and oversee policy implementation. By gathering information about the relationship between monetary policy outputs and macroeconomic outcomes, government ministers may help guarantee that policy outcomes reflect the desires of their party's and their coalition partner's constituents.

As an incentive for ministers to develop expertise, legislators and parties grant them institutional power over monetary policy, including agenda control and discretionary authority. First, agenda control allows a minister to limit the policy proposals considered by the cabinet and the legislature as a whole (Huber 1996; Laver and Shepsle 1994). Therefore, she may manipulate government policy by acting as a gatekeeper. Second, discretionary authority permits ministers to choose policies without explicit approval as long as those choices do not cause backbenchers or coalition partners to withdraw their support.¹ In a parliamentary system, the government needs the support of party legislators and, in multiparty systems, coalition partners to remain in office. In a presidential system, the government does not need the support of party legislators to remain in office, but it does require their support to achieve its policy goals.²

¹ Political scientists have technically described this area of agent discretion in a variety of contexts, including legislative agenda setting (Aldrich 1995) and bureaucratic policymaking (Calvert, McCubbins, and Weingast 1989; Ferejohn and Shipan 1990; Hammond and Knott 1993).

² The range of governmental discretion reflects the configuration of policy preferences among the government's legislative and coalition supporters as well as the expected policy outcome that would result from a veto of the government's policy choice. In a single-party

Although ministers must maintain the support of backbenchers and coalition partners, they may be tempted to use their expertise to manipulate monetary policy for their own electoral and policy goals—goals that may differ from those of their legislative and coalition supporters. In fact, the government has two informational advantages over backbenchers and coalition partners in monetary policy. Not only are ministers in a position to know more about the relationship between policy outputs and outcomes, but also they may conceal their actual monetary policy choices from party legislators and coalition partners. Since no single indicator captures the direction of monetary policy, the government can obfuscate its policy intentions. Indeed, the government has incentives to maintain secrecy about its plans (Cukierman 1992). Secrecy allows the government to generate politically expedient temporary booms in real economic conditions through surprise monetary expansions. Providing information to its legislative and coalition supporters about monetary policy could negate the ability of the government to manipulate short-term economic outcomes.

Asymmetric Information and Political Conflict

The delegation of policy authority to the government solves the policy information dilemma, but it creates the potential for new conflicts between legislators, coalition partners, and ministers—conflicts which could threaten the ability of each to remain in office.

First, the government's monetary policy choices influence the electoral fortunes of party legislators and coalition partners. Although macroeconomic outcomes may not be a decisive factor for an individual legislator or for a nonportfolio party, empirical evidence across systems indicates that inflation negatively affects the incumbent government's electoral fortunes (Lewis-Beck 1988; Powell and Whitten 1993). Backbenchers and coalition partners, therefore, must decide whether to trust government ministers to pursue policies that will help their electoral fortunes.

Second, information asymmetries can threaten the government's position in office. Despite the expertise of ministers, policy outputs may have unintended consequences, producing outcomes unacceptable to the government's legislative and coalition supporters. Without the necessary technical expertise and oversight capability, backbenchers and coalition partners may blame the government for inflationary outcomes beyond the government's control and withdraw their

government, the government's policy discretion depends on the distribution of policy preferences of both legislators as a whole and legislators in the governing party (Aldrich 1995; Cox and McCubbins 1993). In a multiparty government, the government's policy discretion reflects the nature of the coalition bargain and the policy distance between parties as well as the need to maintain the support of party members and the legislative floor (Austen-Smith and Banks 1990; Laver and Schofield 1990; Laver and Shepsle 1996). As the policy preferences of government supporters become more diverse, the government's policy discretion generally increases.

support, even though the government may have attempted to pursue policies in their interest.

Independent Central Banks

One way for politicians to overcome these potential conflicts is to rely on the central bank for policy information.³ Central bankers possess private information about the government's policies and their outcomes. Since the government depends on the central bank to implement its policy choices, central bank bureaucrats are informed of policy changes. As experts in the policy area, central bankers can forecast and evaluate the consequences of the government's policy.

The structure of an independent central bank lends credibility to the information it reveals about the government's monetary policy choices. First, because the government lacks ex post authority over an independent central bank, central bankers can contradict the government's policy analyses without fear of government retribution. Second, since the government appoints only a portion of an independent central bank's governing board, all the members of the board may not share the government's policy preferences. In fact, the appointment procedures of many independent central banks produce boards that reflect the major divisions over monetary policy within the society, which ensures that board members have policy preferences roughly similar to those in the legislature. In Germany, for example, differences in monetary policy preferences usually follow party lines. Until recently, each Land government appointed a representative to the Central Bank Council, which guaranteed that the political composition of the Bundesbank council echoed the balance of political representation in the country as a whole. In the United States, differences over monetary policy are primarily regional rather than partisan, pitting conservative easterners against southern and western monetary populists (Woolley 1984). Placing Reserve Bank governors elected by regional stockholders on the Federal Open Market Committee, the Federal Reserve's main decision-making body, ensures a balance of regional interests over monetary policy similar to those in Congress. These institutional features enhance the central bank's credibility with the legislature.

An independent central bank's policy information can help solve the conflicts created by the information asymmetries of the policymaking process. The government's legislative and coalition principals can learn about the consequences of the government's monetary policy from the central bank, allowing them to veto policies that may hurt their electoral fortunes. This information also can help government ministers retain their position in office. An independent bank can provide credible verification that ministers attempted

to achieve certain outcomes, even if those policy choices unintentionally produced results unacceptable to legislative and coalition supporters.

An independent central bank does entail costs, however. Limited government authority over the bank creates the possibility of bureaucratic drift. Furthermore, an independent bank may constrain the government's policy flexibility or ability to react to unforeseen circumstances. An independent bank also limits the ability of the government to manipulate monetary policy for its own short-term electoral or partisan gains—gains which may benefit some of the government's legislative supporters and coalition partners.

With a dependent central bank, the government retains ex ante and ex post authority. Since the government appoints the bank's board, central bankers are likely to share the government's policy preferences. In addition, central bankers will not criticize government policy, since ministers possess the ability to punish them. Consequently, central bankers cannot credibly signal their private information about the government's policy decisions. Backbenchers and coalition partners will view the bureaucrats' signals as no more than efforts to win the government's approval. A dependent central bank, therefore, preserves the government's informational advantages in the policy process.

Evidence from a number of countries indicates that central bankers and politicians recognize the informational role of independent central bankers in the policy process. Officials at the German central bank (the Bundesbank) and the European Commission point to the informativeness of the Bundesbank as a justification for independent central banks in democratic societies (personal interviews, spring 1993). They argue that the Bundesbank had the responsibility to comment on the direction and consequences of government economic policies. Together with private economic institutes, the Bundesbank's opinions and forecasts provide counterweights to the government's biased statements on economic policy.

Parliamentary debates in New Zealand over the 1989 Reserve Bank bill echoed this informational justification for reforming the central bank. Proponents argued that an independent central bank would make policy-making more transparent. While the government would determine the ultimate objectives of monetary policy, the central bank would report to the parliament about the economic consequences of the government's policy choices and the perseverance with which the government pursued those objectives. Consequently, the legislation would "help to eliminate . . . uncertainty by enhancing the accountability of both the Reserve Bank and politicians. It will force Ministers of Finance to be open about adopting alternative policies and their inflationary effects, and will make the Reserve Bank more independent by placing the implementation of monetary policy outside day-to-day ministerial manipulation" (*New Zealand Parliamentary Debates* 1989, 10425).

In the United States, Congress requires the Federal Reserve chairman to report semiannually on monetary policy. These appearances and the Federal Reserve's

³ Legislators and coalition partners also can gather policy information themselves (e.g., through legislative committees or deputy-level cabinet positions), monitor the government's compliance with policy rules (Keech 1995), or depend on endorsements from actors affected by the policy process (McCubbins and Schwartz 1983).

regular economic reports give legislators a better understanding of both the central bank's specific activities and the president's monetary policy choices. In addition, the chairman's appearances have become a media event, focusing public attention on the government's economic policy and providing an opportunity for legislators to declare their policy preferences (Havrilesky 1993).

Although most academic accounts of central bank independence do not emphasize this informational role in the policy process, a number of political economists recognize it. Fair (1979) argues that a central bank's independence should be measured by its ability to publicize policy disputes with the government. Havrilesky (1994) suggests that independent central banks function as a "sound money oracle," making regular anti-inflationary public pronouncements. Goodman (1992) argues that independent central banks build social and political constituencies, presumably by supplying expertise and information about monetary policy. Providing such information, therefore, is one of the most critical political functions of an independent central bank.⁴

Politicians and the Choice of Central Bank Institutions

Politicians can structure the central bank to help them overcome the conflicts created by the informational asymmetries of the policy process, but doing so entails some potential costs. Under what conditions will backbenchers, coalition partners, and the government be willing to limit the government's control over the central bank?

Backbenchers and coalition partners will prefer an independent central bank if they cannot trust the government, that is, if the government's monetary policy incentives differ from those of legislative supporters and coalition partners. In this situation, backbenchers and coalition partners recognize that the government is likely to exploit its informational advantages to pursue policies that do not reflect their interests. In contrast, if party legislators and coalition partners are confident that the government shares their monetary policy goals, then they can trust ministers to pursue policies that reflect their interests. Since they have no incentive to monitor the government's policy

choices with an independent central bank, they will support a dependent bank.

The government also has an interest in the choice of bureaucratic structure. The first priority of ministers is to maintain their positions in office. If party legislators and coalition partners can credibly threaten to punish the government for its monetary policy performance—for example, by removing it from office or thwarting its policy agenda enough to make reelection unlikely—then the government will want them to have information that demonstrates its policies were intended to have consequences beneficial to their constituents. In this situation, the government has an incentive to support an independent central bank. If the threat of punishment is not credible, however, then the government has little incentive to restrict its informational advantages with an independent central bank.

The choice of central bank structure thus reflects (1) the divergence of policy incentives between the government and its legislative and coalition supporters and (2) the credibility of backbenchers' and coalition partners' threat to punish government ministers. When the government's policy incentives differ from those of backbenchers and coalition partners and when their threat to punish the government is credible, politicians will favor an independent central bank. If one of those conditions is not present, the bank will be less independent.

THE CROSS-NATIONAL VARIATION OF CENTRAL BANK INDEPENDENCE

Since the relationship between backbenchers, coalition partners, and government ministers strongly influences the choice of central bank institutions, variations in that relationship across systems can explain cross-national differences in central bank independence. This section tests the relationship of incentive divergence, the threat of punishment, and central bank independence. The Appendix contains information about the source and construction of each variable.

Incentive Divergence

In the area of monetary policy, the distribution of constituent preferences and electoral institutions condition the degree of incentive divergence between legislators, parties, and ministers.

Constituent Preferences. The distribution of monetary policy preferences among party supporters may force candidates from the same party to make different appeals to win votes. Manipulating monetary policy can help some politicians in the party. But if constituent preferences over monetary policy are diverse, then changes in monetary policy may generate externalities among certain constituents (e.g., an interest rate increase may help creditors but hurt debtors), damaging the electoral fortunes of other candidates within the party. This problem may be particularly acute for large catch-all parties or for parties that are not based on

⁴ In contrast, most recent research argues that independent central banks insulate monetary policy from political pressures. These arguments suggest that an independent central bank enhances the credibility of policy goals because independent central bankers shield policy from competing partisan pressures (Alesina 1989), possess a different time horizon from politicians (Persson and Tabellini 1990), and place more weight on controlling inflation than the median voter in society (Rogoff 1985). These arguments imply that elected politicians must abdicate responsibility for monetary policy to unelected bureaucrats to ensure successful monetary outcomes. Empirical accounts of monetary policymaking, however, suggest that politicians can influence monetary policy, even in countries with an independent bank (Goodman 1992; Havrilesky 1993; Kennedy 1991; Kettl 1986; Lohmann 1995; Marsh 1992; Scharpf 1987; Sturm 1989; Woolley 1984).

economic appeals (Budge and Farlie 1983; Kirchheimer 1966).

To measure the heterogeneity of constituent preferences over monetary policy, I employ the *Alford Index* (Alford 1963). The Alford index subtracts the percentage of voters from nonworking classes who vote for the left party(ies) from the percentage of blue-collar workers who vote the left party(ies). High values reflect a high incidence of class voting. Low values indicate that class is a less salient predictor of vote. Since low values imply that party politicians are likely to face constituents with a variety of preferences over monetary policy, the Alford index should have a negative relationship with central bank independence.

Electoral Institutions. Electoral institutions may provide politicians from the same party with divergent monetary policy incentives. Parties that compete across electoral districts of different size are likely to have conflicts over monetary policy. Candidates in smaller districts may desire to use monetary policy to appeal to particular interests, while candidates in larger districts must balance demands from a variety of constituents (Rogowski 1987). In addition, nonconcurrent elections for the government and part of the legislature provide politicians within the governing party(ies) with different incentives regarding the sequencing of monetary policy. For instance, the government may manipulate policy in order to engineer an economic boom for its election period. The eventual increase in inflation resulting from a monetary surprise, however, may adversely affect legislative elections in the next period (Alesina and Rosenthal 1995).

Politicians are likely to compete in differently sized districts or at different times in systems with "strong" bicameral legislatures. Lijphart (1984) defines strong bicameralism as a situation in which both houses have roughly equal legislative powers and are selected according to different electoral rules. I use a dummy variable for countries with *Strong Bicameralism*: Australia, Germany, Switzerland, and the United States. Systems with strong bicameral legislatures should have more independent central banks.

The Threat of Punishment

The credibility of the threat by backbenchers and coalition partners to punish the government reflects the polarization of the political system, legislative institutions, and the existence of coalition and minority governments.

Polarization. Dissatisfied backbenchers and coalition partners must cooperate with at least part of the opposition in order to challenge government policy. Highly polarized systems present few opportunities for such cooperation, due to the large policy distance between parties (Sartori 1976). Consequently, challenge is less likely. In systems with low polarization, temporary cooperation and, hence, challenges are more likely.

Following Powell (1982), I measure *Polarization* as the average percentage of electoral support for extrem-

ist parties for 1960–90. Since high levels of polarization imply that party legislators and coalition partners will be less willing to punish the government, polarization should be negatively related to central bank independence.

Legislative Institutions. Legislative institutions influence the possibility of punishment by affecting the cost to backbenchers and coalition partners of challenging the government's policy. In systems with endogenous electoral timing, dissatisfied party legislators and coalition partners must consider the possibility that a challenge to the government's policy might precipitate early elections (Huber 1996). The possibility of losing their seats in a general election may provide them with an incentive not to challenge the government. In systems with strict party discipline, backbenchers face another disincentive, since party leaders have the institutional authority to punish legislators who fail to support the government. Finally, if the political fortunes of legislators are closely tied to their party's participation in government, they may be reluctant to risk their status by challenging government policy. In contrast, if the benefits of serving in the governing party are low—if, for example, the opposition can still influence policy—then party legislators may be more willing to veto government policy (Strom 1990a, 1990b).

To capture the influence of legislative institutions, I use a dummy variable for systems with "strong and inclusive" committee systems (Powell and Whitten 1993; Strom 1990b). Since party legislators and coalition partners are more likely to withdraw their support from the government in systems with strong and inclusive legislative committees, the *Committee Strength* variable should have a positive relationship with central bank independence.

Coalition and Minority Government. There is relatively more potential for punishment in coalition or minority governments.⁵ They are more likely to fall over a policy dispute than are single-party majority governments. I calculated the proportion of time a country was governed by a coalition or minority government from 1960 to 1990 (*Coalition/Minority Government*). In systems with a high proportion, the central bank will be more independent.

The Appendix and Table A-1 summarize the independent variables and their sources. I expect independent central banks in systems with moderate left parties (low Alford index), strong bicameralism, low polarization, strong legislative committees, and regular coalition or minority governments.

⁵ There is also higher potential for monetary policy conflicts within the governing parties. If coalition partners serve constituents with different monetary policy preferences, they will disagree about the proper policy course. Therefore, cabinet ministers must make policy choices that will alienate either their own legislative party or their coalition partner.

Sample, Dependent Variable, and Methods

The sample includes the 18 countries listed in Table 1. By examining only industrial democracies, I control for a number of factors which may influence central bank independence, including the level of economic development, position in the world economy, and domestic regime stability (e.g., Clark 1992; Cukierman 1992; Maxfield 1997). From the larger set of industrial democracies, I chose countries that were rated by at least two of the three indexes in Table 1. Data availability and reliability further limited the sample.

For the dependent variable, *Central Bank Independence*, I used all four indexes of central bank independence listed in Table 1.⁶ I report the results from only the average measure. Unless noted, results for all indexes were similar. I used ordinary least squares (OLS) regression.

RESULTS

The results of model I, reported in Table 2, are partially consistent with the incentive divergence and potential punishment hypotheses. The Alford index

has a negative and significant effect on central bank independence. Systems in which the left parties have heterogeneous class support possess more independent central banks.⁷ Systems with strong bicameral legislatures also have more independent central banks. None of the indicators associated with potential punishment is significant, although each coefficient is in the predicted direction.⁸ Polarization, committee strength, and coalition/minority government are highly correlated. Although each is not individually significant, a Wald test indicates that the three variables are jointly significant at the 0.01 level ($F(3, 12) = 5.17$). Model I also passes all diagnostic tests, indicating that the residuals are not serially correlated (Durbin-Watson),⁹ are normally distributed (skewness and kurtosis), and are homoscedastic (Cook and Weisberg 1983). In

⁷ The Alford index had a significant negative relationship with the other scales, except for the Cukierman index. There, the coefficient was in the predicted direction but failed to attain conventional levels of significance (t -statistic = -1.53, critical value for two-tailed test = -2.16).

⁸ I also ran each of these variables individually. Both committee strength and the coalition/minority government variables were significant and in the predicted direction. Polarization was in the predicted (negative) direction but did not attain conventional levels of significance (t -statistic = -1.46, critical value for two-tailed test = -2.16). The results are not reported.

⁹ This is a check for spatial correlation between errors of cases located next to one another.

⁶ I also ran the models using the index from Cukierman, Webb, and Neyapti (1992) as the dependent variable. The results were similar (results not reported). All calculations were performed using Stata 5.0.

addition, there is no evidence of omitted variable bias (RESET).¹⁰

Given the joint significance of the polarization, committee strength, and coalition/minority government variables, I created a composite indicator for the threat of punishment by adding $(1 - \text{polarization})$, committee strength, and coalition/minority government. I expect this indicator to have a positive relationship with central bank independence. The results from this equation, model II, support the argument. The punishment index is significant and in the predicted direction. The Alford index and strong bicameralism variables remain significant and in the predicted direction. Model II explains 74% of the variance in the dependent variable for this sample. The model also passes all diagnostic tests.

Alternative Hypotheses

Given the importance of central banks for economic performance, political economists have offered several explanations of the variation of central bank independence.

Tying the Hands. McCubbins, Noll, and Weingast (1989) argue that politicians structure bureaucracies to guarantee that their policy goals will not be overturned in the future. Similarly, Goodman (1991) claims that governments with a preference for low inflation and which expect a short tenure will adopt an independent central bank to limit the ability of future governments to manipulate economic policy. The "tying the hands" argument suggests that highly polarized systems or systems with highly antagonistic parties should have independent central banks. Systems with moderate, centrist parties should have dependent banks, since politicians can trust the opposition to pursue similar policies. The results from models I and II contradict this hypothesis. Broadly based moderate leftist parties (low Alford index) and low levels of polarization are associated with high levels of central bank independence.

Economic Openness. A second group argues that economic openness influences the level of central bank independence (Maxfield 1997). An open economy, dependent on international trade and foreign capital, requires an independent central bank. An independent central bank can help prevent inflation from eroding the competitive position of the economy, especially in countries with fixed exchange rates. An independent central bank also helps attract foreign capital and investment by demonstrating the host government's commitment to price stability (Maxfield 1997). To test the effect of economic openness, I included *Trade* as a proportion of GDP for 1970–89. Model III indicates

that trade has no statistically significant effect on central bank independence.¹¹

Partisanship. Some political economists argue for a link between government partisanship and central bank structure. Right parties are traditionally more concerned with controlling inflation, while left parties place more emphasis on employment and wealth redistribution (Alesina 1989; Alesina and Sachs 1988; Havrilesky 1987; Hibbs 1987). Consequently, right parties will institute an independent central bank to counter inflationary pressures in the economy, while left parties will prefer a dependent bank, which allows them to manipulate monetary policy to enhance growth and employment.¹² This argument suggests, however, that new governments would reform the bank to suit their economic policy goals, which implies more cross-temporal variation in central bank independence than is empirically observed. To test the hypothesis, I created a measure of *Partisanship* based on Cameron (1984). The measure multiplies the percentage of cabinet seats held by left parties by the percentage of a legislative majority held by left parties for each year and then averages those measures across the period. Model IV reports the results of including the partisanship measure for 1970–89. No statistically significant relationship between partisanship and central bank independence emerged.¹³

Interest Groups. A fourth set of explanations centers on interest group pressure as a determinant of bureaucratic structure (Moe 1989, 1990). Both Posen (1993, 1995) and Maxfield (1994) argue that the organization and political influence of a nation's financial sector strongly determine the central bank's structure. Posen argues that systems in which the financial sector can organize an effective opposition to inflationary policies will have independent central banks. These explanations focus solely on demanders of institutions and policies—interest groups—rather than their suppliers—politicians. Politicians, however, have their own incentives regarding policy and institutions, independent of group demands.

To test this hypothesis, I used Posen's measure of *Financial Sector Strength*, which is based on the presence of universal banking, the central bank's role in the regulation of the financial sector, federalism, and party fractionalization at the national level (model V). This

¹⁰ RESET is the regression specification error test proposed by Ramsey (1969). The test uses the predicted values of the dependent variable from the original equation, raised to the second, third, and fourth powers, as additional regressors. The significance of these additional regressors is evaluated with a standard *F* test. A significant test indicates that the model is misspecified.

¹¹ I also used a population-adjusted measure of trade openness, based on Taagepera and Hayes (1977). The variable was created by regressing the (logged) proportion of trade on the (logged) population for the sample of countries. I then subtracted the predicted proportion of trade from the actual values to form the measure. This measure also failed to attain significance.

¹² It can be argued, somewhat counterintuitively, that left parties will favor independent central banks. Left parties recognize that they have little inflation-fighting credibility with financial and capital markets, which contributes to higher risk premia and the possibility of capital flight (Garrett 1995). To demonstrate their commitment to responsible economic policies, left parties may institute an independent central bank. Right parties have more credibility with markets and, consequently, less incentive to choose an independent central bank.

¹³ I employed average measures for other periods, including 1970–79 and 1980–89. These measures were not significant.

Note: * $p < .05$

measure of financial sector strength has a positive and significant relationship with central bank independence. The model also passes all diagnostic tests. When financial sector strength was included with the variables from model II, however, the punishment index and the financial sector index failed to attain significance, since those two variables are correlated ($r = 0.67$; results not reported).¹⁴ Note, however, that the residual variance (SEE) is smaller in model II (0.0893) than in model V (0.1191), suggesting that model II provides a more efficient prediction of central bank independence (Achen 1982).

I also compared models II and V with a parameter encompassing test (Granato, Inglehart, and Leblang 1996; Granato and Suzuki 1996). The test indicates whether the substitution of one model's parameters for the other's is statistically distinguishable. I used a joint F -test to test whether model II encompasses model V (symbolically, model II ξ model V). An insignificant statistic indicates that zero order restrictions on model V have no statistical effect on a joint model, composed of indicators from both models. That is, model II ξ model V. In contrast, a significant statistic signals that model II does not encompass model V, meaning that model V contains information that model II fails to capture. I also examined whether model V encompasses model II. The results of the F -tests indicate that model II encompasses model V (Table 3). In addition, the results indicate that model V does not encompass model II. Consequently, it is possible to conclude that the variables in model II possess more predictive power than does the strength of the financial sector.

Sensitivity Analysis

Small N studies may suffer from a variety of statistical problems, including the possibility that parameter estimates are strongly affected by an individual case (Granato, Inglehart, and Leblang 1996; Jackman 1987). An observation's influence reflects both its discrepancy and leverage. Discrepancy occurs when an observation is associated with a large residual. Standardized and studentized residuals indicate which observations possess unusually large residuals. Examining the residuals of model II, Britain appears to be an

outlier, since it has a standardized residual of 2.21, outside the usual cutoff of ± 2.0 (results in Table A-2). The standardized residuals also suggest that Belgium (-1.636) and Denmark (1.651) may be outliers, although neither exceeds the cutoff point.¹⁵

Leverage refers to the potential for the model as a whole to be influenced by a few cases. Two statistics, Cook's Distance (D_i) and DFFITS, measure leverage (Belsley, Kuh, and Welsch 1980). A D_i greater than $4/n$ indicates an influential observation. According to this criterion, Britain (0.499), Australia (0.309), and Denmark (0.229) are influential. A related diagnostic, DFFITS, also points to the influence of Britain (1.69) and Denmark (1.029). Both DFFITS values are greater than the $2^*(k/n)^{1/2}$ cutoff recommended by Bollen and Jackman (1990).

Another diagnostic, DFBETA_{*i*}, measures the effect of deleting one observation on each parameter estimate. An absolute value of DFBETA_{*i*} greater than one indicates that the observation shifts the coefficient at least one standard error (Bollen and Jackman 1990).¹⁶ According to this criterion, Britain exerts undue influence on the parameter estimate for the Alford index (Alford DFBETA_{Britain} = 1.19). None of the DFBETA for the other independent variables exceeds the cutoff, although the punishment index DFBETA for Britain is extremely close (-0.99). The direction of the DFBETA, however, indicates that Britain actually dampens the size of the coefficient for both the Alford index and the punishment index (i.e., pulls them both toward zero). The fact that both these variables are significant even when Britain is in the sample lends credence to the results.

Overall, the diagnostics suggest that Britain and, possibly, Denmark are problematic cases. Do these outliers invalidate the parameter estimates of model II? Following Granato, Inglehart, and Leblang (1996), I handle these cases in a variety of ways. Table 4 compares the OLS results from model II in Table 2 with a variety of estimation strategies. First, I included a dummy variable for the influential cases (Britain and Denmark) in model 4a.¹⁷ Second, I deleted these cases

¹⁴ Posen's data set did not include Norway and Sweden. Following Posen (1995), I constructed measures for those two countries using a variety of sources. In addition, Posen's measure of financial sector strength can be broken into two dimensions: The financial sector dimension is composed of the presence of universal banking and the regulatory role of the central bank. The political dimension is composed of federalism and party system fractionalization. The financial dimension is highly correlated with the punishment index ($r = 0.85$). The political dimension is correlated with the presence of strong bicameralism ($r = 0.83$). Both correlations are significant at the 0.001 level.

¹⁵ I performed similar analyses for models with other measures of central bank independence as the dependent variable. The other models did exhibit some evidence of influential outliers, although Britain was the only outlier common to all four indexes.

¹⁶ Belsley, Kuh, and Welsch (1980) suggest observations with $|DFBETA_i| > 2/(n^{1/2})$ exert undue influence. This cutoff is stronger than the standard recommended by Bollen and Jackman. For the Alford index, observations failing to meet this standard include Canada (-0.79), Denmark (0.69), and Britain (1.19). For strong bicameralism, Australia (-0.89) exceeds the cutoff. Finally, Australia (0.63), Belgium (-0.49), and Britain (-0.99) exceed the cutoff for the punishment index.

¹⁷ I also tried individual dummy variables for Britain, Denmark, and

TABLE 4. Diagnostics on Model II

	4a Dummy Variable	4b Cases Deleted	4c Robust Regression	4d Bounded Influence	4e Bootstrapped
Constant	0.45*** (0.04)	0.45*** (0.05)	0.45*** (0.05)	0.41*** (0.05)	0.40*** (0.07)
Alford Index	-1.23*** (0.18)	-1.24*** (0.18)	-1.24*** (0.17)	-0.93*** (0.22)	-0.74** (0.20)
Strong Bicameralism	0.27*** (0.03)	0.27*** (0.03)	0.26*** (0.03)	0.27*** (0.04)	0.25*** (0.05)
Punishment Index	0.10*** (0.02)	0.11*** (0.02)	0.11*** (0.02)	0.10*** (0.02)	0.09*** (0.02)
Britain/Denmark Dummy	0.25*** (0.04)				

Note: ** $p < .01$, *** $p < .001$, two-tailed test. Standard errors are in parentheses. $N = 18$, except for model 4b ($N = 16$). 4a estimated with a dummy variable for Britain and Denmark; 4b estimated without Britain or Denmark; 4c estimated using robust regression (Western 1995); 4d estimated using Welsch's (1980) one-step bounded influence estimator; and 4e estimated using bootstrap resampling of the residuals with 1,000 replications.

from the sample (4b). In both models, the independent variables continue to be significant and in the predicted direction. As expected, the parameter estimate of the Alford index becomes even more negative, while the coefficient of the punishment index increases slightly.

I also reestimated model II using three nonparametric techniques. The first employs a variant of robust regression. Robust regression produces parameter estimates that perform well even if the data slightly violate basic OLS assumptions concerning normality (Western 1995). The method I employ begins by dropping any observation with $D_i > 1$ (no observations in the sample meet this criterion). The remaining observations are weighted according to their residuals, using Huber weights and, subsequently, biweights. Weighted least squares is then used to generate new estimates. The process is iterated until the maximum change in weights drops below 0.01. Interestingly, the robust regression places zero weight on Britain and a very small weight on the Danish case (Table A-2). Consequently, the estimate in model 4c is similar to model 4b.

As with OLS, however, robust regression is also susceptible to highly influential observations (Western 1995). To constrain the influence of such cases, I used a simple one-bounded influence estimator suggested by Welsch (1980) and employed by Granato, Inglehart, and Leblang (1996), which uses the DFFITS values from the original OLS regression to downweight observations.¹⁸ The estimates, shown in model 4d, are similar to the estimates in the original OLS regressions.

Finally, I used a bootstrap technique to determine confidence intervals around the parameter estimates for each independent variable. Bootstrapping estimates the sampling distribution of a statistic, treating

the sample as a population (Mooney 1996; Mooney and Duval 1993). I resampled with replacement the residuals of model II one thousand times. The bootstrapped standard errors are presented in column 4e. Using these, I calculated the confidence intervals with the normal approximation method. For each independent variable, the 95% confidence interval does not span zero. The bootstrap confidence intervals, therefore, support the conclusions of the original OLS estimates in model II.

Each of these techniques demonstrates that the parameter estimates obtained in model II are robust. The Alford index, strong bicameralism, and the punishment index retain their significance and remain in the predicted direction.

CENTRAL BANK CHOICE AND REFORM

The statistical results indicate that differences in the relationship between party legislators, coalition partners, and government ministers can account for cross-national variations in central bank independence. This section discusses episodes of reform in Germany, Britain, and Italy to illustrate the influence of legislative-government relations in the choice of central bank institutions. Although specific events may precipitate reform, the relationship between legislators, coalition partners, and government ministers provides the underlying conditions that shape the choice and stability of central bank institutions.

Germany

The divergence of policy incentives among German politicians and the possibility that the government will be punished over a policy dispute help ensure the commitment to an independent Bundesbank.

Backbenchers and coalition partners have monetary policy incentives that differ from those of the government, due partly to Germany's federal system. First, each party's constituents possess a range of monetary policy interests, reflecting the regionalization of the

Australia. The Britain dummy variable attained statistical significance. The Denmark dummy was not significant on its own, but it did become significant when used in a model with the Britain dummy. The dummy for Australia was not statistically significant at any point.
¹⁸ If the absolute value of DFFITS_{*i*} is less than or equal to 0.34, then the weight is equal to one. If $|DFFITS_i| > 0.34$, then the weight is $0.34/|DFFITS_i|$. Weights for the bounded regression are contained in Table A-2.

German economy. Since Land party organizations control the party list for elections to the lower house, members of parliament must balance Land interests with the demands of the government to ensure their renomination. Second, the bicameral legislature creates the potential for conflict between the government, selected in the lower house (Bundestag), and party legislators in the upper house, the Bundesrat. Bundesrat representatives are appointed by the state governments. Nonconcurrent elections for the lower house and state governments provide politicians with different incentives regarding monetary policy sequencing. Finally, the proportional representation electoral system strongly discourages the formation of single-party majority governments. Coalition partners often have constituents with different and sometimes conflicting preferences, as illustrated by the tension between the Social Democrats and the Free Democrats in the early 1980s (Goodman 1992; Scharpf 1987). An independent Bundesbank helps prevent the government from pursuing policies that will hurt party legislators and coalition partners.

An independent Bundesbank also helps the government stay in office by bolstering the credibility of its economic policies. Since monetary policy remains a high salience issue in Germany, the government's principals—backbenchers, coalition partners, and, ultimately, voters—use it to gauge the government's competence. The nature of the political system enhances the government's vulnerability on this dimension. The relative proximity of the major parties on the economic and monetary policy dimension contributes to the possibility of punishment. Although each party espouses different priorities, their economic programs reflect a German consensus about the proper balance between market and state. The coalition dynamics of the party system also increase the possibility that the government will lose office over a policy dispute. As the pivot party in the system, the small Free Democrats have participated in coalitions with both the Christian Democrats and the Social Democrats. Consequently, the Free Democrats can threaten to leave the government if their senior partner does not comply with the coalition agreement.

The Bundesbank's independence, therefore, can discourage the defection of party legislators, the Free Democrats, and voters from the governing coalition. During the 1970s, the Social Democrats relied on the policy credibility of the Bundesbank to forge a coalition with the Free Democrats, despite their differences on economic policy. Although many blame the Bundesbank for exacerbating tensions between the two parties in the early 1980s (e.g., Scharpf 1987), the Bundesbank contributed to the longevity of the coalition by helping assuage the concerns of Free Democrats about the influence of the left-wing of the Social Democrats. Social Democratic ministers, therefore, had an incentive to tolerate an independent central bank in the 1970s. In contrast, Christian Democratic governments have less incentive to support an independent central bank. Since they share similar economic priorities with the Free Democrats, it is less likely that the Free

Democrats will withdraw their support over an economic policy dispute. Consequently, Christian Democratic governments have less need to rely on an independent central bank to verify their policy performance.

Indeed, Christian Democratic governments have twice attempted to gain more authority over the Bundesbank. During the founding of the Bundesbank in the 1950s and its reorganization in the 1990s, there were attempts to increase government influence over the composition of the central bank's main decision-making body. In both instances, mistrust between the government and its party supporters in the Bundesrat helped ensure the Bundesbank's independence.

After World War II, the Allies created a decentralized central banking structure consisting of legally autonomous Land (state) central banks coordinated by the Bank deutscher Lander (BdL). Article 88 of the 1949 German Basic Law required the new government to reorganize this system, which touched off a prolonged debate about its institutional design. The appointments procedure emerged as a key issue (Goodman 1992; Lohmann 1994). One side called for a centralized system, with a governing board composed only of federal government appointees. Proposals for a more decentralized system sought to retain the BdL's federal structure and increase the influence of the Land central bank presidents, appointed by the state governments, in the policy process.

The issue divided the coalition government led by the Christian Democrats. After heated internal debate, the cabinet eventually agreed to a decentralized plan and sent it to the legislature (Lohmann 1994). The Bundesrat, composed of state representatives, easily endorsed the proposal, which had support from both Christian Democrats and the Social Democratic opposition. Frozen out of power at the national level but with significant representation in the state governments, the Social Democrats perceived a decentralized structure as the best way for them to influence monetary policy (Goodman 1992). The Free Democrats, however, who had very weak support at the state level, believed that a centralized structure would afford them the best opportunity to affect policy. Consequently, they introduced in the Bundestag a counterproposal for a centralized bank. The competing bills were referred to committee, where the legislation stalled (Lohmann 1994).

In 1955–56, the BdL's restrictive monetary policy brought it in conflict with the government. Chancellor Adenauer publicly criticized the bank, and the government called for a new centralized structure, which would integrate the bank with other policymaking institutions. The Bundestag passed the motion, but the Bundesrat rejected it and reintroduced the proposal for a decentralized structure. With a majority in the Bundesrat, the Christian Democrats might have been expected to support the centralized plan, which would increase the influence of the national party over monetary policy. They were motivated, however, both by the desire to maintain state influence over monetary policy and by the need to place an institutional check

on their own party's government, since they had different incentives regarding monetary policy.

The competing proposals went again to a Bundestag committee. This time a compromise was reached: a Central Bank Council composed of up to ten central government appointees and eleven Land central bank presidents, chosen by the respective state governments. Proponents argued that the majority status of Land central bank presidents on the council provided a vital safeguard against central government manipulation of policy. The proposal unanimously passed the Bundestag and overwhelmingly passed the Bundesrat, with support from states dominated by both the Christian Democrats and the Social Democrats (Lohmann 1994). The divergence of policy incentives between the government and party legislators in the Bundesrat, therefore, helped guarantee the Bundesbank's independence.

In the early 1990s, the Bundesbank was reorganized to incorporate the eastern Lander into the system. Again, the composition of the council surfaced as a key issue. Advocates of centralization, including the Christian Democratic-led government and central government appointees to the Bundesbank, argued that the addition of new Land central bank presidents would render decision making cumbersome and unwieldy. Opponents of centralization, including most Land central bank presidents, argued that the majority status of Land central bank presidents on the council ensured the Bundesbank's independence (Henning 1994; Kaltenthaler 1996; Lohmann 1994, 1995).¹⁹ Anticipating opposition from the Bundesrat, the government proposed a council composed of nine Land central bank presidents and eight government appointees, which would increase the relative influence of central government but preserve the majority status of the Land central bank presidents. The Bundesrat rejected that proposal by a two-thirds majority, which included some Christian Democratic states, and reiterated its preference for the "one Land, one Land central bank" principle. The government countered by promising key states that they would retain their central bank, and opposition in the Bundesrat was reduced to a simple majority. Under German law, this margin was not able to block passage of the bill in the Bundestag. Although the reform increased the relative influence of federal appointees, the potential opposition from party legis-

lators in the upper house forced compromises that preserved the independence of the Bundesbank.

Britain

Throughout the postwar period, the dependent Bank of England was firmly under government control. During the early 1990s, however, support for an independent central bank increased among legislators. The Conservative government, however, opposed the idea.²⁰ Since Britain's political institutions limit the possibility of challenge from backbenchers, the government had little incentive to support a more independent bank.

The Bank of England's dependence reflected the similarity of monetary policy incentives between party legislators and government ministers. Until the 1970s, the Conservative and Labour parties each appealed to constituents with fairly homogeneous monetary policy preferences. The Conservatives represented business and the middle class. Labour's main constituents included trade unions and the working class. The Westminster political system reinforced the ideological coherence between party legislators and the government (Lijphart 1984). The majoritarian electoral system helps ensure single-party majority governments. Since Parliament is essentially unicameral, party legislators do not face nonconcurrent elections, which means they have similar incentives regarding policy sequencing. Because the system places a premium on party unity in the legislature, backbenchers have little incentive to express divergent opinions.

During the 1970s and 1980s, economic developments changed the policy preferences of each party's traditional constituency, causing conflict within both parties over the proper course of economic policy (Hall 1986). Deep divisions between Labour radicals and moderates decimated the party's electoral fortunes in the 1980s. Changes in the Conservatives' base were manifested in conflicts between "Tory wets" and radical free-market Thatcherites.

These conflicts came to a head in debates over British participation in the European Monetary System (EMS). After bringing inflation down in the early 1980s, the Conservative government allowed it to more than double by 1990, to 9.3%. Many Tory leaders, including Chancellor of the Exchequer Nigel Lawson, advocated entry into the EMS to regain control over inflation. Prime Minister Thatcher remained opposed, arguing that participation would sacrifice Britain's policymaking autonomy. Lawson resigned over the dispute, arguing in his resignation speech not only for EMS entry but also for a more independent central bank to help control inflation.

Lawson's resignation placed the Bank of England's

¹⁹ The Bundesbank president, Karl Otto Pohl, originally proposed a council composed of seven government appointees and seven Land central bank presidents, with the council president (appointed by the central government) as a tie breaker. The Bundesbank council rejected this proposal as too centralized. Pohl next proposed reducing the number of Land central banks to eight, with no change in the number of federal appointees (up to ten). By specifying which states would maintain representation on the council, Pohl was able to buy off some Land central bank presidents and forge a winning coalition within the council. Those Land central bank presidents who voted against the proposal sent a letter of protest to Chancellor Kohl requesting that each Land retain a seat on the council. This opposition included Land central bank presidents who had been nominated by both Social Democratic and Christian Democratic state governments.

²⁰ In May 1997, the newly elected Labour government increased the independence of the Bank of England by granting it authority to set interest rates. The government retains control over appointments to the bank's leadership positions. This reform reflects, in part, the Labour Party's desire to appeal to a more moderate social coalition which includes constituents with heterogeneous economic policy preferences.

independence on the agenda.²¹ The Commons Select Committee on the Treasury held hearings on the issue. The committee's final report proposed a more independent institution, similar to the newly reformed Reserve Bank of New Zealand (*Guardian*, 17 December 1993, p. 16). The report met with immediate opposition from both the Conservative and Labour frontbenches. Prime Minister John Major declared the report a "dead" issue and blocked further consideration of the proposals.²² Only the Liberal Democrats formally endorsed the reform.

Conservative leaders had no incentive to support a more independent central bank since British legislative and electoral institutions make it highly unlikely that party legislators would withdraw their support over a policy dispute.²³ Although party legislators have the formal authority to dismiss the government, several institutional factors discourage it. First, the benefits of serving in the governing party are high. Opposition legislators have little influence over policy or distributive benefits (Strom 1990a). Second, governments typically have the authority to call for new elections, forcing rebellious legislators to risk their seat at an early election (Huber 1996). Third, party leaders control a variety of electoral and party resources that allow them to punish legislators who fail to support the government's agenda. Because of these costs, governments rarely face challenges from within their own party, regardless of the opposition's position. Consequently, the Conservative government had little incentive to support an independent central bank.

Italy

While respected within Italy as one of the country's most nonpartisan institutions, the Bank of Italy has been generally classified as a dependent central bank. Beginning in the early 1980s, however, the government has increased the independence of the central bank. The so-called divorce, enacted in 1981, ended the bank's obligation to purchase unsold government securities. Since then, the bank has received greater author-

ity over monetary instruments. These reforms reflect the changing position of the Christian Democrats, Italy's main governing party in the postwar period, during the 1970s and 1980s.

Politicians within Italy's governing coalition have always faced a variety of incentives regarding monetary policy. The noneconomic appeals and factionalization of the Christian Democratic Party attracted constituents with a variety of monetary policy interests (Tarrow 1990; Wertmann 1981). The frequency of coalition governments created another source of conflict over monetary policy. The Christian Democrats had to rely on smaller parties to remain in government, including the Socialists, who appealed explicitly to unions. Labor unrest in the late 1960s and early 1970s increased tensions over economic policy both within the Christian Democratic Party and with coalition partners (Goodman 1992). Within the party, labor militancy increased the influence of the pro-labor wing, as party leaders feared that denying union demands would increase the power of the Communists. Within the coalition, the Socialists became more outspoken in defense of union interests.

As a consequence of the potential for policy conflict within the ruling coalition, most small parties and even some Christian Democrats supported a more independent bank. In 1975, for example, the Treasury minister had to appoint a new central bank governor. The minister, a Christian Democrat, favored his deputy, who had close ties to the party. The small parties and some Christian Democrats, however, opposed the partisan appointment and forced the selection of a compromise candidate (Goodman 1992). Furthermore, most parties responded positively to the 1981 divorce, which occurred under the first non-Christian Democratic prime minister in the postwar period. Only the Socialists opposed the action.

Through the 1970s, however, the Christian Democratic leadership had little incentive to support an independent bank. The polarization of the Italian party system ensured that the Christian Democrats did not face a serious challenge to their governing position. The radical economic program of the Communist Party, the Christian Democrats' main rival, discouraged the defection of smaller parties from the ruling coalition.

The picture changed in the 1970s. First, the Communist Party moderated its economic position, espousing macroeconomic discipline, austerity plans, and limited wage gains. The moderation appeared to pay dividends. While the Communists' vote share had increased steadily throughout the postwar period, it jumped more than seven percentage points between 1972 and 1976, exceeding 34%. Consequently, the Communists could claim to be a serious alternative to the Christian Democrats. In 1976, the Christian Democrats agreed to cooperate with the Communists, offering to consult them on policy decisions in return for Communist support (more specifically, nonopposition) of a Christian Democratic minority government. This agreement gave the Communists a new legitimacy with potential coalition partners and voters. At the same

²¹ In 1993, Chancellor of the Exchequer Norman Lamont also advocated a more independent central bank in his resignation speech to the House of Commons.

²² Conservative MP Nicholas Blugden attempted to place the committee report on the legislative agenda. His arguments in favor of the bill emphasized the informational role of an independent central bank: "The whole object of these proposals is to achieve openness and to insure that when a Government says it is doing one thing, it cannot give directives to the Bank which may do something quite different. My proposal does not prevent the Government giving instructions to the Bank to let inflation rip, but merely means that, if they do that, it has to be done openly and everybody has to understand the consequences. . . . We want a bit of openness between the House and the Government" (*Guardian*, 29 January 1994, p. 34).

²³ Politicians in New Zealand, another Westminster system, reformed their central bank in 1990, but the step was taken almost simultaneously with other political reforms that rejected significant portions of the Westminster model. In Britain, both opponents and proponents of central bank reform recognized that an independent central bank would be ineffective within the Westminster system. Proponents of independence, such as the *Economist* and the Liberal Democratic Party, have also advocated political reform.

time, the Christian Democratic vote stagnated. Although the elastic and nonprogrammatic appeal of patronage helped retain support, the party was unable to attract new voters, particularly young, educated professionals and immigrants from rural and southern areas (Tarrow 1990). The economic crises of the 1970s also eroded the Christian Democrats' reputation for competent economic management.

Faced with the increased possibility of losing office, the Christian Democrats undertook reforms in several policy areas—fiscal (Della Sala 1988), industrial (Locke 1995), regional (Putnam 1993), and monetary. Italy's participation in the EMS in 1979 and the divorce of the Bank of Italy were both designed to clarify the Christian Democrat's commitment to responsible economic policy and, more important, to help ensure their continued presence in office.

The divorce did clarify the Christian Democrats' responsibility for its economic policy but not in the way the leadership had hoped. In December 1982, the bank ceased all purchases of government securities, which required the government to appeal to the parliament for an extraordinary advance to finance the budget deficit (Goodman 1992). Although the request passed easily, the central bank's refusal to act forced the government to acknowledge responsibility for the fiscal crisis. Instead of highlighting the Christian Democrats' macroeconomic discipline, the divorce focused attention on the party's continuing inability to deal with Italy's long-term economic problems, particularly the national debt, and contributed to the party's popular decline.

CONCLUSION

The information asymmetries of the monetary policy process create potential conflicts between backbench legislators, coalition partners, and government ministers. The severity of these conflicts conditions politicians' incentives regarding the choice of central bank institutions. In systems where politicians have different monetary policy incentives and where backbenchers and coalition partners can credibly threaten to withdraw their support from the government, politicians will choose an independent central bank. In systems where legislators, coalition partners, and government ministers share similar policy incentives or where the government's position in office is secure, then the bank will be dependent. Both the statistical results and case accounts of central bank reform provide support for this argument. The argument has two further implications for the variation of central bank independence.

First, the argument provides a mechanism to explain the association between federalism and independent central banks. In large federal systems, politicians are likely to face a variety of incentives over monetary policy. Constituents will possess a range of preferences, reflecting regional differences in economic activity. In addition, the political institutions of federalism—such as powerful regional offices and bicameral legislatures—compel party politicians to appeal to different sets of constituents and to run for office at different

times. Consequently, the possibility of conflict over monetary policy is high in federal systems, which gives politicians an incentive to choose an independent central bank.

Second, the argument helps explain the stability of central bank institutions in the 1970s and 1980s. Despite changes in the international monetary environment and increasing inflation in many countries, domestic political institutions remained stable and provided politicians with relatively constant incentives regarding central bank institutions. As a result, politicians did not pursue central bank reform. Yet, economic changes during this period had consequences that, by the late 1980s and early 1990s, began to alter politicians' incentives (Keohane and Milner 1996). The new cleavages that developed between export sectors and those insulated from international competition contributed to conflicts within the major governing parties over monetary policy. In addition, the relationship between monetary policy outputs and outcomes became less predictable, which decreased the ability of governments to control the macroeconomy. In some countries, the effects of economic globalization significantly altered legislative-government relations, creating the conditions for an independent central bank. In other countries, domestic political institutions insulated those relations from the consequences of globalization and limited the possibility of reform. Thus, changes in the political incentives of legislators, parties, and governments, help account for variations in the timing of recent central bank reforms.

APPENDIX

Appendix Table A-1 provides values for the independent variables. Appendix Table A-2 indicates the regression diagnostics and case weights for model II.

The Alford Index

The Alford index subtracts the percentage of voters from nonworking classes who vote for a left party(ies) from the percentage of blue-collar workers who vote for a left party(ies). To create an Alford index that covers the same period as the dependent variable, I averaged two indexes, one from the 1960s and early 1970s, the other from 1990. For the first I employed data from Powell (1982), which were collected from a variety of sources. For the second I constructed an index using the World Values Survey (1990). Respondents identified both which party they would support in a hypothetical general election and their occupation. Manual workers (skilled, semiskilled, unskilled), foremen/supervisors, and agricultural workers were coded as blue collar. All others were coded as nonworking class. Left parties included Socialist, Labor, Communist, and others. The correlation between World Values index and Powell's data is $r = .52$, significant at the 0.05 level.

Although the two sources had many countries in common, the World Values Survey did not include Australia or New Zealand. I imputed the missing values by regressing the World Values Survey index on Powell's data. Using the coefficients from the equation and the values of the missing countries on Powell's data, I computed the missing values.

TABLE A-1: Independent Variables

Country	Alford Index	Strong Bicameralism	Polarization 1960-1990	Committee Strength	Coalition/Minority Government	Punishment Index ^a
Australia	0.25	1	0.00	0	0.00	1.00
Austria	0.14	0	0.01	1	0.55	2.54
Belgium	0.20	0	0.17	1	1.00	2.83
Britain	0.33	0	0.02	0	0.02	1.00
Canada	0.01	0	0.00	0	0.32	1.32

Note: For information on variable sources and creation, see the Appendix text.

^aComputed as: $(1 - \text{Polarization}) + \text{Committee Strength} + \text{Coalition/Minority Government}$. The calculation of Austria's punishment index, for example, is: $(1 - 0.01) + 1 + 0.55 = 2.54$.

Powell does not include data for Spain, which was not a democracy until the mid-1970s. Therefore, I used only the data from the World Values Survey for the Spanish case. Finally, I ran each model using Powell's data and the index created by the World Values Survey separately (results not reported). The results for each index were in the predicted direction and were significant ($p < 0.05$), although at lower levels of confidence than the averaged Alford index.

Strong Bicameralism

Lijphart (1984) defines "strong" bicameralism as a situation in which both houses have roughly equal legislative power and are selected according to different electoral rules. I use a dummy variable for countries with strong bicameralism: Australia, Germany, Switzerland, and the United States.

^aCutoff for influential observation: $|\text{Standardized Residual}| > 2.0$ (Bollen and Jackman 1990).

^bCutoff for influential observation: $|\text{Studentized Residual}| > 2.0$ (Bollen and Jackman 1990).

^cCutoff for influential observation: $D_i > 4/n$. When $N = 18$, $D_i > 0.22$ (Granato, Inglehart, and Leblang 1996).

^dCutoff for influential observation: $\text{DFFITS}_i > 2^{1/2}(k/n)^{1/2}$. When $N = 18$, $\text{DFFITS}_i > 0.94$ (Bollen and Jackman 1990).

^eCutoff for influential observation: $|\text{DFBETA}_{AA}| > 1.0$ (Bollen and Jackman 1990).

^fRobust regression weights (Western 1995).

^gBounded-influence weights (Welsch 1980).

Polarization

Following Powell (1982), I measure polarization as the percentage of electoral support for extremist parties. According to Powell, parties exhibit one of the following characteristics: (1) a well-developed nondemocratic ideology; (2) a proposal to break up or fundamentally alter the boundaries of the nation; or (3) diffuse protest, alienation, and distrust of the existing political system. I updated Powell's measure to include the average polarization for 1960–90. I follow Powell's (1982) classifications with the following exceptions: France (include National Front) and Spain (include Communist and separatist parties).

Committee Strength

I use a dummy variable for systems with "strong and inclusive" committee systems. Following Strom (1990b), Powell and Whitten (1993) define a committee system as strong if it has two of the three following characteristics: size (more than ten committees), specialization to fit the government bureaucracy, and limitations in the number of committees held by individual legislators. Inclusive committee systems require that committee chairs be distributed proportionally among all parties, regardless of their participation in government. Examples of countries with strong and inclusive committee systems are Austria, Belgium, Denmark, Germany, the Netherlands, Norway, Sweden, and Switzerland.

Coalition and Minority Government

I calculated the proportion of time a country was governed by a coalition or minority government from 1960 to 1990 using data from Woldendrop, Keman, and Budge (1993). I counted instances of "divided government" in the United States as minority government, since the president's party lacks an overall majority in Congress.

Party Aggregation and the Number of Parties in India and the United States

PRADEEP CHHIBBER and KEN KOLLMAN *University of Michigan*

We rely on data from India and the United States to show that political and economic centralization can influence the number of national parties in single-member simple-plurality electoral systems. Historically, in both countries the number of parties in local electoral districts has been near two, but the number of national parties has fluctuated. Periods of a small number of national parties in both countries correspond to periods of centralization. We argue that, as national governments centralize power and make policies that affect local areas, candidates have greater incentives to associate with national organizations, and voters have greater incentives to abandon locally competitive but nationally noncompetitive parties.

Prominent explanations for differences in the number of political parties across countries, most notably Duverger's Law and the literature related to it, have focused on the role of electoral systems. Differences in district magnitude, electoral formulas, the number of run-offs, and presidentialism have each been hypothesized as determining the number of parties (Cox 1997; Duverger [1954] 1963; Lijphart 1994; Rae 1971; Riker 1982; Shugart and Carey 1992; Taagepera and Shugart 1989). Ethnic heterogeneity has also been associated with multiple party systems.¹ In accounting for changes in the number of national parties over time within individual countries, however, explanations based solely on electoral systems or population diversity are strained. These features rarely change much within countries, and certainly not as often as party systems undergo change in some countries, such as Italy, India, Mexico, or even, as we shall show, the United States.

We examine party system change in India and the United States. Both countries are federal (with relatively strong state governments), and both have single-member, simple-plurality electoral systems. Yet, in both countries the number of parties has varied over

time.² Although the United States is widely recognized as a two-party system and India is often categorized as a one-party dominant system, the number of parties in the United States stabilized around two only after the New Deal, and the number of parties in India has fluctuated between two and seven.³ Since neither country has undergone qualitative changes either in electoral arrangements or in ethnic heterogeneity that correspond to the changes which have taken place in the party systems, one must look elsewhere for explanations of the variation in the number of parties over time in both countries.

We rely on data from India and the United States to argue that the degree of political and economic centralization can influence the number of national parties in single-member, simple-plurality systems. Party systems are formed largely on the basis of voters' and candidates' incentives to coordinate on common party labels. These incentives are related not only to electoral laws and ethnic divisions but also to the role of the national government in local politics and local economies. In particular, the cases of India and the United States suggest that, as national governments exert more political or economic control over local areas, candidates have greater incentives to associate themselves with national organizations, and voters have greater incentives to abandon locally competitive but nationally noncompetitive parties. Under increasing centralization, there will be greater similarities in party systems across different levels of vote aggregation (local, state, national). This means that, in single-member, simple-plurality systems like India and the United States, as the national government centralizes authority, we should expect the number of parties at the national level to decline and approach the number of parties at the local level, a number that will be close to two.

In the next section we propose that national party systems are best understood as aggregations of local party systems and that this conceptualization has con-

Pradeep Chhibber is Assistant Professor of Political Science, University of Michigan, Ann Arbor, MI 48109-1045. Ken Kollman is Assistant Professor of Political Science and Research Associate, Center for Political Studies, University of Michigan, Ann Arbor, MI 48109-1248.

We thank Richard Agin and Dulcey Simpkins for their excellent research assistance. Rob Franzese and Chris Achen provided valuable advice for the quantitative analysis. Comments by Andre Blais, Jenna Bednar, Nancy Burns, Jay Dow, Mike McDonald, Jacqueline Stevens, Rein Taagepera, and Mariano Torcal on earlier drafts are greatly appreciated. Data for the U.S. elections were made available by the Inter-university Consortium for Political and Social Research, University of Michigan, which bears no responsibility for conclusions or interpretations presented. Finally, we acknowledge financial assistance from the Horace H. Rackham School of Graduate Studies and the Office of Vice President for Research, University of Michigan.

¹ Ordeshook and Shvetsova (1994) and Amorim and Cox (1997) have shown that ethnic heterogeneity correlates with multiple parties across countries, especially in proportional representation systems. Key (1949), among others, made the point that the number of parties can be related to the diversity of political interests in the population. Diversity of political interests, of course, may or may not be related to ethnic diversity.

² A standard formula from Laakso and Taagepera (1979) is used in this paper to measure the number of parties.

³ Kothari (1964) first classified India as a one-party dominant system. Lijphart's (1994) analysis of India, as well as our own here, questions that characterization.

sequences for the conclusions we draw from data on electoral institutions and party systems. We then describe how the role played by the national government influences the way local parties aggregate into national parties. Next, we provide evidence from India and the United States to support our argument. We end with a discussion of alternative theories of party aggregation.

NATIONAL AND LOCAL PARTY SYSTEMS

India and the United States have similar electoral and political institutions. Both elect a national lower house from local electoral districts; both are federal systems in which localities, states, and the national government share power⁴; and both apply single-member, simple-plurality rules in all electoral districts for legislative seats.⁵ Moreover, most electoral districts in India and many in the United States are ethnically heterogeneous, and all are large enough to require mass campaigning by candidates, thus permitting or even encouraging the development of mass party organizations within district boundaries. One major institutional difference between the two countries is that the United States has a divided executive and legislature, with the executive elected (somewhat) directly, while India vests executive power in parliamentary government.

Duverger ([1954] 1963), of course, held that single-member, simple-plurality systems lead to two parties. His argument, in short, is that voters have incentives to abandon noncompetitive parties and vote for parties that have a chance of winning a share of political power. Under single-member, simple-plurality rules, only two parties consistently have a chance to win seats in the legislature (or so the argument goes). Even with recent amendments, additions, confirmations, and alternatives to Duverger (Cox 1987, 1997; Feddersen 1992; Myerson and Weber 1993; Palfrey 1989; Riker 1982; Sartori 1986), the theoretical conclusion that single-member, simple-plurality rules leads to two-party systems is fairly robust. The expected consequences for India and the United States would seem to be clear.

Empirically, however, matters are not so simple. There are the troublesome outliers to Duverger's Law. India, for one, has always been seen as exceptional. By just about any measure, the number of parties nationally in India has not been two for most periods in recent history, which seems to contradict Duverger's Law directly (Lijphart 1994). Riker (1976, 1982), in explaining the exceptionalism of the Indian case, claims that the one-party dominant system (until the 1980s) resulted from the structure of voters' preferences. The median position occupied by the Congress Party in the national electorate led it to be the consis-

tent plurality choice (Condorcet winner) *nationally*.⁶ Other researchers have either dropped India from empirical research on Duverger's Law or have just marked it as a troublesome statistical outlier (King and Janda 1985; Lijphart 1994; Ordeshook and Shvetsova 1994; Rae 1971; Taagepera and Shugart 1993).⁷

A far deeper problem with research on electoral laws in general and on Duverger's Law in particular is a confusion over predictions at the district level and at the national level. In nearly all the empirical research on the political effects of electoral laws, the one major dependent variable of interest is the number of (viable, enduring) parties at the national level. For example, Rae (1971) and Lijphart (1994) use national vote proportions or national legislative seat proportions to construct ordinal or continuous measures of the number of parties. Lijphart, for one, then compares a country's average number of seats in a district with the number of parties in that country. Presumably, the way votes are counted and used at the level of the electoral district to allocate seats in the national legislature influences the formation, sustenance, and success of national parties. The conclusions typically drawn are that Duverger's Law works or does not work because of evidence from national party systems (see, for example, Palfrey 1989, 69).

The problem with this approach is that, as a number of researchers have pointed out (Cox 1997; Cox and Monroe 1995; Gaines 1997; Leys 1959; Sartori 1986; Wildavsky 1959), Duverger's Law and its theoretical descendants essentially deal with district-level phenomena. In a country using single-member, simple-plurality rules with m electoral districts, there could be two parties in each district, but if vote proportions are used to measure the number of parties, there could be as many as $2m$ parties at the national level. This is because each candidate at the local level could hypothetically constitute a single political party. If candidates in other districts do not adhere to the same party label, then district-level votes will not aggregate into sizable or competitive national-level vote totals. In other words, for a two-party system to emerge at the national level, candidates and voters across electoral districts must coordinate on party labels. The focus of attention for national party systems, therefore, should be on what we term *party aggregation*, or the coordination of candidates or voters across electoral districts into national political parties.⁸ The conditions that make India an outlier for national-level predictions

⁴ The nature of federalism in the two countries, especially the economic and political relationship between the national government and state and local governments, is different and has changed over time.

⁵ India had a few two-member constituencies in the 1952 and 1957 national elections.

⁶ Riker (1982) argues that, by occupying the median position, the Congress Party could maintain its dominance by preventing a majority opposition from forming. A majority of voters preferred Congress to alliances with bitter rivals. Recent research on the effective number of parties in India, most notably that of Lijphart (1994), suggests that Riker may have overstated the party's margin of dominance. Congress faced significant electoral competition even in the period of legislative dominance. Nevertheless, the fact that Congress was the party of the independence movement certainly helped it maintain its electoral predominance.

⁷ Other single-member, simple-plurality countries, such as Canada, present empirical problems for Duverger's Law as well (Gaines n.d.; Riker 1982).

⁸ Cox (1997) refers to this process as linkage.

FIGURE 1. Effective Number of Parties at the National and District Level in the United States (non-South)

may actually be perfectly consistent with Duverger if local districts approximate two-party systems and party aggregation is taken into account.

To observe the effects of party aggregation, we compared district-level data and national-level data in India and the United States. We calculated the effective number of parties in each electoral district for the lower house in each country (Lok Sabha and the House of Representatives).⁹ The measure we use is the effective number of parties, N , from Laakso and Taagepera (1979). N is a continuous measure that weights larger parties (those gaining more votes or seats) significantly more than smaller parties (see the Appendix for more discussion). It is calculated as follows. For n parties receiving votes or holding seats,

$$N = \frac{1}{\sum_{i=1}^n p_i^2}.$$

The element p_i can be the proportion of popular votes attained by party i in the election or the proportion of seats in the legislature controlled by party i . In this analysis we use the proportion of popular votes.

The average of N across electoral districts, provides a measure of the effective number of parties at the district level (D_N) for lower house elections. If there are d districts in a given year, then D_N for that year is calculated as follows:

$$D_N = \frac{\sum_{j=1}^d N_j}{d}.$$

National data can be obtained by aggregating party vote totals across all districts for lower house elections for a given year. Let v_{ij} be the vote for party i in district j in a given year, and let V be the total vote for all parties in the nation in that year. For n parties nationally,

$$V = \sum_{i=1}^n \sum_{j=1}^d v_{ij}.$$

Thus, with v_i being the total vote for party i in the given year, our national-level measure of the number of parties (N_N) is

$$N_N = \frac{1}{\sum_{i=1}^n \left(\frac{v_i}{V} \right)^2}.$$

Figures 1 and 2 show D_N and N_N for both countries over the course of their history of democratic elections.¹⁰ Several patterns are immediately apparent in

⁹ Indian electoral districts are called constituencies. We use the word *district* because most readers are familiar with the term and for consistency with the U.S. data.

¹⁰ Data sources are described in the Appendix. We use the non-South only for the United States for all calculations. Also, we do not include the 1952 elections for India because state boundaries were redrawn before the 1957 national elections and have remained mostly unchanged. There is little reason to believe that adding the 1952 elections would alter our conclusions significantly.

FIGURE 2. Effective Number of Parties at the National and District Level in India

the figures. First, D_N for the United States varies only a little around two, meaning that on average two candidates have received a vast majority of the vote in electoral districts for the House of Representatives. The D_N for India reveals that between two and three candidates receive nearly all the vote on average in the districts.¹¹ Contrary to the conclusion of many studies that report India as a one-party or even a four-party system, the basic single-member, simple-plurality hypothesis of Duverger receives some support. At a minimum, the number of parties is much lower than the number of deep cleavages in most Indian districts. This important finding seriously questions the widely held belief that the numerous Indian "ethnicities" (castes and religions) axiomatically inflate the number of parties. Put another way, and more generously to those in the Duverger tradition, since D_N hovers around 2.5, it is doubtful that ethnic heterogeneity, irrespective of electoral system effects, can account for the number of parties. Furthermore, while the Congress Party has dominated the national government, others have gained significant percentages of the district vote and can be considered competitive locally.

Second, for almost all years in both countries, D_N is less than N_N , and the difference provides a measure of party aggregation problems. We use that measure in

figures 3 and 4, which will be discussed in more detail later. The larger the difference, the more severe is the problem of party aggregation. That is, a small number of candidates receive votes in each electoral district, but the same parties do not exist in all districts, and hence more parties receive votes at the national level. A difference near zero between D_N and N_N would suggest that parties aggregate nearly perfectly. Therefore, the data depicted in figures 1 and 2 suggest that two parties tend to gather a vast majority of the district votes in both India and the United States, but in many periods the same parties are not present in all districts.

Third, the extent of party aggregation is neither constant over time for either India or the United States, nor is it the same for both countries. On the one hand, in the United States there was a marked change in the 1930s. Before that time, the number of effective parties at the national level fluctuated above two, but then it settled to a stable number near two afterward. On the other hand, India displays a different pattern. The effective number of parties nationally rose in the early 1960s, dropped in the 1970s and 1980s, and then began to rise again.

These variations provide an opportunity to examine why party aggregation is more pronounced in some periods than in others. Since the district-level data stay relatively constant, what accounts for changes in the number of national parties over time?

¹¹ Third-party candidates have received more than 20% of the vote in only 15% of the Indian constituencies since 1957. The latter number has varied, however, from 22% in 1980 to 2% in 1977.

FIGURE 4. Party Aggregation and Government Spending in India**4A. Party Aggregation and National Share of Total Government Spending****4B. Party Aggregation and National Government Spending as Proportion of GNP**

WHAT AFFECTS PARTY AGGREGATION?

National party systems reflect party aggregation across electoral districts. Party aggregation, in turn, reflects the incentives for candidates to coordinate on common party labels and for voters to support parties with broader appeal outside a single electoral district.

Candidates

Candidate coordination across districts—that is, adopting common party labels—can occur for two reasons. First, candidates can respond directly to voters' policy preferences, which may be locally or nationally oriented. In some instances, voter preferences are dominated mostly by local concerns, and those preferences are used to decide among legislative candidates. Candidates, whom we can assume to be office seekers, will take on party labels that respond to voters' policy positions on local concerns. These labels may or may not correspond to national party labels. In the United States, for example, local candidates could call themselves Republicans or Democrats, if these labels communicate to voters something about local policy positions, or they could just as well call themselves Greens and Reds, if these labels were better suited to local conditions. The key point is that party labels may very well differ in surrounding districts. In other instances, voters consider mostly national policies when deciding among legislative candidates. In situations where the national government makes most decisions, such as those on taxation, the allocation of state resources, or local school curriculum, these decisions will form the basis of voters' preferences over candidates. Voters will then develop a set of preferences over the party composition of the lower house and vote according to those preferences. Candidates facing these voters will have incentives to take on party labels that communicate national policy positions.

Second, candidates may also want to coordinate across districts to influence national policies. Clearly, if the national government makes most of the decisions on policies of concern to voters, then we can expect local candidates to affiliate with parties that can make it easier for them (upon becoming legislators) to influence those decisions. Taken farther, if part of the task of the national government is to distribute resources to different parts of the country, then local leaders will want to identify with national parties in order to gain a share of the resources. They will want to affiliate not only with the party in power but also with other parties that may have a chance of attaining power. Furthermore, they may seek to associate themselves with other candidates representing similar national policy preferences and communicate to voters their combined potential power to influence national policymaking.¹²

¹² Common party labels make it easier for public officials to cooperate across levels of government (Aldrich 1995; Eldersveld 1982) and also enable ambitious politicians to attain higher level offices (Schlesinger 1991).

Voters

Under a system with centralized authority, voters see themselves as either benefiting or losing from national policies and, as a consequence, develop preferences regarding those policies. It may even be rational for them to vote for a less preferred party if it is nationally competitive (Cox 1997, chapter 10; Leys 1959). Cox and Monroe (1995) discuss voting equilibria in which voters have preferences about the composition of the national legislature and have well-defined expectations about how parties will fare in the elections nationally. They conjecture that, in equilibrium, voters will often vote for less preferred parties. For single-member, simple-plurality systems, this means they will usually abandon nationally noncompetitive parties, even though these may be locally competitive. Furthermore, in such a system, two nationally competitive parties will tend to emerge. As Cox and Monroe (1997, 14–5) summarize their argument, “the net impact of national parliamentary considerations on local Duvergerian dynamics should be clear. . . . There are multiple dynamics that serve to (1) drive down the number of parties, and (2) reinforce the national party system at the district level. . . . These dynamics . . . are particularly strong in single-member district systems.”

Voters in India and the United States, of course, have neither purely local concerns nor purely national concerns. They vote for legislators both to represent local interests and to take part in national policymaking. In both countries, however, there have been changes in the degree of political and economic centralization.

Expectations

Party aggregation is more difficult to achieve when voter preferences are mostly locally based and candidates do not have to coordinate with politicians in other districts. Both voters and candidates are inclined to focus on local matters and local labels. In India, for example, many voters choose regional parties that are ideologically similar to parties in neighboring regions, although each maintains a distinctive label and organization.¹³ As the national government centralizes power, voters develop national policy preferences, and candidates associate themselves with certain national policy positions. As a result, local party systems and national party systems begin to resemble each other.

To summarize, for single-member, simple-plurality systems, the electoral system has its most direct effect on the district level. Voters tend to abandon noncompetitive local parties for Duvergerian reasons. The dominant tendency is for two parties to capture most of the vote consistently at the district level (figures 1 and 2). At the national level, Duvergerian effects are found

¹³ The Samajwadi Party in Uttar Pradesh and the Janata Dal in Bihar represent similarly situated castes, and both parties are not ideologically different. Each prefers to retain its independent organization. Their cooperation at the national level in 1996 was somewhat strained. This pattern of behavior is more noticeable in some periods than in others.

when national policies matter at the local level. We would expect to see two parties at the national level only when voters have national policy preferences and when candidates who represent voters with similar preferences across districts see the obvious advantages to affiliating with other candidates.

EVIDENCE

If party aggregation is sensitive to the degree of centralization in the manner just described, then we should observe a larger difference between N_N and D_N in periods when the central government is less dominant or becoming less dominant. As D_N is expected to stay fairly constant (near two) in single-member, simple-plurality systems, most of the variance across time for India and the United States should occur with N_N . When N_N rises, it reflects increasing problems of party aggregation. This section demonstrates that patterns of party aggregation and political and economic centralization in India and the United States largely support these conclusions. In both countries, party aggregation is more successful when the national government centralizes authority.

United States

Returning to Figure 1 for the United States, before the New Deal, and especially before introduction of the national income tax in 1913, N_N fluctuates from near two to as high as 6.5 in the early nineteenth century. The periods corresponding to the Populist and Progressive movements also show expected punctuations in N_N . These patterns reflect the regional or local bases of minor parties in the United States historically. In some regions in the late nineteenth century, for example, Republicans faced their most significant opposition from Populists, while in other regions the threat came mostly from Democrats. Nationally, both Populists and Democrats aggregated noticeable numbers of votes for the House of Representatives, causing N_N to be higher for that era. In the early twentieth century, the Progressives were largely a collection of locally based parties that did not necessarily coordinate their efforts across districts and even had slightly different labels in neighboring states (Shefter 1994). In sum, before the New Deal, the national political system was one of locally rooted parties that gathered and "handed out divisible economic benefits to meet their patronage requirements" (Finegold and Skocpol 1995, 54). While these local parties often were labeled Democrat or Republican, in some places parties such as Labor, Progressive, Socialist, Prohibitionist, or Farmer were one of two locally dominant political organizations.

The political and economic centralization of the 1930s obviously had a profound effect on local politics and local economic policies. Referring to Figure 3, the dotted lines depict two economic indicators of what occurred during this time. National government spending (nondefense) as a proportion of total government spending (including state and local spending) more than doubled during the period. National government

(nondefense) spending as a proportion of GNP rose nearly tenfold from the turn of the century to the 1930s and continued to rise. The New Deal, in many ways, centralized public taxing and spending decisions.

The New Deal also centralized political authority. According to Milkis (1993, 9)¹⁴, it brought about the "nationalization of the political system . . . [and] established conditions for the emergence of a more national and programmatic party system." The new policies in some cases weakened more conservative Democratic machines in big cities, such as New York (Erie 1988, 108). But they also brought into the Democratic fold Republican Progressives in Minnesota and Farmer-Labor members in Wisconsin (Milkis 1993). They strengthened local Democratic machines in Chicago and Pittsburgh and maintained the Democratic hold on many parts of the South (Key 1949). Roosevelt's policies, in sum, marked the most substantial political and economic centralization in American history, causing voters and politicians to orient their party affiliations either in support of or in opposition to them.

After the New Deal, N_N drops to near two and stays there, as shown by the solid lines in Figure 3. Clearly, great surges in third- and fourth-party strength at the national legislative level ceased in the 1930s, causing the problem of party aggregation to recede. Our argument is simply that this aggregation pattern was driven by American voters' increasing consideration of national policies when choosing among House candidates.¹⁵ Nearly all viable legislative candidates, in response, found it increasingly in their interest to affiliate with one of the two major parties as opposed to identifying with local or regional parties.¹⁶

More systematic evidence for the relationship in the United States is presented in Table 1. Equation 1 summarizes a regression model in which the number of national parties (N_N^t) in a given election year (t) is regressed on its lag (N_N^{t-1}) and on central government spending (nondefense) as a proportion of GNP (X_t) (i.e., the data from Figure 3B). The coefficient of interest is on X_t , and it shows that X_t is negatively related to the number of national parties (and statistically significant), controlling for the previous number of national parties. This is exactly as we would expect, leading to the interpretation that greater fiscal (and by

¹⁴ Our argument is different from that of Coleman (1996), who emphasizes the civil service reform that accompanied the New Deal as a cause of party decline (as measured by party vote discipline in Congress). Our claim does not focus either on party weakness or congressional votes but merely states that, with the New Deal, national policy preferences began to dominate voting decisions in House elections.

¹⁵ This conclusion is supported by numerous studies of American electoral behavior. See Key 1949 and Burnham 1970 for classic accounts.

¹⁶ Another interesting aspect of Figure 1 is the decline in the size of surges in N_N after the Civil War, another great period of centralization. This adds evidence of the effects we highlight here. We believe that N_N declined in response to centralization during and after the Civil War and then declined further (and most completely) after the New Deal. Note, however, that most of the fluctuations in the periods prior to the New Deal are not explained here. Essentially, our argument is that once a threshold of centralization has been passed (after the New Deal), party aggregation occurs rapidly.

TABLE 1. Effects of Centralization on the Number of National Parties in the United States

Variable	Equation 1	Equation 2	Equation 3
Constant	1.23*** (0.24)	1.39*** (0.34)	1.36*** (0.28)
X_t (fiscal centralization)	-1.91* (0.97)	-2.14 (1.16)	-2.11 (1.14)
N_N^{t-1}	0.52*** (0.09)	0.62*** (0.13)	0.62*** (0.13)
N_N^{t-2}		-0.16 (0.17)	-0.18 (0.21)
N_N^{t-3}			0.03 (0.12)
n	46	46	46
F	21.10***	15.61***	16.98***
R^2	.47	.49	.49
Durbin-Watson	1.6	1.8	1.8

Note: Shown are OLS coefficients with robust standard errors in parentheses. The dependent variable is the number of national parties in election year t (N_N). The independent variable X_t is national government spending (nondefense) as a proportion of GNP (i.e., the economic data from Figure 3B). * $p < .05$, *** $p < .001$.

implication political) centralization leads to fewer national parties.¹⁷ In equations 2 and 3 in the table we explore the robustness of the result. We lag the dependent variable a second and third time to make sure that the effect of fiscal centralization does not disappear if we change the lag structure of the model. As the table shows, the estimated effect of X_t on the number of parties does not change much from the model summarized in the first column, although the probability level for the coefficients on X_t in the second and third columns goes to .07 in each.

India

The effects of the political and economic centralization that characterized Indian politics in the 1970s and 1980s are as expected. The party system moves in the direction of a two-party system nationally during much of that period. In the late 1980s, however, political centralization and the consolidation of parties were reversed, and in the 1990s India was once again a system with more than four national parties. The pattern—increasingly successful party aggregation and then a reversal—conforms well to our argument.

As evident in Figure 2, from the elections of 1957 to those of 1967, there were increases in N_N (and $N_N - D_N$). In other words, party aggregation increasingly failed in this period. Analysts have noted the weakening power of the central government, especially between 1964 and 1967, when power within the ruling Congress Party was held by a collection of state leaders,

commonly called the Syndicate (Brecher 1966; Frankel 1978; Kochanek 1968; Rudolph and Rudolph 1987). As Manor (1988a, 68) succinctly notes, in this period the center's will did not dominate, as "bargaining had long been an important element of relations between New Delhi and the states, even in Nehru's day when Congressmen held sway at both levels."

Political and economic centralization in India began with the 1971 elections. For most of the next decade and a half, Indira Gandhi, who was prime minister between 1971 and 1977 and again from 1980 to 1984, drastically centralized power and resources. "She created a pyramidal decision-making structure in party and government... [and this] centralized decision-making" (Kochanek 1976, 104). She also forged direct ties with local leaders, bypassing state leaders. Besides candidates competing formally for elective office, local elites ("brokers") are important in Indian politics.¹⁸ The incentives of these local elites to align with nationally competitive parties changed in concert with the increased dispersal of resources for rural programs by the central government (Brass 1990). As the central government augmented its role in local affairs, local elites aligned with national parties. A similar degree of political centralization was not sustained under Rajiv Gandhi from 1985 to 1989. He was unable to control even the various factions within the Congress Party (Frankel 1987, 38; Manor 1988b, 9; Weiner 1987, 15).

In addition to the well-known centralization of political power under Indira Gandhi, evidence summarized in the two panels of Figure 4 shows that economic centralization occurred as well.¹⁹ Figure 4A demonstrates that national government spending (nondefense) as a proportion of total government spending (nondefense) increased only after Indira Gandhi came to power. And national government spending (nondefense) as a proportion of GNP almost doubled during her reign (Figure 4B). The solid lines in these figures show that party aggregation moved in opposition to the economic data during every period until 1985.

The data summarized in Figure 4 for the period 1985–89 appear to run counter to our theory. During these four years, both the economic data and the number of parties move upward. The data in the late 1980s, however, are somewhat misleading. Much of the increase in national government expenditures can be attributed to larger grants to the states and union territories and to interest payments on debt, the kind of spending that need not indicate centralization of authority. Three-fifths of the growth in national government spending as a proportion of GNP between 1985 and 1989 can be attributed to these types of expenditures, a proportion that is much higher than in earlier periods.²⁰ The well-known inability of Rajiv Gandhi to

¹⁷ We also recalculated the coefficients using a Hildreth-Lu estimator (because the Durbin-Watson is 1.6). This procedure corrects for serially correlated residuals in small samples (Neter, Wasserman, and Kutner 1989, 500). The coefficient for X_t goes to -2.34 with a standard error of 1.17 ($p = .05$). The transformed Durbin-Watson is then 1.96. This result means that serial correlation does not alter the main conclusion of the model.

¹⁸ For the critical role played by brokers and local elites, see Mitra 1992 and Reddy and Haragopal 1985.

¹⁹ Hart (1976) and Manor (1994) provide evidence for the concentration of central authority in this period.

²⁰ In fact, when we use an alternative economic measure, the proportion of total government spending (as in Figure 4A) excluding debt payments, the results from statistical analysis look more consistent with our hypothesis in all periods, including these four years. For

maintain his mother's political and economic centralization is not properly reflected in these data.²¹

Accompanying the increased expenditures under Indira Gandhi was greater economic policy intervention by the central government, often in direct contradiction of prevailing political norms. For instance, although agriculture is constitutionally not the province of the central government, the share of federal spending in that sector quadrupled (India 1976). The central government also amended the constitution to deprive states of revenues from advertising on state-owned radio and television. The location of industries—both in the private and public sector—was decided by the national government. Through the 1970s and mid-1980s the central government, through schemes it sponsored, largely determined the spending priorities of state and local governments (Bagchi 1991).²²

As expected, N_N drops and there is more effective party aggregation between 1971 and 1984. Once again, however, the pattern reverses in the late 1980s because, while Indira Gandhi was relatively successful in centralizing power through the early 1980s, Rajiv Gandhi was not as adept. For instance, in 1989 he attempted to introduce the 64th Amendment to the constitution. It would have redefined government relationships, with state governments ceding a fair degree of fiscal control to local governments, whose finances would have come under the direct purview of the central government. The amendment failed in the upper house.²³

Problems with party aggregation therefore increased again, especially after 1991. As Yadav (1996, 95) notes, after 1991 the party system "cannot be aggregated at the national level." This change occurred in response to a marked decline in political and economic centralization. National government expenditures as a proportion of GNP showed a steady but small decline after 1990, and between 1991 and 1995 central government revenue expenditures declined almost 2% (India 1996b, 20). Furthermore, the changes in economic policy introduced in 1991 differed from earlier attempts to liberalize the economy in one important way: The central government has reduced its role in economic policymaking. The procedure whereby licenses to set up a manufacturing industry are granted by the central government has mostly been abolished. The states not only have greater autonomy in setting indus-

trial policy but also actively compete for investment. The central government also has altered its financial relations with the states, and its grants to the states have declined (India 1996b, 25). Not surprisingly, party aggregation appears to have decreased in this most recent period.

Because there are too few cases for meaningful regression analyses, we do not replicate Table 1 for India. We can summarize the results briefly, however. Coefficients for a regression of the number of national parties (N_N^t) on its lag (N_N^{t-1}) and on the centralization measure presented in Figure 4B reveal the same underlying pattern as in Table 1. The coefficient for fiscal centralization is negative ($-.34$, with a standard error of $.38$).²⁴ More telling for this low number of cases, perhaps, is a simple correlation of first differences between the dependent and main independent variables. Let $\delta_N = N_N^t - N_N^{t-1}$, where δ_N is the change in the number of parties and N_N^t is the same variable as in Table 1, but for India rather than for the United States. Similarly, let $\delta_X = X^t - X^{t-1}$, where δ_X is the change in centralization and X^t is the measure of centralization from either Figure 4A (with total government spending as the baseline) or Figure 4B (with GNP as the baseline). The correlations between δ_N and δ_X are negative using both measures for δ_X ($r = -.26$ for the data in Figure 4A and $r = -.29$ for the data in Figure 4B). In fact, for every period except the late 1980s, when economic centralization increased, the number of national parties decreases; when economic centralization declines, the number of national parties grows.

These data lead us to offer two conclusions. (1) For the United States, the national income tax and the centralization of economic and political power under the New Deal solidified the national two-party system. (2) For India, the centralization of political and economic power under Indira Gandhi brought about a significant reduction in the number of parties for a temporary period. Before the 1930s in the United States, and both before and after Indira Gandhi in India, candidates and voters did not coordinate party labels as effectively because local concerns were more prominent, and voters were not as concerned about the national competitiveness of local parties.

Our analysis so far has been based on a comparison of data across time within the two countries. It is worthwhile at this point to compare briefly party aggregation across the two countries. There are several noticeable differences. The United States has had a more stable number of parties at all levels than India, though it should be noted that the United States did not attain much of its present stability until a century after its founding. N_N is nearly always higher for India than for the United States during most of the twentieth

comparability with the U.S. data, we do not subtract payments on debt.

²¹ Between 1975 and 1984, for instance, except for 1977–78, when the opposition Janata Party was in power, central government grants to the states varied between 1.7% and 2.1% of GNP. In 1977–78, a prominent period of decentralization, central government grants to the states were 2.7% of GNP. This is strikingly similar to allocations made to states by Rajiv Gandhi's government, which averaged 2.7% (India 1989).

²² There are many commentaries on the centralization of expenditures in India. See, in particular, Bagchi, Bajaj, and Byrd 1992, Gulati 1987, and Lakdawala 1993.

²³ In 1992 the Congress government introduced another version (the 73rd Amendment), which was adopted. It made clear that the central government no longer had the ability to scrutinize the accounts of local governments, a right now in the hands of state governments (India 1989, 1992).

²⁴ This coefficient is derived from a Hildreth-Lu estimation procedure to correct for serial correlation among residuals. Since the estimation procedure requires that periods be evenly spaced. To transform the data appropriately, each election year was treated as an observation. Years between elections were dropped for the estimation.

century. India also has consistently a somewhat larger number of effective parties at the district level (D_N). The overall comparison can be simply summarized by saying that India has more parties than the United States.

These differences may be explained by the greater ethnic, religious, and linguistic diversity of India relative to that of the United States. There is undoubtedly some truth to this explanation. As Cox (1997) argues, "strong" electoral systems, such as single-member, simple-plurality ones, can significantly lower the number of parties, but population diversity can increase the number of parties, leading to results that are not quite in keeping with Duverger's Law, but close. Throughout recent Indian history, small ethnic parties have been competitive in elections and have garnered representation in the Lok Sabha. Ethnicity and caste are important factors in any full explanation of electoral and political outcomes in India, but they do not tell the whole story. To explain why the number of parties and the extent of party aggregation have changed over time within both countries, one must look at the fiscal relationship among levels of government. The central Indian government is less involved in economic decisions that affect voters at the local level than is the national government in the United States. For instance, to use a simple measure of federal intrusion, direct taxes levied by the national government as a proportion of GNP are much lower in India (around .02 in recent decades) than the United States (around .14 in recent decades). The United States has a far better developed welfare state and accompanying national bureaucracy than India. The average Indian has less contact with the central government than the average American. It is important to emphasize that only two countries are compared. A fuller examination of this explanation requires electoral and economic data on more single-member, simple-plurality countries.

DISCUSSION

We have drawn attention to the role played by political and economic centralization in explaining changes in the number of parties in single-member, simple-plurality systems. Like Sartori (1986), who argues that national party systems influence voter and candidate behavior in local districts, we consider national policies to be influential in the decision of local candidates to affiliate with other candidates and in the decision of voters to support local versus national parties. Taking Sartori one step farther, we attribute the emergence of national party systems that resemble local party systems to the increasing importance of the central government in the lives of voters.

Various other explanations can be offered for party aggregation. In the U.S. case, these focus on the unique institutional features of the U.S. system, such as the presidency, a strong committee system in Congress, ballot access laws, and civil service norms. For example, it has been argued that the direct election of the executive discourages the formation of third parties in

the United States or makes party aggregation easier in many kinds of systems (Cox 1997; Jones 1994; McCormick 1975; Shugart and Carey 1992). This argument, while plausible theoretically and not at all inconsistent with our own, does not account for changes over time in the United States. American party aggregation occurred only in the 1930s, although presidential elections began in 1788. Furthermore, focusing on U.S. presidential elections to measure the number of parties is misleading. Direct Duvergerian effects can indeed occur in a national election for a single office, but the legislative data reveal quite clearly that three, four, and even more parties have received a substantial proportion of votes during certain periods.

The committee system and rules of the lower house also have been suggested as discriminating against third parties. One could argue that because the committee system in the Lok Sabha is much weaker than in the House of Representatives, there are more parties in India. Greater floor action in the legislature could mean less effective coordination among legislators on agenda control and voting. While the committee systems are indeed different in the two countries, this alone cannot explain the variance in the number of parties receiving votes in legislative elections before the 1930s in the United States. In the late 1800s, members of the Populist Party often complained that they were not given the chance to speak and that the two major parties essentially divided the House and the committee assignments between themselves. Yet, this did not prevent either the emergence of third parties or the expression of voter preferences for parties that were locally competitive but nationally noncompetitive.

Ballot access rules, too, can prevent third parties from becoming competitive by raising the cost of running a campaign. We found no systematic evidence that ballot access rules changed so dramatically in the United States (non-South) in the 1930s that they caused the number of national parties to drop as it did.

The evolution of the U.S. party system has been linked directly by Shefter (1994) and indirectly by Skocpol (1995) to civil service reform. While these authors do not explicitly address any influence that the emergence of a "national civil service" may have had on the number of national parties, their explanation suggests that a national bureaucracy and a two-party system go hand in hand. Civil service reform may lead to a nationalization of issues.²⁵ Our argument is similar, but we believe a national civil service is not a sufficient condition for the emergence of national politics. The Indian bureaucracy has always been "national," yet the issues that usually dominate Indian elections and party politics are not national. It is not the existence of a national civil service but the functions it performs that determine whether national concerns will dominate local politics. In the United States, we argue, the emergence of an income tax and the welfare state were crucial to the nationalization of politics.

We end with four observations. First, political and

²⁵ Coleman (1996) makes a similar observation.

economic centralization can occur for many reasons, including a consolidation of local parties into national parties.²⁶ In other words, we do not deny the possibility that party systems cause centralization, not the other way around. Yet, the data from India and the United States show that centralization begins prior to periods of party aggregation. The patterns of low levels of N_N and centralization follow each other closely in each country. Both Franklin Roosevelt and Indira Gandhi used their position to, among other things, create more nationalized political parties (Milkis 1993; Rudolph and Rudolph 1987).

Second, while we focus on national party systems in India and the United States, the logic for party aggregation is independent of the level of government. In federal systems, these effects may occur at the state level as well.

Third, it is certainly possible, if not likely, that these effects also may occur in proportional representation systems. Centralization could depress the number of national parties in such systems for much the same reason: Local and regional parties cannot stay competitive in the national arena when voters focus attention on national policies.

Fourth, our argument is consistent with recent trends. The central government in India is ceding control over fiscal policies to the states, and the number of parties at the national level is increasing. This is exactly as we would predict. The problem of party aggregation continues in India. In the United States, the national two-party system appears to be quite stable. If recent trends in the devolution of fiscal authority to the states continue in the United States, perhaps we shall see more regionally competitive but nationally noncompetitive parties represented in Congress, and difficulties with party aggregation may re-emerge.

APPENDIX

The district and national measures for the effective number of parties in the United States were calculated using historical election data prepared by the Inter-university Consortium for Political and Social Research (1995). Nongeneral elections, contests with missing vote totals, and contests with more than one winner were dropped from the data set. In calculating the district-level measures, for each election the candidate's proportion of the vote, p_i , was calculated by dividing the candidate's vote total by the total votes for all candidates in the election. We use the formula given on page 331 for the effective number of parties (N) (Lijphart 1994, 68).

There are two other measures used in the literature: NP (see Molinar 1991) and I (see Kesselman 1966). NP puts very heavy weight on the proportion of votes for the winning party. I puts very heavy weight (relative to other measures) on smaller parties receiving low proportions of the vote. We calculated all three measures for the U.S. and Indian data. Since the fluctuations in the national data for both countries are similar across the three measures, our main conclusions are not sensitive to changes in measurement. The district measures are somewhat different for the three measures, but

N nearly always lies between the two other measures and strikes a nice middle ground conceptually. Also, N is used most often in the recent literature, so its use here makes it easier to compare our results with others.

In each case for the district elections, votes were summed over all candidates. Yearly averages were calculated using sums of these measures and a count of the total number of elections nationwide (in the data set) for each year. The "non-South" measures—used in all U.S. data reported in this paper, both for district-level and national-level analysis—exclude elections held in Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee, Texas, and Virginia. Obviously, including the South would lower D_N in the early twentieth century (though only to about 1.7). For much of American history, southern elections were held in circumstances so different from the remainder of the country that including the South in these measures would introduce many empirical and theoretical complications.

In calculating the national-level measure, to allow aggregation of votes by party, if a candidate's party was coded as either missing or unidentified, and the candidate received less than 2% of the vote, then that candidate (but not necessarily the others in the contest) was dropped from the data set. If a candidate's party was coded as either missing or unidentified, and the candidate received 2% or more of the vote, then every candidate in the election (i.e., the entire contest) was dropped from the national measure. This presents virtually no problems (few cases are dropped from any year), except for 1806. For some reason the data on the party affiliation of candidates for that year are extremely thin. All candidates except those of the (Old) Republican Party in Vermont had missing party data (for example, 266 candidates in New York had none). Thus, N_N for that year registers 1.0 (see Figure 1). This is the only year for which missing data on party affiliation is a major problem in either data set.

The source for U.S. economic data was the U.S. Department of Commerce (1975). In that volume, the figures were found in the following locations: total government outlays (Series Y457), defense outlays (Series Y458-Y460), state and local expenditures (Series Y671), and GNP (Series Y590-Y598).

The constituency-level and national measures of the effective number of parties in India were calculated using Indian election data prepared by Singh and Bose (1984, 1994) and India (1996a). The calculations used data for single-member constituencies in 16 states: Andhra Pradesh, Assam, Bihar, Gujarat, Haryana, Himachal Pradesh, Karnataka, Kerala, Madhya Pradesh, Maharashtra, Orissa, Punjab, Rajasthan, Tamilnadu, Uttar Pradesh, and West Bengal. These account for more than 95% of the country. For each constituency, N was calculated using each party's proportion of the vote total provided in the data set. Yearly averages were calculated using sums of these measures and a count of the total number of elections per year. The national-level measure was derived by calculating each party's proportion of the total number of votes for all parties in each election year, and then applying the formula for N .

Our results for India differ from those of Lijphart (1994) for two reasons. First, our data are not for the national level (as in Lijphart) but for the constituency level. To get the national measures, we aggregated across all districts. Our cut-off was 2% of total votes in each constituency; that is, candidates receiving less than 2% in any constituency were dropped from the analysis. This could be a potential problem, especially if the proportion of votes received by minor parties in any given district aggregates to, say, 10% or more. In India, this 2% cut-off led to dropping only 1.78% of the total vote

²⁶ See Skowronek (1982) and Wagner (1958) for causes of fiscal centralization.

for the average district (this varied little across election years) with a range of 0% to 30% for all districts and a standard deviation of 2.18%. Because the proportion of votes dropped was so low, neither the district calculations (D_N) nor the national calculations (N_N) were affected.

Our second and most consequential difference with Lijphart has to do with our treatment of independents. In Indian politics there are many independent candidates. In each electoral district (constituency), they were included in the district calculations (D_N) if they surpassed 2% of the vote in that district. In calculating N_N , each independent was included as a separate party. Lijphart, in contrast, includes them in his "Other Parties" category but leaves them out of the numerator, appropriately. Yet, he includes the number of independent votes in the denominator in calculating the proportion for each party. Taagepera (1997) suggests several procedures for calculating N when there is incomplete data on which parties are included in the "Other Parties" category. Here, we have complete data, and these allow for the most accurate measure available for the effective number of parties (by including each independent as a single party).

The economic data on GNP and direct taxes levied by the central government were collected from India (1992, 1996c). Chandok (1990) provides data on central and state expenditures from 1960 through 1988, and the series was completed with India (1992 and 1996c).

On the Legitimacy of National High Courts

JAMES L. GIBSON *University of Houston*

GREGORY A. CALDEIRA *The Ohio State University*

VANESSA A. BAIRD *University of Houston*

The purpose of this research is to examine theories of diffuse support and institutional legitimacy by testing hypotheses about the interrelationships among the salience of courts, satisfaction with court outputs, and diffuse support for national high courts. Like our predecessors, we are constrained by essentially cross-sectional data; unlike them, we analyze mass attitudes toward high courts in eighteen countries. Because our sample includes many countries with newly formed high courts, our cross-sectional data support several longitudinal inferences, using the age of the judicial institution as an independent variable. We discover that the U.S. Supreme Court is not unique in the esteem in which it is held and, like other courts, it profits from a tendency of people to credit it for pleasing decisions but not to penalize it for displeasing ones. Generally, older courts more successfully link specific and diffuse support, most likely due to satisfying successive, nonoverlapping constituencies.

Perhaps the most neglected subfield within comparative politics is law and courts. Despite impressive progress in understanding many aspects of cross-national politics, comparativists know pre-

cious little about the judicial and legal systems in countries outside the United States.¹ We understand little or nothing about the degree to which various judiciaries are politicized; how judges make decisions; how, whether, and to what extent those decisions are implemented; how ordinary citizens influence courts, if at all; or what effect courts have on institutions and cultures. The degree to which the field of comparative politics has ignored courts and law is as remarkable as it is regrettable.

Our ignorance is especially unfortunate since one of the most significant developments in comparative politics is the growing influence of judicial institutions in national and international politics. What Tate and Vallinder (1995, 5) call "the judicialization of politics" seems to be a truly global phenomenon and "may be or may become one of the most significant trends in late-twentieth and early-twenty-first-century government." Though the United States seems to have led the way in transforming political questions into legal questions, much the same is true in politics as diverse as Russia (Kitchin 1995), Namibia (Steytler 1995), the Philippines (Tate 1995), Canada (Epp 1996), the European Union (Weiler 1994), and Spain (Guarneri and Magalhaes n.d.). Nor does this trend toward greater judicialization show signs of abating soon.

As courts move more squarely into the political limelight, a host of new questions emerges. Among them is how these institutions relate to their constituents, especially their mass publics. Not even the most powerful courts in the world have the power of the "purse" or "sword"; with limited institutional resources, courts are therefore uncommonly dependent upon the goodwill of their constituents for both support and compliance. Indeed, since judges often make decisions contrary to the preferences of political majorities, courts, more than other political institutions, require a deep reservoir of goodwill. Without institutional legitimacy, courts find it difficult to serve as effective and consequential partners in governance.

One would find no quarrel from social scientists in

James L. Gibson is Cullen Distinguished Professor, Department of Political Science, University of Houston, Houston, TX 77204 (jgibson@uh.edu). Gregory A. Caldeira is Professor of Political Science, Ohio State University, Columbus, OH 43210-1373 (caldeira.1@osu.edu); and Vanessa A. Baird is a Ph.D. candidate, Department of Political Science, University of Houston, Houston, TX 77204 (vbaird@uh.edu).

We are indebted to the (U.S.) National Science Foundation (NSF) (SBR-9213905, SBR-9311397, SBR-9213201, and SBR-9312689) and the (German) von Humboldt Stiftung for major support for a portion of this project. We also acknowledge the assistance of the Limited-Grant-in-Aid Program at the University of Houston and the Department of Political Science, College of Social and Behavioral Sciences, and Office of Research at Ohio State University. For technical assistance we are indebted to Dominique Vancraeynest, Director, INRA, and to Anna Melich and Eric Marlier, both of the Eurobarometer. Without the extraordinary support and collaboration of Karlheinz Reif, Director, Eurobarometer, we could not have brought this project to fruition. None of these people nor any agency bears any responsibility for the results or interpretations.

The paper also uses data from a collaborative project that grew out of the Law and Society Association's "Working Group on Orientations toward Law and Normative Ordering." Ellen S. Cohn, James L. Gibson, Susan O. White, Joseph Sanders, Joan McCord, and Felice Levine were responsible for the development and implementation of the research design. Funding for the project was provided by the NSF (SES-9213237 and SBR-9311403) and the National Council for Soviet and East European Research (#810-07). Our European collaborators include Chantai Kourilsky-Augeven (France); Grazyna Skapska, Iwona Jakubowska-Branicka, and Maria Borucka-Arcetowa (Poland); Andras Sajo (Hungary); Rosemary Barbaret (Spain); and Stefka Naoumova (Bulgaria). Gennady Denisovsky, Polina Kozyreva, and Mikhail Matskovsky of the Institute of Sociology, Russian Academy of Sciences, were instrumental in conducting the Russian portion of the research. Another part of the paper relies on data collected with support from the NSF (SES-9023565), the Advanced Research Program (003652-164), the College of Social Sciences and the Limited-Grant-in-Aid Program at the University of Houston, and the USSR Academy of Sciences. Without the collaboration of our Russian colleagues, this research would not have been possible.

A number of people provided most helpful comments on earlier drafts, including Larry Baum, Erhard Blankenburg, Paul Brace, Charles Epp, John Hibbing, Bert Kritzer, Melinda Hall, Al Melone, Gad Barzilai, Marie Provine, and Jim Stimson. Of course, we assume complete responsibility for all interpretations and conclusions; none of these colleagues or agencies necessarily endorses our findings.

¹ For concurring assessments see Melone (1996, 231), Volcansek (1992), Shapiro (1980, 1993), and Jacob et al. (1996).

the United States with the foregoing sentiments. American political scientists have long evidenced concern about the mass legitimacy of judicial institutions, and a considerable volume of empirical work on mass attitudes toward U.S. courts has been reported (see Caldeira 1991 for a recent review of the literature). Outside the United States, however, social scientists have devoted little attention to how ordinary people perceive and evaluate courts (but see Barzilai, Yuchtman-Yaar, and Segal 1994). Scholars often assume, for instance, that the U.S. Supreme Court is one of the most revered (and unusual) courts in the world, but no rigorous empirical evidence exists to support that claim. Researchers commonly observe in the United States that those who are more knowledgeable about law and courts are more supportive of judicial institutions (e.g., Caldeira and Gibson 1992). But is this a universal relationship; is it invariably the case that to know courts is to love them; or is it simply that American courts are particularly lovable? How would the public have evaluated the Supreme Court during the early years of the Republic, when Jeffersonians battled the institution? Would Germans who knew much about the Nazi courts have loved them as well? And what of Germany today—do knowledgeable Germans love the Bundesverfassungsgericht? We have little idea whether the flock of important hypotheses generated by the American case has any generalizability whatsoever. This is a lacunae of significant proportions for judicial process scholars.

Moreover, the most important question in legitimacy research—how institutions acquire and sustain legitimacy—has never been investigated in cross-national judicial research. Consequently, we know little about the processes through which the accumulation of satisfaction with institutional outputs gives rise to more obdurate support. Nor do we have solid theories or persuasive empirical tests of the processes that erode institutional legitimacy. Contemporary cross-sectional analysis confined to one of the most powerful and legitimate courts in the world can tell us little about the processes leading to the acquisition, maintenance, and erosion of institutional legitimacy.

Accordingly, our goal is to broaden the study of the relationships between courts and their publics by examining mass attitudes toward the legitimacy of national high courts, mainly in Europe, East and West. Based on twenty surveys we conducted in eighteen countries in the period 1993 through 1996, we first assess the salience of these institutions to their mass publics. We then investigate the degree of support—diffuse and specific—these courts enjoy. Next, we test the conventional (U.S.) hypotheses that greater awareness of institutions increases support for them and that specific and diffuse support are connected, but not too strongly. Finally, unlike earlier researchers, we reexamine these relationships at the macro level in an effort to understand the longitudinal processes that create institutional legitimacy. Though ours is not a longitudinal study, we take advantage of a cross-section of courts that ranges from the newly minted institutions of Central and Eastern Europe (including Russia) to the

long-established courts of Great Britain, Belgium, Denmark, the Netherlands, and the United States. Given the great variability in the age of these institutions, our cross-sectional analysis can yield insights into the dynamic processes leading to the creation of institutional legitimacy. We begin by considering theories of institutional legitimacy and prior empirical findings on the origins of attitudes toward judicial institutions.

THE LEGITIMACY OF JUDICIAL INSTITUTIONS

The theory of institutional support first outlined by Easton (1965) and later pursued by a small legion of judicial scholars is now so well known that a great deal of exposition is not required. Although the literature is too diverse to sustain the extraction of rigorous summary propositions,² a few conclusions emerge.

First, support for the U.S. Supreme Court is fairly widespread (Caldeira and Gibson 1992; Gibson and Baird 1997). To be sure, public esteem oscillates a bit over time (e.g., Caldeira 1986; but see Mondak and Smithey 1997), but most Americans judge their Supreme Court to be a largely legitimate institution.

Second, although support is relatively durable, it does change in the long term, most likely in response to change in the policy outputs of the Court (Caldeira 1986). We find the clearest support for this proposition in the evolution of the opinions of African Americans toward the Supreme Court (Gibson and Caldeira 1992). After 1968, as the Court resumed its customary role as a quite conservative policymaking institution, it appears that blacks became aware of this change, and their support for the institution—even their diffuse support—diminished over time.

Third, and following from the last point, diffuse and specific support are not entirely disconnected (e.g., Adamany and Grossman 1983), at least when viewed from a longitudinal perspective. If diffuse support cushions the effect of unpopular decisions (Gibson 1989; Tyler 1990), then diffuse support can be high when specific support (approval of policy outputs) is low. Diffuse support may also be high when specific support is high, but this is not necessarily so among newly created institutions (i.e., because it has not had time to accumulate, diffuse support can be low even though specific support is high). And, of course, both specific and diffuse support can be low. When the relationship between these two forms of support is examined cross-sectionally, it is difficult to predict for any given institution whether they will be closely connected.³

Fourth, generally speaking, to know something about courts is to be favorably oriented toward them. This is, we think, one of the most interesting proposi-

² This diversity refers not only to research design (e.g., whether students or representative samples of ordinary citizens are being studied) but also to such crucial issues as the ways in which key concepts (e.g., diffuse support) are operationalized.

³ For instance, for the two concepts in the United States in 1980, Lau and Redlawsk (1996) report a correlation of .52; Caldeira and Gibson (1992), using 1987 data, report a correlation of .05; and Lau and Redlawsk (1996) claim a correlation of .34 in 1992.

tions in the literature. In some of the earliest research on this question, Casey (1974, 409) found that respondents more attentive to courts were more, not less, likely to subscribe to the mythology of judicial neutrality and objectivity in decision making (see also Murphy and Tanenhaus 1968; Murphy, Tanenhaus, and Kastner 1973). It may be that ordinary people who know little about courts have few reasons to believe that judges make decisions differently from any other politicians. Those attentive to courts come to adopt a different view, but not the view of legal realists. Greater awareness is associated with the perception that judges are different, that they rely on law not values in making decisions, that they are "objective." Greater awareness of the institution thus creates a less realistic view of the nature of judging, a view that contributes mightily to the legitimacy of the courts (Tyler and Mitchell 1994).

How might citizens acquire this picture of judging? Here we can draw on recent scholarship about the effect of "framing" on political and social attitudes. Framing "is the process by which a . . . source . . . defines and constructs a political issue or public controversy" (Nelson, Clawson, and Oxley 1997, 567). By framing an issue in a certain fashion, an actor defines its causes and consequences and sets out the criteria for evaluating the correctness of the solution (Nelson and Kinder 1996). Perhaps citizens adopt an uncritical and unrealistic view because it is the view that judges themselves promulgate. Courts and judges in civil law nations seek to appear to render formalistic opinions, relying heavily on symbols. Judges in the United States take great pains, at least in constitutional law, to frame decision making as a process of deducing outcomes from first principles—original intent, literal words, legal precedent, and so on. Consider Justice Scalia's statement in a recent opinion: "To hold a governmental act to be unconstitutional is not to announce that we forbid it, but that the *Constitution* forbids it" (*American Trucking Association v. Smith*, 110 LED. 2d 148, 1990, at 174, emphasis in original). When ordinary people hear judges of the nation's highest court frame their decisions in this fashion, they often believe the justices' account of why they made the decision (Hoekstra and Segal 1996). Simply put, to know courts is to love them, because to know them is to be exposed to a series of legitimizing messages focused on the symbols of justice, judicial objectivity, and impartiality.

Finally, the slow accretion of positive messages about courts and law leads to legitimacy. Though only a single longitudinal study has been conducted at the micro level (Tanenhaus and Murphy 1981), scholars nonetheless agree that diffuse support is an attitude that evolves over time. Preadult socialization most likely results in positive predispositions toward courts and the legal system, since law is typically presented as a benevolent rather than malevolent institution (Caldeira 1977; Easton 1965; Easton and Dennis 1969). The "crystallization" of approving attitudes toward institutions probably then results from a continuous stream of reinforcing stimuli (Jennings 1989). As citizens move from adolescence to adulthood, attitudes acquire "affective mass," largely through learning and

habituation (Jennings 1989, 315). The acquisition of experience, reinforcement, and so on, creates relative attitude stability among adults. Lodge and Taber (1997) refer to this as the accumulation of a "running tally," an apt term to describe the cumulative nature of diffuse support (see also Hibbing and Theiss-Morse 1995, 13).

This model most likely describes the process through which West Germans acquired deep attachments to democratic institutions following World War II (e.g., Boynton and Loewenberg 1973). In the immediate post-war period, democratic loyalties were assuredly anemic and, at best, confined to relatively abstract attitudes. The process of crystallization had not yet occurred; nor had a "running tally" accumulated in the minds of the German people. But as the political system succeeded repeatedly over time, commitment to democratic government became more deep-seated. After about a generation of effectiveness, the political system could afford to fail periodically, since it had acquired a reservoir of goodwill. Had the system failed to produce in the late 1940s or early 1950s, it is unlikely that the Germans would have been so forgiving of the fledgling democratic regime. Thus, in the scheme of long-term change, the development of diffuse support for an institution requires a long and relatively consistent stream of satisfactory institutional outputs (see also Giles and Lancaster 1989).

Unfortunately, thinking of diffuse support in this way renders it resistant to empirical investigation. Not only would a lengthy time series at the micro level be necessary, but also the optimal series would have to be concentrated in (or at least include) the period in which the institution is born. This means that cases such as the United States are particularly unrevealing when it comes to analyzing the origins of diffuse support. Scholars have made creative efforts at longitudinal analysis within the United States (e.g., Mondak and Smithey 1997), but data limitations seriously hinder theoretical and empirical progress on this front.⁴

Cross-national analysis is a viable alternative to a longitudinal research design, especially if the sample of nations includes a heterogeneous array of institutions. By examining attitudes toward a variety of institutions—some relatively new, some in existence for only a few generations, and some with clearly established legitimacy—we may be able to derive insights into the longitudinal processes involved in the development of diffuse support. As noted above, the nature of the connection between specific and diffuse support is heavily contingent upon whether people already have established attitudes toward the institution or whether the institution is relatively unknown. Longitudinal analysis is the most effective (but difficult) way of assessing this relationship. Since changes in the world

⁴ An important exception is institutions that function for a long period in secrecy or anonymity but then receive public scrutiny and thereby enter the public domain (e.g., the European Court of Justice). For analyses of diffuse support, the point at which the institution becomes salient to the mass public constitutes the point at which the institution is "created."

have created a virtual laboratory for analyzing the evolution of diffuse support, cross-national research can make a noteworthy contribution as well. That is our central purpose here.

The microlevel model we test in this article is fairly simple.

HYPOTHESIS 1: *As knowledge and awareness of a court increases, diffuse support for it is likely to increase as well.*

HYPOTHESIS 2: *As satisfaction with the policy outputs of a court increases, diffuse support for it is likely to increase as well.*

RESEARCH DESIGN

Our data come from two separate but related projects. The first involved surveys in each country of the European Union in conjunction with research on mass attitudes toward the European Court of Justice and the national high courts in the EU member states. The data we employ here are drawn from a 1993 reinterview of the respondents in the 1992 Eurobarometer, the semi-annual mass survey of the Commission of the European Communities. The Eurobarometer surveys are representative of the populations, age 15 years and older, of the respective countries. In 1993 we reinterviewed subsamples of the 1992 Eurobarometer respondents. The reinterviews were by telephone, except in Ireland, Portugal, and East Germany, where telephone penetration was not sufficiently high to ensure representative samples. Since national law made it impossible to reinterview the Danish respondents, a fresh sample was drawn in Denmark. A number of methodological issues concerning the panel are addressed in Gibson and Caldeira 1995, 1998; and Caldeira and Gibson 1995.⁵

The second set of surveys was conducted in 1995 and 1996 in six European countries and the United States in connection with a project on law, legal consciousness, and democratization. Representative samples of the mass public were interviewed in person in Bulgaria, Hungary, Poland, Russia, France, and Spain and by telephone in the United States (see Gibson 1998 for details). France and Spain were included in both projects.⁶ The two projects had different purposes, but the items measuring attitudes toward national high courts are identical. Thus, although we must be mindful that the surveys occurred at various times during 1993–95, in all important respects they are comparable.

In some countries, which institution is the high court is not clear. For example, the Constitutional Council in

TABLE 1. National High Courts

Country	National High Court	Year of Creation
Belgium	Hof van Cassatie (Cour de Cassation)	1831
Bulgaria	Kohctutyzoheh Cad	1991
Denmark	Højesteret	1753
France	Cour de Cassation	1790
Germany (East)	Bundesverfassungsgericht	1990
Germany (West)	Bundesverfassungsgericht	1949
Greece	Anótato Eidikó Dikastério	1975
Hungary	Alkotmánybíróság	1990
Ireland	Supreme Court of Ireland (Chúirt Uachtarach)	1924
Italy	Corte Costituzionale	1956
Luxembourg	Cour Supérieure de Justice	1868
The Netherlands	De Hoge Raad der Nederlanden	1838
Poland	Sad Najwyższy	1984
Portugal	Tribunal Constitucional	1982
Russia	Verkhovniy Sud	1993
Spain	Tribunal Constitucional	1979
United Kingdom	Court of Appeal	1876
United States	Supreme Court	1790

France exercises a form of judicial review but is not a court; French courts cannot exercise judicial review (Provine 1996; Stone 1994). Consequently, we chose the Cour de Cassation as our target because we thought that some French respondents might not accept the designation of the Conseil Constitutionnel as a court. In nine of the countries (including Germany, Portugal, Spain, and Italy), two or more high courts divide the functions performed by the U.S. Supreme Court. For six of those nine nations, we designated the constitutional court as the court of interest; in three (Russia, Hungary, and Poland) we selected the supreme court because it was the more salient at the time the survey was conducted. In all other nations, we opted for the highest court exercising judicial review or, in its absence, the highest court exercising appellate review. Table 1 lists these institutions.

Our sample of courts varies on several dimensions. (1) These judicial institutions range considerably in political importance, from the Supreme Court of the United States and the Bundesverfassungsgericht (Kommers 1989) at one pole, to the Cour Supérieure de Justice of Luxembourg, Belgium's Hof van Cassatie (Verougstraete 1992), and the Cour de Cassation of France (Provine 1996) at the other. (2) The "births" of the courts occurred over more than two centuries, from 1753 in Denmark to 1993 in Russia. Eleven of these institutions were created before World War II, nine after (mean year of founding = 1911, median year = 1952). (3) They also differ in "political age," the age at which they began to make decisions of interest to the political community and especially the mass public. (4) These courts also possess different combinations of formal powers. Some specialize in constitutional review (Spain, Portugal, Italy, Germany, Greece; see Cappel-

⁵ This survey was connected to the EU's Eurobarometer, and as such, separate samples for East and West Germany were drawn. Following common practice, we analyze the two samples separately. Although the two portions of Germany were reunified by 1993, when the survey was conducted, the levels of exposure to the Federal Constitutional Court were quite different among East and West Germans. We take advantage of these differences in testing our hypotheses concerning the development of institutional legitimacy.

⁶ In the macro-level analysis (below), we weight each of these samples at .5, so as not to "overrepresent" these two countries.

letti 1989); others blend the functions of judicial review of legislation and of lower courts (Ireland, the United States, Denmark, Hungary, Poland, Russia); others exercise only the power to review the decisions of inferior courts (France, Belgium, Luxembourg, United Kingdom).⁷ (5) The legal systems in our sample come from several different "legal families" (see David and Brierly 1978)—common law (United States, Great Britain, Ireland), civil law (France, German, Spain, and others), and mixtures of civil and socialist law (Poland, Hungary, Russia).

These institutions vary in political centrality and importance, but all make decisions of interest to ordinary people. We lack the space to provide even a modest sampling of the outputs from these courts (see Landfried 1988), but here are a few examples of these high courts at work.

- In 1996, the Irish Supreme Court accepted an appeal challenging the recent referendum approving a constitutional amendment to permit divorce. Prior to the appeal, the Court had ordered the government to stop spending money to run advertisements in favor of the referendum (Parkin 1996). Both actions had the effect of delaying a majority intent on liberalizing divorce.
- In 1995, the Constitutional Court of Bulgaria struck down a provision of the state's budget as a violation of judicial independence—the sixth time since the previous elections the judges had invalidated a statute. The law placed the Ministry of Justice in charge of funding the Supreme Judicial Council, which appoints judges, prosecutors, and investigators (Mellone 1996).
- The Supreme Court of the Russian Federation found in 1996 in favor of Greenpeace and overturned President Yeltsin's decree permitting the importation of nuclear waste into Russia. The government had hoped to use funds earned from the processing of imported nuclear waste to finance the completion of a processing plant in Krasnoyarsk (Grushina 1996).
- The Supreme Court of Poland upheld the presidential election of November 1996 and declared Kwasniewski the winner, despite his violation of electoral law by giving false information about his educational background. The justices unanimously agreed on the violation but disagreed on whether it had made any difference in the election outcome (Karpinski 1995).

In sum, the decisions of high courts in Europe make a difference for both the leaders and the led in society, affecting matters of high policy—such as the waste site

in Russia—and the details of everyday life—such as divorce in Ireland.

THE STATISTICAL ANALYSIS

Awareness of National High Courts

We first asked the respondents about their level of awareness of their national high court. Table 2 reports the results.

Although there is considerable cross-national variability, most high courts are reasonably well known. At one extreme lies West Germany, where nearly half the respondents claimed to be very aware of the Bundesverfassungsgericht. Other countries in which awareness is widespread include Great Britain, the United States, Ireland, the former East Germany, Denmark, and perhaps Spain as well. It is interesting to note that awareness of the U.S. Supreme Court is quite high when compared with most other countries, even if awareness is higher (or as high) in a few countries. In Germany, Great Britain, and the United States, more than four-fifths of the respondents claimed at least a moderate degree of consciousness of the highest national court. Countries in which the highest court has very little visibility include Russia (the most extreme case, by far), Bulgaria, Luxembourg, Portugal, and perhaps France as well. We should reiterate, however, that substantial cross-national differences exist in the visibility of the national high court ($\eta = .50$). Strikingly, when we combine the two highest levels of awareness, the percentage fairly aware of the national high court ranges from a low of 17.6 in Russia to a high of 85.9 in West Germany.

Even a cursory examination of Table 2 reveals that awareness is not necessarily related to the age of the institution. With the exception of Russia, awareness of the high court in some of the new democracies is not particularly low. In Hungary, for instance, awareness is about the same as in the Netherlands and Greece; Poland is comparable to Italy; and Bulgaria is similar to Luxembourg. We will investigate this relationship more rigorously below, but it is clear that there is not necessarily a strong relationship between the age of the institution and its salience within the mass public.

Awareness of the national high courts may indicate something of their politicization. After all, these courts become known primarily when they make decisions that attract mass media attention. Rulings on arcane legal issues are unlikely to interest many; decisions on issues of public law—Sunday closing, abortion, gender equality—are much more likely to penetrate public consciousness. To the extent that a court is salient, it probably has made decisions of interest and concern to ordinary people.

For most of the following analysis, we put aside those respondents who are insufficiently aware of their national high court to have meaningful opinions (the first and second columns in Table 2). We do not contend that their views are always unimportant (see Gibson and Caldeira 1995), but for purposes of our analysis it is prudent not to include those who are oblivious to the

⁷ European Union law puts this statement about national courts without the power of judicial review in a more complex light. So, for example, although the courts of appeal do not have the power to invalidate a parliamentary law in conflict with the British "constitution," they may do so if the legislation conflicts with European law. Furthermore, as Alivizatos (1995) points out, courts without judicial review may accomplish much the same outcome by interpreting the parliamentary law in conformity with the constitution.

TABLE 2. Awareness of National High Courts

Court	Level of Awareness ^a					Mean	Std. Dev.	N
	Percentage							
	Never Heard of	Don't Know	Not Very Aware	Somewhat Aware	Very Aware			
Russia	50.8	2.2	29.4	17.0	.6	.7	.77	772
Bulgaria	13.4	13.7	47.9	22.7	2.0	1.1	.69	1,183
Luxembourg	25.0	2.5	46.0	17.5	9.0	1.1	.89	200
Belgium	9.2	6.0	56.6	23.3	4.8	1.2	.70	249
France (1993)	7.6	.0	69.4	20.3	2.7	1.2	.60	301
France (1995)	9.2	3.7	64.8	18.1	4.2	1.2	.65	759
Portugal	17.7	4.0	45.0	30.3	3.0	1.2	.76	300
Italy	9.0	.7	54.3	31.0	5.0	1.3	.71	300
Poland	11.7	3.0	50.8	27.9	6.6	1.3	.77	821
Greece	6.1	3.5	51.1	32.5	6.8	1.4	.72	311
Hungary	9.0	1.4	48.3	37.7	3.6	1.4	.70	785
Spain (1995)	10.7	3.8	35.8	43.2	6.5	1.4	.79	773
The Netherlands	6.0	.0	55.3	36.0	2.7	1.4	.64	300
Spain (1993)	10.3	3.7	27.3	35.7	23.0	1.7	.95	300
Denmark	1.3	.3	26.7	62.0	9.7	1.8	.62	300
Germany (East)	1.0	1.3	27.5	52.8	17.5	1.9	.71	309
Ireland	1.6	7.8	22.1	44.5	24.0	1.9	.83	321
Great Britain	1.7	.0	11.3	55.3	31.7	2.2	.69	300
United States	.6	.1	16.8	49.8	32.7	2.2	.71	810
Germany (West)	1.5	.5	12.1	38.4	47.5	2.3	.76	198

Note: Countries are rank ordered on the mean level of awareness. In the first five columns, each row totals to 100%, except for rounding errors. The range of the variable "awareness" is from 0 to 3.

^aThe question read: "And what about the [HIGHEST COURT OF THE COUNTRY], that is, one of the [NATIONALITY] courts? Would you say that you are very aware, somewhat aware, not very aware, or have you never heard of the [HIGHEST COURT OF THE COUNTRY]?"

institution.⁸ Furthermore, with the exception of Russia (on which we comment below), the proportion of the total country sample excluded from the analysis is relatively small and inconsequential. Following earlier research (e.g., Caldeira and Gibson 1992, 1995), we refer to this culled sample as the "attentive public" of the institution.

Specific Support

Table 3 reports the levels of specific support among attentive publics for the national high court, using as a measure overall satisfaction with the performance of the institution. The cross-national differences in awareness of the high courts among their general publics (Table 2) are generally much smaller than the cross-national differences in specific support among attentive publics (Table 3). Among the attentive publics, satisfaction with the performance of the national high court is fairly high. In contrast to awareness, specific support seems to be relatively low in the new democracies of Central and Eastern Europe, even when the respondents who expressed no judgment are excluded. Satisfaction with the U.S. Supreme Court is certainly substantial but pales in comparison to the Danish or Dutch

high courts, for instance. Few people are extremely pleased with their national high courts, but few are very displeased. The balance of satisfied to unsatisfied opinion varies by country, with dissatisfaction predominating among the populaces in countries with younger courts, and satisfaction being more common among older courts. The average of the country means is 1.7, which is below the mid-point on the satisfaction scale.

Diffuse Support

Our conceptualization of diffuse support follows prior work in the area; it is "institutional commitment," an "unwillingness to make or accept fundamental changes in the functions of the institution" (Caldeira and Gibson 1992, 638). We have used three items to measure diffuse support for the national high courts, and the responses are reported in Table 4. The propositions put to the respondents closely mirror our conceptualization of diffuse support, with the first item in the table being the clearest and most direct operationalization. If one agrees that it may be better to do away with the court because its decisions displease the majority, then obviously one is not supportive of the institution. Similarly, support is indicated by willingness to defend the court's jurisdiction, as well as by generalized trust in the institution.

There is a great deal of variability across countries in diffuse support of the national high courts. Consider institutional commitment, which among the attentive

⁸ The replies of those who claimed little or no awareness are most likely dominated by random variation. Excluding them may restrict somewhat the theoretical variation in the correlation coefficients (although not the empirical variance in the items, since these respondents tended overwhelmingly to give "don't know" responses to our substantive questions), but we believe their exclusion is necessary when analyzing attitudes toward the national high court.

TABLE 3. Specific Support (Satisfaction) with National High Court among Attentive Publics

Court	Level of Specific Support (Satisfaction) ^a					Mean	Std. Dev.	N
	Percentage							
	Not at All	Not Very	Don't Know	Somewhat	Very			
Bulgaria	13.9	37.6	25.0	22.8	.7	1.2	.63	856
Russia	8.3	41.1	35.0	15.3	.3	1.3	.52	360
Poland	6.3	36.2	25.7	30.2	1.6	1.4	.58	693
Hungary	5.7	44.6	10.0	37.8	1.4	1.4	.61	699
Germany (East)	6.6	36.4	23.2	31.1	2.6	1.4	.61	302
France (1995)	6.3	19.4	34.9	36.5	2.9	1.5	.59	650
Spain (1995)	5.9	23.2	28.5	38.0	4.4	1.6	.62	656
Italy	4.1	31.0	16.2	45.4	3.3	1.6	.60	271
Spain (1993)	9.7	14.7	24.8	43.4	7.4	1.6	.72	258
Greece	8.9	19.2	15.7	48.0	8.2	1.6	.73	281
Portugal	3.4	12.8	34.5	47.7	1.7	1.7	.50	235
France (1993)	1.1	11.5	45.0	41.0	1.4	1.7	.41	278
Belgium	3.3	16.6	27.5	46.4	6.2	1.7	.58	211
United States	5.5	19.3	5.4	61.3	8.6	1.8	.67	803
Great Britain	3.4	11.9	19.7	55.9	9.2	1.8	.60	295
Ireland	3.8	11.3	24.7	46.7	13.4	1.8	.66	291
Germany (West)	2.1	11.9	11.9	55.7	18.6	2.0	.65	194
The Netherlands	1.1	6.0	12.1	68.4	12.4	2.0	.51	282
Luxembourg	1.4	9.7	21.4	44.1	23.4	2.0	.67	145
Denmark	1.4	3.4	12.2	55.4	27.6	2.2	.61	294

Note: Countries are rank ordered on the mean level of satisfaction. In the first five columns, each row totals to 100%, except for rounding errors. The range of the variable "satisfaction" is from 0 to 3.

^aIn the 1995 survey, the question read: "From what you have heard or read, would you say that you are very satisfied or not satisfied at all with the way the [HIGHEST COURT OF THE COUNTRY] has been working?" In the 1993 survey, the question read: "Now, returning to the [HIGHEST COURT OF THE COUNTRY], would you say that you are very satisfied or not satisfied at all with the way the [HIGHEST COURT OF THE COUNTRY] has been working?"

publics ranges from a low of 18.6% in Bulgaria to a high of 76.0% in the United States. In less than half the countries, a majority of respondents support their national high court. In nine cases—Belgium, Spain (1993), Ireland, Luxembourg, Germany (East), Bulgaria, France (1995), Hungary, and Spain (1995)—there are more opponents of the court than supporters. In most countries, there is even less support in terms of willingness to protect the jurisdiction of the national high court. Yet, trust in the national high court is quite widespread in most countries, with, for instance, an astounding 89.0% of the Dutch expressing some trust in the De Hoge Raad. Apparently, people trust their national high court even if they support reigning it in or even abolishing it should it fail to perform satisfactorily over a long period.

To simplify comparisons across countries, we have created a three-item summated index of support, standardized on a 100-point scale. Table 5 reports the means and standard deviations for each country.⁹ According to this index, the Dutch are the most supportive of their national high court; the Spanish (1993) are least supportive; and the Italians and Hungarians score at the middle of the twenty countries. Our data generally indicate that these national high courts vary considerably in the level of legitimacy they have achieved

($\eta = .28$). Many have a bedrock of support, but many, perhaps more, do not.

The data in Table 5 provide an enlightening perspective on the U.S. Supreme Court. It is certainly a widely supported institution in the United States, but, in comparative perspective, it is not inordinately well supported. The high courts of the Netherlands, Denmark, Germany (among West Germans), Greece, and even Poland have at least as much institutional legitimacy as the Supreme Court. Though we must be mindful that there are some slight differences in the percentages of the samples that are inattentive to the courts (few of these countries has as broad an attentive public as the United States), the U.S. Supreme Court does not have an exceptionally deep reservoir of goodwill among its mass public.

Connecting Awareness and Diffuse Support

To what degree does increased awareness of the national high court contribute to increased support for the institution? Research from the United States strongly suggests that greater awareness of the Supreme Court directly translates into greater support for it. This is not necessarily because the people who become aware of the Court invariably discover that it is making desirable public policy. Instead, we hypothesize that greater awareness means greater exposure to the legitimizing symbols associated with high courts. Thus, we expect that awareness and support are positively

⁹ The three items are moderately intercorrelated. The mean for the 20 countries of the average interitem correlation (within country) is .24 (standard deviation .08), with a minimum of .10 and a maximum of .44.

correlated. The data relevant to this hypothesis are given in Table 6.

Table 6 shows widely varying relationships between awareness of the national high court and support for it. The connection is strongest in Belgium ($b = 12.0$), where predicted diffuse support varies from 47.5% for the least aware to 71.5% for the most aware (data not shown). The relationship is also quite strong in the Netherlands and France (1993). In Luxembourg and Bulgaria, the coefficient is slightly negative (although not statistically significant), and awareness and support are completely unrelated in Russia. The average of the unstandardized regression coefficients is 5.5 (standard deviation = 4.1). To know a court is not necessarily to love it, but generally there is a

fairly strong tendency in most countries for the more aware to be more supportive of their national high court.

The intercepts reported in Table 6 are also interesting since they represent the expected level of diffuse support when there is little awareness of the national high court. In France (1995), support was low among those without much awareness of the Cour de Cassation, but support was a great deal higher among the uninformed Dutch. Perhaps we can interpret these intercepts as the effect of preadulthood socialization—the level of support for the courts that develops before exposure to any information about the institution. In nearly all the countries, increased awareness results in greater diffuse support for the high court.

Spain (1995)	14.8	33.7	51.5	3.4	.89	656
The Netherlands	4.6	6.4	89.0	4.3	.82	282
United States	25.1	9.6	65.3	3.4	1.03	804

Note: In the first three columns each row totals to 100%, except for rounding errors. The data were collected with a Likert scale, ranging from strongly agree to strongly disagree. For the percentage distributions in this table, strong and moderate responses are collapsed into "Supportive" or "Not Supportive." All items are scored so that a high number equals a supportive response. The nature of the supportive response is shown below in parentheses for each item.

^aCourt Jurisdiction: The right of the [HIGHEST COURT OF THE COUNTRY] to decide certain types of controversial issues should be reduced. (Disagree)

^bInstitutional Commitment: If the [HIGHEST COURT OF THE COUNTRY] started making a lot of decisions that most people disagreed with, it might be better to do away with the [HIGHEST COURT OF THE COUNTRY] altogether. (Disagree)

^cTrust: The [HIGHEST COURT OF THE COUNTRY] can usually be trusted to make decisions that are right for the country as a whole. (Agree)

Connecting Specific and Diffuse Support

Table 7 reports the regression coefficients connecting specific and diffuse support. As we expected, the coefficients are generally positive—those more satisfied with the current performance of the institution are more likely to extend diffuse support to it—but, also as expected, the relationships differ considerably in strength. In Greece, West Germany, the Netherlands, and the former East Germany, diffuse support closely mirrors specific support. In Russia, the two types of support are unconnected, and in Luxembourg and Spain (1995), they are not strongly related. The average unstandardized coefficient is 11.5, producing a range of nearly 46 points on the 100-point diffuse support scale from the lowest to highest level of specific support. At least at the bivariate level, awareness of the high court is not nearly as strong a predictor of diffuse support as is specific support.

With cross-sectional data, it is not entirely clear how to understand the relationship between diffuse and specific support. Consider the case of the United States, where those who are satisfied with the outputs of the Supreme Court generally support the institution. But this does not necessarily mean that support would fall if satisfaction were to decline. Indeed, according to the theory of diffuse support, only prolonged dissatisfaction would erode levels of dif-

TABLE 5. Average Diffuse Support for National High Court among Attentive Publics

	Index of Support		N
	Mean	Std. Dev.	
Spain (1993)	46.3	22.3	258

fuse support. At any given time, diffuse and specific support may be positively related, negatively related, or even unrelated.¹⁰

The intercepts reported in Table 7 represent the levels of diffuse support when dissatisfaction with the outputs of the institution is total. In some respects, this reflects the hardest core of support for the institution. Among East Germans with no satisfaction with the policy outputs of the high court, there is very little diffuse support. Contrariwise, there is a great deal of support even in the absence of satisfaction in Russia, Poland, Luxembourg, and Spain (1995). The U.S. Supreme Court has a fairly large core of support: Roughly two out of five Americans who are completely unhappy with the Court's policy outputs nonetheless express support for the institution.

The multivariate results, reported in Table 8, are virtually identical to the bivariate results in terms of the relationship between diffuse support and satisfaction. Comparing Table 8 with Table 7, we observe that in none of the cases in which there is a significant relationship between diffuse support and satisfaction did the significance of the relationship attenuate. Therefore, satisfaction maintains an independent effect on diffuse support, even when controlling for aware-

ness. Yet, among the seventeen countries that exhibited a significant bivariate relationship between diffuse support and awareness, in only five (Spain 1993, France 1993 and 1995, Belgium, and Great Britain) does the effect of awareness remain significant when controlling for satisfaction. Thus, we can conclude that awareness is correlated with diffuse support but is generally mediated by the effect of satisfaction, which has the primary independent effect. People become satisfied with the court's policy outputs by being aware of its policies. This lends support to the positivity bias hypothesis, which is well known in the political psychology literature.

Summary

We have discovered considerable cross-national variability in mass attitudes toward national high courts. These institutions are in general relatively salient, and most mass publics are satisfied with the outputs of the institutions. Moreover, awareness of the high court generally creates diffuse support, and specific support leads to diffuse support as well. These data are not dispositive on the processes leading to the cross-sectional results, but they are entirely compatible with our understanding of how institutional legitimacy becomes established. The macro analysis will shed some light on the dynamic nature of this process.

MACRO ANALYSIS

Perhaps the most interesting and unusual questions we can address with these data are those framed at the macro level, using the court and/or political system as the unit of analysis. In moving to the macro level, we

¹⁰ Due to selective perception and cognitive dissonance reduction, those who support an institution are more likely to perceive its policy outputs favorably. Thus, in general, we hypothesize some degree of positive correlation between diffuse and specific support. Perhaps the most worrisome relationship is a very strong correlation between the two forms of support, since this may mean that the measures are not capturing the difference between the two concepts. Still, a highly legitimate court whose policy outputs please most of its constituents could produce a reasonably strong correlation between the two attitudes.

use the micro-level survey data to derive indicators of the attributes of the national high courts. Thus, average scores on diffuse support represent institutional legitimacy, awareness reflects the degree to which the court has made decisions of interest to ordinary people (the salience of the institution), and so forth. Though the number of cases is relatively small, perhaps something can be learned from careful and restrained analysis at the macro level.

Figure 1 reports the bivariate relationships among the three principal systemic variables—institutional legitimacy, satisfaction with court outputs (specific support), and institutional salience.¹¹ Several relationships are noteworthy. First, the salience of the national high court is moderately related to satisfaction with its outputs ($r = .50$). Generally, courts become visible not through controversial decisions that most people oppose but by ruling in a direction pleasing to the majority.

But salience does not necessarily directly increase

institutional legitimacy ($r = .20$). To know a court is to be pleased with its policy outputs but not necessarily to love the institution (in the sense of granting it legiti-

FIGURE 1. Macro-Level Relationships among Institutional Age, Salience, Satisfaction, and Legitimacy

Note: Entries are bivariate correlation coefficients. Weighted *N* = 18.

¹¹ The duplication of France and Spain in the macro-level data analysis creates certain statistical problems, since the observations are not strictly independent. We have not implemented the typical corrections for such dependence because we are little concerned with inferential statistics here. In no sense are these 20 observations representative of any larger group of courts, and we are mindful, indeed, of the dangers of generalizing from this particular sample.

FIGURE 2. Relationship between Institutional Legitimacy of and Policy Satisfaction with National High Courts among Attentive Publics

macy). The primary importance of salience lies in its contribution to satisfaction with institutional outputs.

At the level of the individual citizen, diffuse and specific support are only moderately related in most nations; at the level of the political system, satisfaction with court outputs is strongly related to institutional legitimacy ($r = .60$). Figure 2 displays this relationship in more detail. Courts in the nations above the regression line have a reservoir of legitimacy in excess of what we would expect, based upon the aggregate level of specific support for the institution's policies; in this category are Poland, Greece, and the Netherlands. Courts below the line have less legitimacy than anticipated as a result of the effect of satisfaction; Spain in 1993 is the most striking instance. Generally, to the extent these institutions generate policy outputs pleasing to most people, on average, they have a greater store of institutional legitimacy.

The coefficients in Figure 1 may well reflect the cross-sectional residue of a longitudinal process. Over time, courts may gain visibility by making a series of decisions pleasing to various constituencies. Contemporary approval may therefore reflect the summation of approval over the years, and it may indicate that a succession of constituents has been satisfied over time.

Why are court decisions generally pleasing rather than displeasing? Courts, in contrast to parliaments, are able to frame decisions as being required by a constitution or laws, and thus place their policies on a procedural rather than a substantive plane. This framing creates an asymmetry in the relationship between diffuse and specific support: Courts garner legitimacy from pleasing decisions but lose little or nothing from displeasing decisions, since they can transfer responsibility for unpopular decisions to the "law." In this sense, courts do not suffer from negativity bias, the common tendency for negative policy outputs to be more readily noticed than positive outputs.¹² As satisfaction with the policy outputs accumulates, institutional legitimacy grows. Institutional salience is not necessarily related to legitimacy at any given time; instead, salience is associated with knowing about and approving of judicial outputs, which is different from, even though connected to, extending legitimacy to the institution.

To what degree are any of these relationships a function of the age of the institution? Some of these

¹² This is contrary to some earlier work in other subfields. See, for example, Skowronski and Carlston 1989 and especially Lau 1985.

courts came into existence two centuries ago (e.g., the U.S. Supreme Court); others were established only very shortly before the surveys (e.g., Russia). It is reasonable to hypothesize that, *ceteris paribus*, the longevity of the institution has something to do with how ordinary people feel about it.

As also shown in Figure 1, the salience of the national high court is only moderately related to its age ($r = .40$), probably because chronological age is not equivalent to political age.¹³ As we noted above, the important factor may be how long the institution has been in the public eye. Longevity may contribute only moderately to visibility, since even very old courts have only recently moved into the public spotlight. Moreover, salience may not contribute to a running tally in the same way as it generates satisfaction. It is possible that simply becoming salient to the mass public does not necessarily leave a residue on mass consciousness. We suspect that people may remember that they approve of the actions of the institution, and their running tally may reflect an increment or a decrement due to some earlier decision, but people do not keep track of how salient institutions are or have been (Lodge and Taber n.d.).

There is a very strong relationship ($r = .80$) between the age of the court and the level of satisfaction with its outputs. Apparently, courts that function for some time develop satisfied constituencies. This may be due to learning how to please constituents, or satisfaction may reflect not only contemporary evaluations but also the accumulation of satisfaction over time.¹⁴ We speculate that although courts may be minoritarian institutions, if they are able to please a series of minorities, then they may gradually draw the support of a majority by assembling what amounts to a "coalition of minorities."

The age of a national high court is not very strongly related to legitimacy ($r = .36$). Consonant with the expectation that time alone does not directly enhance support, controlling for satisfaction completely reduces the relationship to statistical and substantive insignificance. What is important for the legitimacy of national high courts is the accumulation of satisfied constituents, not the accumulation of years. As satisfaction accumulates, a more enduring allegiance to the institution develops.

One implication of this hypothesized process is that the degree of connection between satisfaction with policy outputs and institutional legitimacy should increase over time. *Within a system*, the accumulation of specific support, rather than the absolute level of support at any given moment, shapes legitimacy. *Across systems*, the degree of connection between output satisfaction and legitimacy should therefore be contingent upon the age of the institution, especially in light

of the strong relationship between longevity and satisfaction with policy.

To test this hypothesis, we use the unstandardized micro-level coefficients that resulted from regressing diffuse support on specific support (Table 7) as the macro measure of the rate at which policy satisfaction translates into institutional legitimacy. The correlation between these coefficients and the age of the national high court is only .21; although specific support and institutional legitimacy are more closely connected among older courts, the relationship is modest.¹⁵ Older courts, on balance, tend to be more legitimate, and they tend to have more accumulated specific support, which more readily translates into institutional legitimacy.

Not much of this relationship is linear; instead, we find a large threshold effect. Specifically, there is a remarkable difference in the strength of the correlation between specific support and legitimacy depending on the institution's age. The courts are easily divided into two groups: nine younger than thirty years and eleven older than that. Among the former, the correlation between specific and diffuse support is .29; among the latter it is .72. This is a stunning difference in the magnitude of the relationship. Policy satisfaction and institutional legitimacy are more successfully linked in older institutions than in younger courts.

The data also reveal a very strong relationship between the intercepts and the slopes of the diffuse support and specific support regressions ($r = -.74$): As the magnitude of the intercept increases, the slope decreases. These intercepts indicate the level of support for the high court when satisfaction with its performance is at its nadir. In some sense, then, these coefficients represent the depth of the reservoir of goodwill at its shallowest. As the reservoir fills, specific and diffuse support become more weakly connected, suggesting that the marginal benefit of satisfying more people declines. The larger the hardcore support, the more difficult it is for the court to enhance its supply of legitimacy within the mass public.

There is also a powerful relationship between the age of the institution and the degree to which awareness translates into satisfaction. As age increases, the connection between the salience of the institution and specific support increases ($r = .71$). For older courts, this suggests that becoming salient strongly enhances satisfaction. Since we have seen that increased satisfaction more readily translates into legitimacy among older courts, the stronger connection between salience and satisfaction means that salience is a strong but indirect contributor to institutional legitimacy (indeed, the correlation between court age and the rate at which awareness translates into diffuse support is .45).¹⁶

¹³ For the statistical analysis, we recoded the birth year of all the older courts to 1945. This not only eliminates statistical skewness but also recognizes the distinction between chronological and political age.

¹⁴ Hoekstra and Segal (1996) make a similar argument based on the aggregation of support across various local communities in the United States.

¹⁵ There is some curvilinearity in the relationship associated with skewness in the age of the courts. A simple quadratic equation results in explaining 12% of the variance.

¹⁶ We have investigated whether these findings are in part a function of the particular legal cultures represented in our sample of countries. Relying upon our earlier work on the legal cultures of the nations of the European Union (Gibson and Caldeira 1996), we discovered that legal culture is related to the age of the institution,

DISCUSSION AND CONCLUSION

With only twenty cases available for analysis, it is prudent not to push the statistical analysis much farther. We have already made some important discoveries, and we are full of ideas for additional research. Our principal findings are recapped below.

- Even within our fairly restricted sample, national high courts vary enormously in the degree to which they have achieved institutional legitimacy.
- The U.S. Supreme Court is not as unusual as typically depicted. Compared to European high courts, it is among the more salient and more legitimate institutions, but it is by no means *sui generis*.
- Generally, to be aware of a court is to be supportive of it. This positivity bias may be associated with exposure to the legitimizing symbols that all courts so assiduously promulgate.
- The acquisition of support is a dynamic process. Our data suggest that courts generate specific support by becoming salient, by making their policymaking activity known to the mass public.
- It appears that satisfaction slowly evolves into institutional legitimacy, and the degree of connection between specific and diffuse support is contingent upon the institution's age. At the micro level, this finding is compatible with the notion of a running tally; at the macro level, it suggests that young courts can only acquire legitimacy by making their decisions known to the mass public and waiting.
- It may not be necessary for a court to satisfy the majority of its constituents with any given decision. Courts may be able to build legitimacy by developing support among a succession of minorities. To the extent that a national high court appeals to and satisfies only a single constituency, it is unlikely to acquire legitimacy. But if different areas of policymaking please different constituents, then legitimacy is attainable through the cumulation of satisfied minorities.
- This strategy is possible due to the strong positivity bias in popular reaction to these courts. We argue that the bias may be a function of the ability of judges to frame issues in a light favorable to the maintenance of institutional legitimacy, thereby blunting the effect of unpopular decisions.
- Finally, though we found some cross-national variability, these empirical results are remarkably consistent across the countries sampled.

Yet, the data also give rise to some important puzzles that may require fundamental rethinking of the processes involved in acquiring and maintaining institutional legitimacy. For instance, as we have shown, satisfaction with court outputs and institutional legitimacy are closely connected among established courts but weakly connected among new ones. The age of a

court is more strongly related to the level of specific support than to institutional legitimacy. Conventional theory about the origins of legitimacy (e.g., Easton 1965) predicts that, with time, diffuse and specific support will become more divorced rather than more closely connected, since diffuse support is so little affected by short-term quibbles with the institution's performance. Our results require reconsideration of the relationship between these two forms of support.

Three possibilities occur to us. First, our measure of specific support may be systematically contaminated with traces of diffuse support. We neither asked respondents whether they approved of specific court decisions nor screened the question by awareness of specific decisions. Our measure is performance based, but it clearly asks the respondents for a summary judgment of how well the institution has been performing—to report something akin to a running tally of their feelings about the high court. Thus, our measure may come close to encroaching on diffuse support, or it may tap an orientation somewhere between diffuse and specific support.

Second, perhaps attitudes toward institutions are more complicated than we originally assumed. We have resisted making a distinction finer than that between specific and diffuse support, especially since we are mindful that not all scholars recognize the utility of differentiating these two attitudes in the first place. But perhaps many people hold one of three types of views toward institutions. (1) They may evaluate specific institutional outputs—after the fashion of presidential or ministerial popularity. Such attitudes are obviously highly fluid. (2) They may also develop a running tally, a summary of past satisfactions. This attitude is a judgment about how well the institution has been performing its job in general. (3) They may hold views about the institution itself. These we refer to as “institutional commitments,” or diffuse support. Thus, people evaluate the day-to-day outputs of institutions, summarizing those evaluations in a generalized sense of the quality of institutional performance. After enjoying sustained satisfaction, people develop commitments that transcend short-term, or perhaps even relatively mid-term, dissatisfaction with the outputs of the institution. Though the interrelationship among these three attitudes is assuredly complicated (and changes over time), we suspect that at least some people have differentiated views of institutions and the policies they produce.¹⁷

We would like to add one more heresy to this revised framework. Perhaps diffuse support is a cause and not a consequence of specific support, at least in political systems within which attitudes toward courts have crystallized. That is, the level of commitment to an institution may color the views one holds of its performance. Through processes of framing and selective

but no relationship in Figure 1 is seriously altered by adding legal culture as a control variable. Obviously, this does not greatly enhance our confidence in generalizing the findings from this analysis, but at least one obvious threat to their universality can be discounted.

¹⁷ Hibbing and Theiss-Morse (1995) are not reticent about breaking apart attitudes toward the U.S. Congress. They show that people have separable views toward (a) their own representative in the House, (b) members as a collective, and (c) the institution. Our proposal is not much more complicated than theirs.

perception, those with allegiance to a court may be likely to discount objectionable decisions and give excessive credit for favorable decisions. Part of this process may involve selective perception—one pays more attention to decisions with which one agrees. But another element may have to do with processes of assigning blame for bad decisions. Those with a strong commitment to a court are most likely to be those who have been continuously exposed to the legitimizing symbols propagated by courts (reinforcing the effects of preadult socialization), and thus they are likely to have an alternative explanation for a particular decision (or even a particular set of decisions)—for example, it was compelled by “the law” or “the Constitution.” If courts frame unpopular decisions to avoid responsibility for policy, then a positivity bias would result: Favored decisions would result in an increment in the running tally, but disfavored decisions would not result in decrements. This would also mean that diffuse support causes specific support by providing a framework for interpreting and evaluating the outputs of courts. If so, then the research agenda for the field needs a profound reorientation.

Much of our analysis is admittedly speculative. Though we have amassed the broadest collection of data ever assembled on mass attitudes toward national high courts, our findings are nonetheless limited to the United States and Europe. And our efforts to tease longitudinal processes out of cross-sectional data will surely not please everyone. Still, we are convinced of three things: Additional case studies of the U.S. Supreme Court (at least using conventional survey methods) can do little to advance our understanding of the processes by which courts acquire legitimacy; comparative politics must begin to include courts and law in its research agenda; and the worldwide trend toward the “judicialization of politics” provides enormous opportunity for using cross-national research on courts to test theories of institutional support heretofore thought untestable.

Attitudes toward Economic Reform in Mexico: The Role of Political Orientations

ROBERT R. KAUFMAN *Rutgers University*

LEO ZUCKERMANN *Columbia University*

Since the debt crisis of 1982, Mexico has experienced more than a decade of market-oriented economic reform, but research on public opinion toward reform is limited. Drawing on general findings from opinion research in the United States, this study examines how policy preferences of Mexicans are shaped by social background, judgments about the economy, and political loyalties. The effect of these variables is examined across three national surveys, conducted in 1992, 1994, and 1995. We found that favorable orientations toward the president and the ruling party were consistently the strongest predictors of preferences about reform. Furthermore, as in the United States, sociotropic evaluations of the economy outweigh "pocketbook" concerns; despite many years of reform, both expectations and retrospective judgments are important in shaping preferences, particularly since the 1994 crisis; and social background variables have limited direct influence.

Since the debt crisis of 1982, Mexico has experienced a series of stabilization efforts, trade liberalization, privatization, and other market-oriented reforms, but economic performance has fluctuated markedly.¹ In the early 1990s, after a long recession, the reforms appeared to be leading toward a significant recovery. In 1995, however, the economy again turned sharply downward as a consequence of the peso crisis and the uncertainties stemming from the 1994 presidential transition. This study examines public opinion about economic reform within this changing macroeconomic and political context, drawing on data from national opinion surveys conducted in 1992, 1994, and 1995.

The analysis focuses primarily on the extent to which opinions about reform are influenced by orientations toward the president and the ruling party, which for almost seven decades have been the core institutions of the Mexican political regime. How important were these orientations, as distinguished from judgments about the effect of the reforms on personal well-being or on overall performance of the economy? To what extent did political loyalties continue to shape opinion during the severe crisis of 1995, a period in which virtually all Mexican households experienced a sharp decline in their economic situation?

Two other issues discussed in the survey research literature also receive attention. One is the extent to which policy preferences are influenced by "sociotropic" judgments about their effect on collective well-

being. This question has been discussed extensively in studies of public opinion in the United States (Kiewiet 1983; Kiewiet and Rivers 1984; Kinder 1981; Kinder and Kiewiet 1979, 1981; Kinder and Mebane 1983; Lau and Sears 1981; Rosentone, Hansen, and Kinder 1986). It is also relevant to countries in which market-oriented adjustments improve economic performance but have limited or negative effects on the distribution of income. The second issue highly relevant to the politics of reform is the extent to which the public may be willing to accept short-term sacrifices in the expectation of future benefits. The acceptance of such tradeoffs has been recently explored in works on Peru (Stokes 1996), Poland (Przeworski 1996), and Mexico (Buendia 1996).

Our main concern, however, is how such judgments are mediated by orientations toward the president and the ruling party. The weight of political mediations in the formation of policy preferences is a function of both the salience of the issue to the individual and the costs of acquiring information about it. Stabilization and structural adjustment initiatives are highly salient to most Mexicans, and we expect that they will be inclined to evaluate directly the way such measures are likely to affect their economic well-being. But it is costly to acquire information about distributive consequences, sustainable alternatives, and future prospects. Political cues and loyalties can be important for reducing those costs (Popkin 1994).

In Mexico, both the president and the ruling party (Partido Revolucionario Institucional, or PRI) have been major focal points of political loyalties throughout most of the twentieth century. Presidents traditionally have towered over the political landscape, exercising extensive powers during their six-year term. As heads of state and of the ruling party, they controlled access to all major bureaucratic and elective offices, dominated the policymaking process, and named their successor. They have also exercised significant influence over public opinion, both through the quasimonopolistic and preregime television networks and through private newspapers that depend on the government for advertising and newsprint. In response to

Robert R. Kaufman is Professor of Political Science, Rutgers University, New Brunswick, NJ 08903, and Leo Zuckermann is a doctoral candidate, Department of Political Science, Columbia University, New York, NY 10027.

The authors are very grateful to the following people for their criticisms and advice in the preparation of this manuscript: Ulises Beltrán, Jorge Buendia, Bruce Chadwick, Blanca Elena del Pozo, Richard Lau, Oscar Torres, and especially Jane Junn and Robert Shapiro. Research was financed by the Institute of Latin American and Iberian Studies of Columbia University with a grant from the Hewlett Foundation. The Center for International Business Education of Columbia University provided additional funds.

¹ For discussions of the economics of this period, see Lustig (1992) and Bazdresch (1993).

the 1982 debt crisis, presidents De la Madrid, Salinas, and Zedillo deployed their powers to push through wide-ranging stabilization and adjustment initiatives, and Salinas in particular used his extensive influence over the mass media to cultivate public support (Beltrán and Moreno 1996; Centeno 1994).

The PRI has been a much more reluctant partner in this process. Its main support historically has come from social sectors with a major stake in government patronage and protection, and important factions have resisted change in the policy status quo. Nevertheless, until at least the mid-1990s, the PRI remained a pivotal instrument through which reform-oriented presidents controlled opposition and gained electoral legitimation. Although the party's electoral hegemony declined markedly during the 1980s and the 1990s, a large percentage of voters continued to support PRI candidates. Their support arguably stemmed from a mixture of motives—habit, clientelistic ties, or perhaps aversion to the risks of political change. Nevertheless, many PRI loyalists may be expected to accept reform simply because it is associated with the ruling party.

A number of surveys in Mexico provide useful insights into the bases of support for the president and ruling party. These studies found that one factor is generalized judgments about the stability of the dominant-party regime and the viability of the political alternatives, rather than specific policy preferences or ideological orientations (see Davis and Coleman 1994, 358; Dominguez and McCann 1995, 1996). Davis and Langley (1995) suggest that as Mexico grows more competitive electorally, party identification may become increasingly important in evaluations of presidential performance. These findings are generally consistent with our arguments regarding political mediations.

We are concerned, however, with explaining issue preferences rather than political choice. We want to understand the sources of individual attitudes toward market reform, in particular, how they are formed, and how they relate to other characteristics and beliefs of individuals. In raising these questions, we address assumptions common in influential works on the politics of economic reform (e.g., Frieden 1991; Haggard and Webb 1994; Przeworski 1991). These attach considerable importance to socioeconomic background, distributive interests, and judgments about economic conditions, but they generally pay less attention to the role of political mediations.

Orientations toward the president and the PRI, of course, can be expected to affect policy preferences in combination with these other influences. As we shall discuss below, the interaction among such factors is likely to be quite complex. The underlying principle of our analysis, however, is relatively simple: The direction of causality goes from sociodemographic background, to judgments about the economy and political loyalties, to preferences about reform.

The article is organized into six sections. The first provides a description of the data. The second discusses the measurement of opinions about reform—the dependent variable. The third shows the bivariate

associations with variables related to social background, economic judgments, and political loyalties. The fourth and fifth provide a multivariate analysis and a more complex causal model of opinion formation based on these findings. Finally, there is a brief conclusion.

THE SURVEYS

The three national surveys on which this study is based were organized by the Mexican Office of the Presidency. Questionnaires were designed within the office; the survey was conducted by Opinion Profesional S.A. de C.V., a private company specializing in policy polling and focus groups. Field workers were not informed of the client's identity; they identified themselves to respondents only as employees of Opinion Profesional. Because it was expected that many respondents would be reluctant to express their voting intentions and political preferences, a simulated secret ballot procedure was employed for these questions. Respondents were asked to mark their preference on a sheet of paper, seal it, and place it in a box.

The surveys in September 1992 and November 1994 contained 4,960 and 4,998 household interviews, respectively; in March 1995, there were 2,816 household interviews.² Households were located for interviews through a multistage, stratified probability sampling procedure. At each household, an interview of about 45–60 minutes was conducted with one respondent, selected at random, with about an equal proportion of men and women. The response rate is estimated at 75%; interviews were obtained in three of every four households contacted. For each survey, the margin of error attributable to sampling error was estimated at $\pm 2\%$. Further details on sampling and questions are provided in appendices A and B.

Government-sponsored surveys can sometimes be criticized for loading questions in ways that elicit responses favorable to the political objectives of the president. In these surveys, however, respondents were offered explicit “pro and con” choices on most issues, including the performance of the president, electoral preferences, general support for the government's economic program, and opinions on seven of the ten policy items used in our analysis (see the appendices for precise wording of each item). Exceptions were the items on NAFTA and bank privatization in the 1992 survey and the question on the stabilization pact in 1994, which asked respondents only if they “approved.” The potential affirmative biases contained in such wordings, however, are more likely to constitute a problem for estimates of aggregate distributions of opinion than for analyses of the association among variables. The risks, moreover, are reduced still further by the use of multiple measures of the dependent variable, which produce similar results.

² Since 1995, the data from these surveys have been available to scholars at the Roper Center in Connecticut and at the Centro de Investigacion y Docencia Economica in Mexico.

TABLE 1. Association between General Support and Policy Index and Specific Policies

	1992	1994	1995
1. Correlation analysis (Pearson's <i>r</i>)			
General Support with			
Policy index	0.34	0.41	0.59
Agreement with NAFTA	0.37	0.33	—
Bank privatization	0.31	0.33	—
Approval of wage-price pacts	—	0.42	—
Agreement with foreign investment	—	0.27	—
Agreement with inflation control	—	—	0.43
Approval of wage-price inflation control	—	—	0.31
Agreement with stabilization program	—	—	0.58

Note: Coefficients are significant at the $p < .001$ level. Values not available are marked with a dash (—).

MEASURING OPINIONS ABOUT ECONOMIC REFORM

Two different measures of opinions about reform were used, each with some distinct advantages and disadvantages. One was *General Support*, based on a question that asked respondents to evaluate the "economic measures" taken by the government. Respondents who viewed those measures as "adequate for resolving the economic situation" were regarded as strong supporters of reform; those who thought only "some" measures were adequate were considered moderate supporters; those who answered "inadequate" were labelled opponents. The same general support item was included in all three surveys and is thus especially useful for gauging changes in opinion over time.

The other measure was an additive *Policy Index*, based on responses to questions about more specific stabilization and structural adjustment policies that were major components of the government's market-oriented strategy: NAFTA, privatization, foreign investment, and wage-price agreements (see Appendix A for precise questions and coding process). The policy items used for the index differed across the surveys, making the indexes less useful than the general support measure for comparisons over time. Yet, the specific policy content of the indexes provides confidence that responses do not simply reflect more general political predispositions.

Table 1 shows that opinions about specific policies were consistently associated with support/opposition for the general policy measures taken by the government. This provides a good indication that both sets of measures are valid—that they tap actual opinions about salient issues of economic reform. The 1992 respondents who agreed with the general economic policies of the government also tended to support NAFTA and, to a somewhat lesser extent, the privatization of banks. In 1994, general support was closely

associated with foreign investment and the antiinflation program. In 1995, those who favored the government's overall economic management were also inclined to support the stabilization program announced by President Zedillo, to express faith in pacted wage-price agreements, and to express confidence that the program would contain inflation.³

Before analyzing these preferences at the individual level, it is important to consider briefly the broader political and economic context in which the surveys were conducted and how aggregate opinion toward reform changed over time. The 1992 survey was conducted during the third consecutive year of recovery from almost a decade of economic stagnation and price instability (Banco de México 1993), and general support was predictably high: 57% wholly approved of government policies, 33% approved in part, and only 10% opposed.

During the next two years, the situation was less promising. In 1993 the growth rate flattened, and in 1994, the year of the next national survey, the turbulent process of presidential succession entered into full swing. Strong and moderate supporters fell to 44% and 38%, respectively, while opponents rose to 18%. By the March 1995 survey, the peso crisis had occurred, and the Mexican economy was entering its third month of resurgent inflation, recession, and growing political uncertainty. Almost half the population (47%) expressed disagreement with the reforms, while strong and moderate support dropped to 31% and 22%, respectively.

This sharp decline in support is consistent with Jorge Buendia's (1996) finding that evaluations of reform in Mexico are based on retrospective judgments about economic performance rather than on expectations of improvement. Surveys conducted in Peru (Stokes 1996) and Poland (Przeworski 1991, 1996) indicate that people in those countries are willing to accept "temporary" hardships during the early phases of reform in the expectation of long-term benefits. After so many years of adjustment in Mexico, it is not surprising that people have begun to respond to economic fluctuations in a manner more typical of "normal" market economies.

A somewhat different puzzle is posed by the fact that, despite deteriorating economic conditions and growing public dissatisfaction, a large sector of the population (53%) continues to express complete or partial agreement with government policies. This raises the question of how opinion is distributed among different population sectors. Are some groups more likely than others to support or oppose reform, and

³ An additional check on the coherence of the policy index was provided by a principal-component factor analyses of the individual items. In each year, this yielded only a single factor with an eigenvalue greater than 1.0. Factor loadings for all but one of the individual items ranged from more than 0.6 to more than 0.8. The lowest loading was .58, for approval of the wage-price pact in 1994. Principal-component analyses which included both general support and policy items produced similar results. For each year, the analysis produced a single factor, with individual loadings ranging from .65 to .78 in 1992, .58 to .75 in 1994, and .54 to .82 in 1995. For reasons discussed in the text, however, we analyze the policy index and general support measures separately.

what factors influence their opinions? In the following sections, we address this question with individual-level data from the three surveys.

SUPPORT FOR REFORM: BIVARIATE RELATIONSHIPS

We begin by examining the bivariate associations between attitudes toward reform and the three sets of independent variables mentioned in the introduction: sociodemographic background, judgments about current and future economic performance, and political attachments to leaders and parties. From what we know generally about the effects of economic reform across socioeconomic groups and geographic regions (Lustig 1994; Morely 1994), we can hypothesize that several demographic variables may reflect respondents' "objective" interests with respect to reform. Public sector employees may be more inclined to opposition than those in the private sector, since the former are more threatened by privatization and the downsizing of the state. Support for reform may also be relatively low among residents of greater Mexico City. The urbanized and relatively cosmopolitan capital and its surrounding territories have long been an important center of opposition to the ruling PRI and the established authority of the regime (Beltrán and Moreno 1996). In addition, this region contains a high concentration of import-substituting firms and government workers.

The possible influence of income, education, and gender is much more ambiguous, but we can suggest a number of ways in which they may affect opinion about reform. Wealthier groups would be in the best position to tolerate the risks associated with large-scale transformation.⁴ Education would increase access to information about actual and potential policy effects. In Eastern Europe, there is some evidence that people with more schooling expect to benefit from reforms and therefore are more inclined to support them (Evans 1995). In Mexico, however, prolonged efforts at economic adjustment have yielded mediocre or poor results, so people with more education may be skeptical about the government claims. Finally, reforms have opened up new employment opportunities for women, especially in the *maquiladora* (export-processing) sector of the economy. Despite their low wages and poor working conditions, they may be more inclined than men to favor reforms.

The surveys also asked for judgments about economic conditions. Respondents were asked to evaluate both their personal economic situation and that of the country—indicators of "pocketbook" and more "collective" concerns. Another set of questions measured intertemporal judgments—whether they expected their personal situation to improve in the future.⁵ The 1995

survey included an item on fear of unemployment. We examined these responses, because such fears have been shown to be a very important source of opposition to reform in Eastern Europe (Przeworski 1993, 1996) and Peru (Stokes 1996) as well as Mexico (Buendia 1996).

For reasons discussed above, support for reform also can be expected to be associated with favorable orientations toward the president and the PRI. The direction of causality, to be sure, can be questioned; policy preferences can determine as well as reflect political attachments, and it is beyond the scope of this article to model the potential two-way effects. In this instance, however, government policies on stabilization and market-oriented reforms challenged principles of state-led development long supported by virtually all sectors of Mexican society. Thus, it is plausible to assume that Mexican presidents and their allies within the ruling party have led rather than followed public opinion on policy (Aguilar Camín 1989).

These impressions are supported by findings in other studies of Mexican public opinion. In surveys conducted in 1988 and 1991, Dominguez and McCann (1995, 1996, 9) found that in initial decisions to support the PRI or the opposition, views on policy issues were "only marginally related to voter intentions." Davis and Coleman (1994, 358) argue similarly that voters' "overall impression of the performance of the Salinas administration drives their views about performance in more specific policy areas." The widespread popularity enjoyed by President Salinas during his term thus seems far more plausibly attributable to his mastery of public relations, or perhaps to the prestige of the presidency itself, rather than to his privatization and trade policies.

As indicators of orientation toward the president and the PRI, we relied on responses to two items. The first asked whether respondents agreed or disagreed with the way the incumbent president (Salinas or Zedillo) was "handling his job." The second asked respondents to indicate their preferences among the major contenders in the most recent presidential election, each of whom was explicitly identified as a candidate of the PRI, the Partido Acción Nacional (PAN), or the Partido de la Revolución Democrática (PRD). Unfortunately, more direct questions about party identification were not included in any of the three surveys, and we do not claim that the item we use is a fully valid proxy. Nevertheless, the question introduces party into the respondent's frame of reference, and the answers can be presumed to provide a reasonable indication of partisan orientation.⁶

Bivariate relationships are shown in tables 2 and 3. Table 2 reveals how general support for the economic program is distributed among subgroups of the sample.

⁴ It is also possible, however, that the very poor would be less inclined to oppose reform than the lower middle class, which historically has been highly dependent on public employment and services (Nelson 1992).

⁵ In 1994 and 1995, this question did not make explicit reference to economic well-being, but it is reasonably safe to assume that the item measured *economic* expectations. Evidence from focus groups

showed that economic well-being was the dominant issue in discussions of personal concerns.

⁶ Preelection polls show strong correlations (between .7 and .8) between responses to the standard question on party identification and the items used in this study. There is a strong association between party identification and presidential vote (Mercado Gasca 1997, 316).

Note: Values are Pearson Rs, significant at the * $p < .05$; ** $p < .01$; *** $p < .001$ levels. The number in parentheses refers to valid cases in each bivariate association. The unemployment question was not asked in 1992 and 1994.

Table 3 shows the strength of the associations between the independent variables and the two measures of attitudes toward reform. Both general support and the policy indexes are strongly and consistently linked to economic perceptions and political orientation, but the associations with the demographic variables are far weaker.

Among the demographic variables, region is most strongly associated with preferences about reform. In both tables 2 and 3, residents of Mexico City are generally less likely to express favorable opinions than those in other regions of the country. As already suggested, this may reflect the effect of economic liberalization on the import-substituting economy of central Mexico or relatively more skepticism toward the government.

The relationship between opinions about reform and the other demographic variables is weak or inconsistent. Table 3, for example, shows that respondents with higher incomes and those who worked in the private sector were more likely to express favorable opinions in 1992 and 1994, but in 1995 these associations disappeared or went in the opposite direction. The association with education is positive in some cases and negative in others, and gender differences are insignificant across the three surveys.

One possible explanation for these findings may lie in the weakness of Mexico's civil society; interest associations were generally dependent on the government or ruling party and were not strongly inclined to articulate and contest the distributive implications of

reform. It is also possible that sociodemographic background influences preferences indirectly, through effects on economic perceptions and political loyalties. This point is addressed in the causal models presented below.

In contrast to the sociodemographic variables, perceptions of economic well-being are closely linked to support for reform. The only surprise—and it is a very mild one—concerns fear of unemployment. This variable correlates significantly with both general support and the policy index; but a somewhat stronger association could have been expected, given the importance attached to fear of unemployment in the comparative literature. A possible explanation is that the substantial layoffs following Zedillo's stabilization initiative did not begin until after the March 1995 survey, and earlier Mexican reforms were not accompanied by very high rates of unemployment, unlike the situation in either Poland or Peru.

On the whole, however, preferences about reform are strongly associated with evaluations of the economy. People who judge the economy favorably are very likely to back both the overall government program and the specific policies. This holds for both retrospective and prospective judgments, for "sociotropic" and "pocketbook" concerns, and for fear of unemployment.

The multivariate analysis will provide a fuller discussion of the relative importance of these different types of judgment. It should be noted, however, that during the 1995 crisis, people expressing hope for the future made a much larger contribution to overall support for

reform than did the tiny minority of Mexicans who judged the current situation favorably. "Optimists" in 1995 constituted 17.6% of the total sample but more than 30% of those who supported the government's economic program.

Finally, there is a strong and consistent association between political orientation and support for reform, a pattern which persists through the 1995 crisis. Despite the severe economic deterioration, a large group of respondents expressed support for the president (47%) and the party (40%). Furthermore, the reform program of the government received approval from about half of these political loyalists (47% in the presidential group and 50.8% in the PRI group), compared to only 31% for the total sample.

Of course, the relatively strong support for the government's program among presidential and PRI backers could stem from their inclination to affirm their political loyalties rather than from their policy preferences. If that were true, then the distributions shown in Table 2 would simply reflect an autological relation between independent and dependent variables. For reasons discussed above, however, the policy indexes are less vulnerable to this criticism, and Table 3 shows a strong association between these indexes and political orientation. In most cases, in fact, it equals or exceeds the strength of association between the policy indexes and judgments about the economy.

SUPPORT FOR REFORM: MULTIVARIATE ANALYSIS

The central question raised by the bivariate associations is the extent to which political orientation plays an independent role in shaping opinion and the extent to which it simply reflects economic well-being. The collapse of the economy clearly undermined support for the president and the PRI candidates in 1995. Does this mean that loyalist respondents are backing the reform because of their positive views of the economy, or does political orientation have an effect that is not simply a reflection of economic perceptions?

These questions were examined through regressions of the measures of support against the independent variables discussed in the preceding section. The generic model is as follows:

$$\begin{aligned} \text{SUPPORT or POLICY INDEX} = & \text{Constant} + b_1 \\ & \text{Economy} + b_2 \text{ Personal} + b_3 \text{ Expectations} + b_4 \\ & \text{President} + b_5 \text{ Party} + b_6 \text{ Income} + b_7 \text{ Education} + b_8 \\ & \text{Mexcity} + b_9 \text{ Gender} + b_{10} \text{ Sector} + \text{Error}, \end{aligned}$$

where:

SUPPORT = general support for reform;
POLICY INDEX = policy index;
Economy = perception of country's economic situation;
Personal = perception of personal economic situation;
Expectations = personal expectations;
President = approval of president;
Party = political-electoral sympathies;
Income = income;
Education = education;

MexCity = Mexico City;
Gender = gender; and
Sector = public or private employment.

Tables 4 and 5 show the ordinary least squares (OLS) estimates of these models.⁷ Taken together, the demographic, perceptual, and political orientation variables explain a substantial percentage of the variation in both the policy index and general support for reform. Adjusted R^2 in the two sets of regressions ranges between .34 and .27 for general support and between .21 and .26 for the policy index.

The weights of the individual variables within each equation—as indicated by the standardized betas—are also quite consistent across the surveys and correspond closely with what we found in the bivariate statistics. Both models are thus robust across time. Although residence in Mexico City had some effect on general support in 1992 and 1994, the demographic variables are generally among the weakest predictors of reform preferences. Gender crosses significance thresholds in the estimates of the 1994 and 1995 political index, but its contribution is limited, and contrary to our hypotheses, women are somewhat less likely than men to have favorable opinions about reform. As in the bivariate statistics, the strongest contributions come from judgments about economic conditions and political orientation.

Looking more closely at the way perceptions of well-being affect support for reform, two points can be noted. First, as in the United States, views of general economic conditions are consistently stronger predictors of support for reform than are perceptions of personal well-being. Standardized betas for the former are significant and relatively high in all six regressions, whereas personal well-being is significant only for the 1994 estimate of the policy index.

The second point of interest is the strength and consistency of expectations as a predictor of support for reform. In 1992 and 1994, this variable made substantial contributions to both general support and the policy index. During the crisis year 1995, as judgments about the economy turned uniformly negative, the standardized betas for expectations were surpassed only by the variables measuring political orientation. The importance of expectations indicates the need to modify somewhat the conclusions drawn at the aggregate level about retrospective judgments (Buendia 1996). These did contribute to a broad decline in backing for reform, but respondents continued to differ in their judgments about future prospects. As just noted, this helped to account for the persistence of support for government policy during 1995.

Finally, the multivariate models show quite strong support for our hypothesis about political mediations.

⁷ In the case of SUPPORT, an ordinal measure, we used ordered probit regressions as well as OLS statistics. The ordered probit estimates are more suitable for the analysis of ordinal data. The results are very consistent with those obtained through OLS regressions. We present the OLS findings in order to facilitate comparisons with the policy index.

Note: Standard errors are in parentheses. * $p < .05$; ** $p < .01$; *** $p < .001$. The fear of unemployment question was only asked in 1995.

Even after controlling for perceptions of economic well-being and sociodemographic variables, positive assessments of the president and of PRI electoral candidates were consistently among the strongest predictors of support for reform. In both 1992 and 1994, a respondent's orientation toward the president was the best single predictor of general support and preferences on the policy index, and partisan preferences also made a substantial contribution relative to other variables in the model.

Political orientation continued to make the strongest contribution in the 1995 regressions. Unlike 1992 and 1994, however, the preference for PRI candidates tended to be a somewhat stronger predictor than was approval of the president. In all the estimates, moreover, there was an increase over time in the b coefficients of the partisanship variable. This pattern may reflect in part the contrast between the flamboyant Salinas and the more tentative style of Zedillo. Or, as Davis and Langley (1995) suggest, it may reflect the growing importance of partisan cues for making economic judgments, as Mexican party politics becomes more competitive. In either event, despite deep internal divisions among PRI activists, the party remained an important mechanism for building public consent (or at least acquiescence) to reform policies.

CAUSAL MODELS

The estimates in our multivariate analyses show the extent to which political orientation, economic perceptions, and demographic variables affect support for reform but not how they combine to do so. In this section, we model possible paths through which these variables influence opinion, building on the results shown above. The hypothesized causal relations and the path coefficients for 1994 are displayed in Figure 1. To simplify the presentation, we do not show the coefficients for 1992 and 1995, but these parallel closely the findings for 1994, and we indicate in the text the points at which they diverge.⁸

The sociodemographic variables in the model are region and income, both of which had at least a modest effect on support in our earlier analysis. Numerous studies have suggested that opposition to the regime is strongest in metropolitan areas (Mercado Gasca and Zuckermann 1994), and on the basis of this literature, we posit that region influences preferences about reform through its effects on political orientation. In-

⁸ To illustrate our broader findings, path coefficients from 1994 were selected because that year was closest to "normal" in terms of the economic recovery and support for the president. In contrast, 1992 marked a high point, and 1995 was a year of profound crisis.

come, we suggest, affects policy preferences through a different path: Wealthier individuals may be expected to have more positive views of the economy and more positive expectations about the future, which in turn would encourage positive views of reform.

Specification of the sociodemographic antecedents of policy preferences are of less concern in this paper than are economic perceptions and political orientation. Nevertheless, the two factors that we highlight are not implausible points of departure for the analysis. Income and region consistently and significantly affect economic judgments, political orientation, and expectations in the directions hypothesized. The direct effects of both income and Mexico City on attitudes toward reform in 1994 are stronger than we expected, but they are still weak relative to the other factors presumed to have the most direct influence, and they disappear entirely in the specifications of the model for 1992 and 1995.

The most proximate influences on policy preferences come from three sets of variables: judgments about the economy, orientation toward the president and the PRI candidates, and expectations about future improvement. Yet, these perceptions affect one another, and support for reform, in several different ways.

Judgments about economic performance can have both a direct and an indirect (or mediated) effect on popular assessment of economic reforms. Given Mex-

ico's long experience with adjustment, people can be expected to judge reforms in terms of how they think the economy is doing, regardless of their political orientation. Yet, judgments about economic performance also have an important effect on support for the president and the ruling party. People who feel positively about them are more likely to have faith in their policies, even if they are not sure how such policies have affected economic outcomes.

Our models allow us to disaggregate the total non-spurious effects of economic judgment on policy preferences and to compare the relative contributions made by the direct path and by paths passing through support for the president and the PRI. As expected, the direct path from economic judgment does indeed make a strong contribution to the policy index and general support—about 50% of the total nonspurious effects in 1994. But the paths leading through support for the president and the PRI also make important contributions to the nonspurious effects of economic judgments—about 33% of the effect on the policy index and about 36% on general support. In the other two years as well, about one-third of the effects of economic judgments on policy preferences passed through political orientation.

Expectations play a somewhat different role in our model. We suggest that they will affect policy preferences relatively directly but will be shaped by a number

FIGURE 1. Causal Model for Policy Index/Support, 1994

of different influences. One path to expectations goes through judgment about economic performance; people who think things are going well are more likely to feel their own situation will improve over time. Expectations also may be shaped by political orientation. People who support the president or party in power are also inclined to trust them to bring a brighter future. These positive expectations, in turn, would lead to support for policy reforms. The path coefficients in Figure 1 show that judgment about the economy has the strongest single influence on expectations (.22) but is outweighed by the combined effect of support for the president (.12) and the PRI (.16). Expectations, finally, are consistently and fairly strongly related to support for reform in all years and all specifications of the model.

Finally, our model posits a number of different mechanisms through which positive views about the president and the ruling party can lead to support for reform. One, just discussed, is through shaping expectations about improvement in economic well-being. Other and more direct paths may reflect the way respondents evaluate the competence of the incum-

bents relative to opponents. People who support the economic policies of the regime do so because they believe it can produce better results than its challengers.

Our path analysis shows that the direct effect of presidential support outweighs both judgments about the economy and expectations; a finding that is generally true for 1992 and 1995 as well.⁹ The effect of political orientation on policy preferences, it may be noted, is strongest relative to perceptions about the economy in 1995; in that year, the path coefficient leading from support for the president to the policy index reached .36, the highest in any of the estimates. At a time of economic crisis, people may support the policies of the regime not because of retrospective judgments or hopes for the future but because they perceive a lack of political alternatives.

⁹ The single exception is for the 1992 policy index, in which the coefficient for economic judgment is .21 and that for the president is .19.

CONCLUSION

In all countries undergoing economic adjustment, public support is potentially an important factor in sustaining reforms. Survey research on the sources of support is still at a relatively early phase, and there is much to be learned. One conclusion is suggested rather clearly, however, both by existing theory and our own findings: Immediate "pocketbook" concerns are neither the only nor the most important basis on which people evaluate policy. Both socioeconomic interests and "subjective" perceptions of well-being may influence the formation of policy preferences, but this influence depends on how people link their personal situation to broader patterns of economic performance, prospects for the future, and the government in power. In these respects, Popkin's (1994, 31) characterization of American voters appears to apply to Mexicans as well: They "are not self-centered and reflexive in evaluating their leaders and making voting choices. Their evaluations and voting decisions depend on whether their reasoning connects their situations to the national situation and to the actions of their leaders."

When people give precedence to "national conditions" over "pocketbook concerns," they are not necessarily motivated by altruism; they may believe that reform will have a stronger effect on overall economic performance than on their own personal condition. Individual economic interests, to be sure, may influence the way people view the economy—a point we have suggested in our causal model. As in the United States, however, judgments about the economy as a whole are likely to have the most direct effect on the way people evaluate reform (Fiorina 1981, 90; Kinder, Adams, and Gronke 1989, 511; Lau and Sears 1981).

Although preferences for reform are influenced by judgments about how it will affect the future, we must qualify our findings about the role of expectations in several ways. Expectations may be less important in Mexico than in countries where adjustment initiatives are more recent. The sharp rise in the percentage of Mexicans opposing reform since the crisis of 1995 indicates increasing disillusionment with promises of the future prosperity; they are understandably inclined to judge reform in terms of the existing economic record. Yet, given the extraordinary hardships most Mexicans have endured since 1995, it is somewhat surprising that support for reform has remained so strong. While this may partially reflect a belief that there are no better alternatives, our data suggest that hopes for improvement continue to play an important part.

The most striking finding to emerge from our analysis concerns the role of political orientation in shaping policy preferences. Its importance is well documented in the American setting; in situations of high uncertainty and limited information, political cues and group loyalties can provide crucial short-cuts in the evaluation of both candidates and policies (Popkin 1994). In most countries undergoing economic adjustment, the quantitative effect of these mechanisms has not been analyzed, but impressionistic evidence suggests that

they are important. Spanish workers were more inclined to accept painful market reforms in the 1980s, for example, because they were undertaken by the Socialist Party (Bermeo and Garcia-Duran 1994, 112–6; Haggard and Webb 1994, 16–8). In countries such as Peru and Argentina, policies pursued under Fujimori and Menem gained broad acceptance in part because they were backed by presidents who appeared to be "in charge" (Haggard and Kaufman 1995, 198–202). Our data from Mexico show a comparable effect, notwithstanding the long-term erosion of the regime's legitimacy. During his term, Salinas successfully used his authority and control of the PRI to build personal prestige and sell his reform program. People who were positively inclined toward the president and the PRI tended to support reform regardless of their views of the economy.

After Salinas, the "imperial" presidency declined, due to economic crisis and Zedillo's different style of political leadership. In his effort to respond to the crisis, however, Zedillo can still draw on considerable political capital. Acceptance of his program is still substantial, and a large segment of the population continues to approve of the president and to support the PRI.

In few societies are political loyalties unconditional; they are continuously subject to reevaluation as circumstances change and new information becomes available. Our path analysis indicates that while approval of the president and the ruling party provides a guide for determining policy preferences in Mexico, it is strongly influenced by evaluations of economic well-being. The president is, in effect, a salesman who must persuade the public that he can bring a brighter future, and his success depends to a significant extent on what has been delivered in the past.

During the mid-1990s, the evident failure to deliver on promises has had two important implications for the capacity of the president and the PRI to mediate preferences about reform. First and most directly, support for the regime has weakened, and belief in the capacity of its leadership to resolve the problems facing Mexican society has diminished. Put somewhat differently, the "new information" coming from the collapse of the economy is undermining the political predispositions that underlay beliefs about reform (Zaller 1992).

Second, the crisis has accelerated the trend toward a more competitive electoral system, which fundamentally alters the political context in which Mexican public opinion is formed. On the center-left, the PRD has appealed to voters dissatisfied with the government's market-oriented reforms. On the right, although PAN leaders tend to share the policy views of the president, support for reform is lower among their followers than among the backers of the PRI (refer to Table 2).

Over time, increasing multiparty competition in Mexico is likely to expose that society to a wider debate about alternative solutions to current economic dilemmas, and opposition parties will have a stronger role in shaping perceptions (Davis and Langley 1995). It remains to be seen whether the result will be an unsus-

tainable backlash against the reforms or more constructive forms of political learning. Either way, Mexicans are likely to be presented with new ways to interpret the experiences derived from the economic crisis, and as never before, they will have opportunities to act on their opinions within the electoral arena.

APPENDIX A: DEPENDENT VARIABLES

GENERAL SUPPORT: Agreement with Economic Reform

[1992:Q24; 1994:Q31; 1995:Q28]

¿Cree usted que las medidas económicas tomadas por el gobierno son adecuadas o inadecuadas para resolver la situación económica del país? (1) Adecuadas (2) Algunas adecuadas (3) Inadecuadas

Do you think that the economic measures taken by the government are adequate or inadequate for resolving the country's economic problems? (1) Adequate (2) Some adequate (3) Inadequate

Support for Economic Reform	1992	1994	1995
Adequate	57.4%	43.8%	30.7%
Some adequate	33.2	37.9	22.2
Inadequate	9.4	18.3	47.1
Total valid responses	4,477	4,694	2,492
Don't know/No response	483	304	324
N	4,960	4,998	2,816

POLICY INDEX: Policy Index Composed of Several Components

1992 Components

Agreement with NAFTA [1992:Q4C]

¿Está usted de acuerdo con que se haya terminado la negociación de un tratado de libre comercio con los Estados Unidos y Canadá? (1) Si (2) No

Do you agree with what has been concluded in the free trade treaty with the United States and Canada? (1) Yes (2) No

Agreement with Privatization of Banks [1992:Q4A]

¿Está usted de acuerdo con que se hayan privatizado casi la totalidad de los bancos? (1) Si (2) No

Are you in favor with the privatization of almost all of the banks? (1) Yes (2) No

1992 Responses Components	NAFTA	Bank Privatization
Yes, agree	76.1	74.5%
No, disagree	23.9	25.5
Total valid responses	4,021	3,644
Don't know/No response	939	1,316
N	4,960	4,960

1994 Components

Agreement with NAFTA [1994:Q20]

Como usted sabe, desde enero de este año empezó a funcionar el Tratado de Libre Comercio con Estados Unidos y Canadá. ¿Está usted a favor o en contra de este tratado? (1) A favor (2) Da igual (3) En contra

As you know, the free trade treaty with the United States and Canada began to function in January of this year. Are you in favor or against this treaty? (1) In favor (2) Neutral (3) Against

Agreement with Privatization of Banks [1994:Q28A]

Dígame si usted está de acuerdo o en desacuerdo con las siguientes medidas realizadas por el gobierno este sexenio: Venta de bancos y de Teléfonos de México a empresarios privados. (1) Acuerdo (2) Acuerdo en parte (3) Desacuerdo

Tell me if you agree or disagree with the following steps taken by the government this presidential term: Sale of the banks and Teléfonos de México to private entrepreneurs. (1) Agree (2) Agree in part (3) Disagree

Perception that PECE (wage-price pact) is Controlling Inflation [1994:Q33]

¿Cree usted que el Pacto está ayudando a controlar la inflación? (1) Si (2) No

Do you believe that the Pact is helping to control inflation? (1) Yes (2) No

Agreement with Foreign Investment [1994:Q28C]

Dígame si usted está de acuerdo o en desacuerdo con las siguientes medidas realizadas por el gobierno este sexenio: Mayor entrada de empresas extranjeras. (1) Acuerdo (2) Acuerdo en parte (3) Desacuerdo

Tell me if you agree or disagree with the following measures taken by the government this presidential term: More access for foreign enterprises. (1) Agree (2) Agree in part (3) Disagree

1994 Responses Components	NAFTA	Privatization	Inflation Pacts	Foreign Invest.
Yes, agree	54.5%	39.3%	70.7%	42.4%
Neutral/agree in part	21.9%	18.5%	—	25.6%
No, disagree	23.6%	42.2%	29.3%	31.9%
Total valid responses	4,498	4,481	4,384	4,656
Don't know/No response	500	517	614	342
N	4,998	4,998	4,998	4,998

1995 Components

Agreement with Inflation Control [1995:Q21]

El gobierno afirma que con las medidas para enfrentar la emergencia económica se logrará evitar que la inflación se desboque, es decir, que se salga de control. ¿Usted cree que esto es cierto o falso? (1) Cierto (2) Cierto en parte (3) Falso

The government says that the measures taken to confront the economic emergency will succeed in preventing inflation from surging out of control. Do you believe this is true or false? (1) True (2) Partly true (3) False

Agreement that the PECE (wage-price pact) Controls Inflation [1995:Q32]

En el pasado gobierno, obreros, campesinos y empresarios firmaron acuerdos para controlar que no subieran mucho los precios. ¿Usted cree que estos pactos sirven para algo o no sirven para nada? (1) Si sirven (2) No sirven

In the past, the government, workers, peasants, and businessmen signed agreements to limit the rise of prices. Do you agree that those pacts were useful or useless? (1) Yes, they were useful (2) No, they were not useful

Agreement with Stabilization Program [1995:Q24]

En general, ¿está usted de acuerdo o en desacuerdo con las medidas anunciadas por el gobierno para enfrentar la crisis económica? (1) Acuerdo (2) Desacuerdo

In general, do you agree or disagree with the measures announced by the government to confront the economic crisis? (1) Agree (2) Disagree

1995 Responses	Components		
	Gov. Control Infl.	PECE Control Infl.	Stabilization Prog.
True, yes, agree	33.2%	51.7%	39.6%
Partly true	15.9	—	—
False, no, disagree	50.8	48.3	60.4
Total valid responses	2,395	2,518	2,470
Don't know/No response	421	298	346
N	2,816	2,816	2,816

The Policy Index was computed as the average of all components for that year wherein each Yes/No response was coded Yes = 2 and No = 0 and each Yes/Somewhat/No response was coded Yes = 2, Somewhat = 1, No = 0. Thus, the policy index ends up as a variable ranging between 0 and 2 (the same range as the support variable), but able to take on noninteger intermediate values depending on the set of responses. Descriptive statistics for each year follow:

	Policy Index Frequency Distribution		
	1992	1994	1995
Respondents with:			
Low scores*	424	766	634
Medium scores*	774	1,191	999
High scores*	2,145	1,805	437
Mean	1.52	1.22	0.88
Standard deviation	0.71	0.60	0.71
Total valid responses	3,344	3,762	2,069
Missing	1,616	1,236	747
N	4,960	4,998	2,816

*"Low" scores are all those which fall in the bottom third of the index in a given year. "Medium" scores are those in the middle third. "High" scores are those in the upper third.

Missing Data and Biases in the Policy Indexes

The high percentage of missing data in the policy indexes is attributable in part to the fact that the indexes are composites which eliminate any respondent who answers "don't know" on any of the individual policy items. A comparison of valid responses and "don't knows" for the

indexes showed that persons with limited education and low incomes were underrepresented in the valid responses. In 1994, for example, respondents with no more than an elementary school education comprised 37% of the total sample, 30.2% of the valid responses, and 59.0% of the nonresponses. People classified as "poor" constituted 53.4% of the sample, 48.9% of the valid responses, and 67.0% of the nonresponses. Women and private-sector workers were also underrepresented, but to a lesser extent. Biases were also either more limited or non-existent on questions concerning judgments about the economy and in our measures of political orientation. People making negative judgments about the economy or expressing opposition to the PRI or president were slightly less inclined to answer, but the differences between valid responses and nonresponses were generally between 1 and 3 percentage points.

To assess the impact of these biases, we regressed the individual policy items used to construct the indexes against the independent variables in the general model. With much lower percentages of missing data, the results of these regressions paralleled those for the policy indexes: limited impact for the demographic variables, a larger impact for economic judgments, and political orientations with the greatest effect. It should be emphasized as well that estimates in the policy index models were very similar to those for general support, which had much lower percentages of missing data.

APPENDIX B: INDEPENDENT VARIABLES

Sociodemographic

Sector: [1992, 1994, 1995: QC]

¿En cuál tipo de institución, organismo o empresa trabaja usted? (1) Gobierno federal, estatal o municipal (2) Empresa paraestatal u organismo descentralizado (3) Empresa privada (4) Negocio propio (5) Ejercicio o práctica independiente

In what kind of institution, agency, or enterprise do you work? (1) Federal, state, or municipal government (2) Public enterprise or decentralized agency (3) Private firm (4) Own business (5) Independent profession

[Replies are recoded: 1 + 2 = Public; 3, 4, 5 = Private]

Occupational Sector	1992	1994	1995
1. Federal, state, municipal government	19.1%	16.0%	13.4%
2. Public enterprise/ decentralized agency	4.1	2.7	2.3%
3. Private firm	38.0	37.4	32.3
4. Own business	16.8	18.2	25.6
5. Independent profession	22.0	25.6	26.4
Recoded public [1 + 2]	23.2%	18.7%	15.7%
Recoded private [3 + 4 + 5]	76.8	81.3	84.3
Total valid responses	2,931	2,808	1,490
Don't know/No response	2,029	2,190	1,326
N	4,960	4,998	2,816

Missing data. The very high percentages of respondents who could not be classified as either public or private sector employees accounts for much of the missing data in the OLS regressions in tables 4 and 5. Models estimated without inclusion of "sector" showed similar results for both general support and the policy index, however. As a further check, we ran the regressions with the nonresponses as a dummy variable (DK = 1, Response = 0). The dummy was not significant and had no impact on the other results.

Region: Region of the Country

Mexcity: Living in Mexico City?

The interviewers filled this section with the following categories: *Northeast* (Baja California, Baja California Sur, Sinaloa, Sonora); *West* (Aguascalientes, Colima, Jalisco, Michoacán, Nayarit); *North* (San Luis Potosí, Zacatecas, Nuevo León, Durango, Coahuila, Chihuahua); *Gulf* (Tamaulipas, Veracruz); *Central* (Guanajuato, Hidalgo, México, Puebla, Querétaro, Tlaxcala); *Mexico City* (Federal District and metropolitan suburbs); *South* (Chiapas, Guerrero, Morelos, and Oaxaca); *Southeast* (Campeche, Quintana Roo, Yucatán).

Regions were in turn divided into urban, semi-urban, and rural zones, weighted according to the proportion of such zones in the region, and were divided again into neighborhoods weighted in terms of socioeconomic conditions. Blocks within neighborhoods were chosen for sampling with an equal probability of selection, and households visited were selected with systematic sampling and a random start. Urban strata were those with more than 15,000 inhabitants; semi-urban contained between 2,500 and 15,000; rural were less than 2,500. The coverage of rural and semi-rural areas distinguishes these national surveys from many partial ones that sample only urban populations.

[Categories are recoded: Mexico City—Other]

Party: Electoral Preference for Presidential Election

[1992:Q3]

De los candidatos a la presidencia en las pasadas elecciones de 1988, Cuauhtémoc Cárdenas del PRD, Manuel J. Clouthier del PAN y Carlos Salinas del PRI, ¿con cuál simpatiza usted más? (1) Manuel J. Clouthier-PAN (2) Carlos Salinas-PRI (3) Cuauhtémoc Cárdenas-PRD

Of the presidential candidates in the past 1988 election. Cuauhtémoc Cárdenas of the PRD, Manuel Clouthier of the PAN, and Carlos Salinas of the PRI, whom do you identify with the most? (1) Manuel J. Clouthier-PAN (2) Carlos Salinas-PRI (3) Cuauhtémoc Cárdenas-PRD

[Although not offered as a possible response, interviewers noted when respondent answered with (4) another name or specifically stated "none of these candidates."]

[Recoded as: 2 = PRI; 1 + 3 + 4 = Opposition]

[1994:Q36]

Si hoy se repitieran las elecciones para Presidente de la República y los únicos candidatos fueran el candidato del PRI, Ernesto Zedillo, el candidato del PRD, Cuauhtémoc Cárdenas y el candidato del PAN, Diego Fernández de Cevallos, por cual candidato votaría usted?

(1) Zedillo-PRI (2) Cárdenas-PRD (3) Fernández de Cevallos-PAN

If the election for president were repeated today, and the only candidates were the candidate of the PRI, Ernesto Zedillo, the candidate of the PRD, Cuauhtémoc Cárdenas, and the candidate of the PAN, Diego Fernández de Cevallos, which candidate would you vote for?

(1) Zedillo-PRI (2) Cárdenas-PRD (3) Fernández de Cevallos-PAN

[Although not offered as a possible response, interviewers noted when respondent answered with (4) another name or specifically stated "none of these candidates."]

[Recoded as: 1 = PRI; 2 + 3 + 4 = Opposition]

[1995:Q38]

De los candidatos a la presidencia en las pasadas elecciones del 21 de agosto. Diego Fernández de Cevallos del PAN, Ernesto Zedillo del PRI y Cuauhtémoc Cárdenas del PRD. ¿con cuál simpatiza usted más?

(1) Fernández-PAN (2) Zedillo-PRI (3) Cárdenas-PRD

Of the candidates for the presidency in the past elections of August 21, Diego Fernández de Cevallos of the PAN, Ernesto Zedillo of the PRI, and Cuauhtémoc Cárdenas of the PRD, with whom do you identify the most?

(1) Fernández - PAN (2) Zedillo - PRI (3) Cárdenas - PRD

[Although not offered as a possible response, interviewers noted when respondent answered with (4) another name or specifically stated "none of these candidates"]

[Recoded as: 2 = PRI; 1 + 3 + 4 = Opposition]

Favored Party/Candidate	1992	1994	1995
PAN	11.2%	19.2%	28.9%
PRI	72.5	55.9	41.8
PRD	15.2	11.7	13.5
Other or "No candidate"	1.0	13.3	15.8
Recoded: Vote PRI	72.5%	55.9%	41.8%
Recoded: Vote opposition (not PRI)	27.5	44.1	58.2
Total valid responses	4,294	4,766	2,699
Don't know/No response	666	232	117
N	4,960	4,998	2,816

Results of the August 1994 presidential elections: Zedillo (PRI): 48.8%; Fernández (PAN) 25.9%; Cárdenas (PRD) 16.6% and Cecilia Soto (PT) 2.7%.

Democracy, War Initiation, and Victory

DAN REITER *Emory University*

ALLAN C. STAM III *Yale University*

How do nation-states' political institutions affect the relations between states? This article addresses that question by testing the predictions of different theories linking political institutions to war outcomes. Specifically, rent-seeking and regime legitimacy theories predict that all democratic belligerents are more likely to win wars because they fight more effectively. Alternatively, other theories focusing on the domestic political vulnerability of leaders and the marketplace of ideas predict that democracies are likely to be more careful about choosing when to start war. This would mean that only democratic initiators are more likely to win. Analyzing all interstate wars from 1816 to 1982 with a multivariate probit model, we find that democratic initiators are significantly more likely to win wars; democratic targets are also more likely to win, though the relationship is not as strong. We also find empirical support for several control variables, including strategy, terrain, and capability.

Recent empirical scholarship has noted that democracies are significantly more likely to win the wars they fight than are other types of regimes. Though this finding refutes the general realist claim that regime type is unrelated to foreign policy behavior, it also begs the important theoretical question of why democracies are more likely to win wars. Since different theories of foreign policy behavior provide different answers to this question, discerning the real reasons would advance our theoretical understanding of foreign policy behavior.

Scholars offer two different general arguments to explain democracies' winning ways. First, they are perceived as intrinsically more effective at waging war than are nondemocracies (hereafter termed the "war-fighting" explanation), primarily because it is easier for them to rally their society behind a war effort. Second, as derived from several theories, democracies win more often because they are more careful about deciding to initiate war (hereafter termed the "selection-effects" explanation). Significantly, the theoretical assumptions of the latter argument are consistent with the structural explanation of the tendency for democracies not to fight one another, popularly known as the democratic peace.

This article explores in detail why democracies are more likely to win wars, specifically comparing the war-fighting and selection-effects explanations. Our empirical tests discriminate between these explanations by exploring whether democracies are more likely to win all wars in which they participate (predicted by

the war-fighting explanation) or just those they initiate (predicted by the selection-effects explanation). Our examination of all interstate wars from 1816 to 1982 finds that initiating democracies are significantly more likely to win wars than any other kind of belligerent. We also find limited support for the proposition that democracies which are attacked are more likely to win wars than are other kinds of targets. These results are in noteworthy contrast to previous empirical studies for three reasons: We use a more complete sample, account for possible interactions between democracy and initiation, and include a more complete set of control variables.

The article has four parts. The first presents the theoretical arguments relating domestic regime type to conflict behavior. The second discusses hypotheses, operationalization, and the data set. The third presents empirical results. The fourth offers conclusions.

REGIME TYPE AND CONFLICT BEHAVIOR

Are democracies more likely to win wars? Mainstream thinking during the twentieth century has occasionally doubted the ability of democracies to defend themselves, especially during the 1930s and the Cold War. Recently, however, scholars have examined the entirety of the post-Napoleonic historical record with quantitative tests and have found that when democracies fight, they tend to win, and their wars are of shorter duration (Bennett and Stam 1996; Lake 1992; Stam 1996). What we call the war-fighting and selection-effects arguments have been advanced to explain this phenomenon.

The war-fighting explanation argues that democracies simply fight wars more effectively than do other kinds of states. Lake (1992) developed a model of the state as rent-seeker and posited three reasons for democracies' superior war-fighting abilities. Democracies extract fewer rents from society, hence are wealthier and devote more resources to security. They form overwhelming countercoalitions against aggressors. Democratic governments can extract higher levels of support from society for a war effort. We discuss each of these arguments in turn; we believe the last is the most persuasive.

Dan Reiter is Assistant Professor, Department of Political Science, Emory University, Atlanta, GA 30322 (dreiter@ps.emory.edu). Allan C. Stam III is Assistant Professor, Department of Political Science, Yale University, New Haven, CT 06520-8301 (allan.stam@yale.edu).

The authors' names are listed alphabetically; the order does not connote principal authorship. The authors thank the following for their invaluable assistance: Scott Bennett, Bruce Bueno de Mesquita, David Davis, Christopher Gelpi, Ali Ghobadi, Joshua Goldstein, Paul Huth, Gary King, David Lake, David Leblang, Shoon Murray, James Ray, Patrick Regan, Bruce Russett, Randall Siverson, Scott Tarry, Alexander Wendt, attendees at Emory and Yale seminars on international security, and several anonymous reviewers. The authors are solely responsible for any remaining errors.

The rent-seeking argument has logical shortcomings. The model assumes that democracies are wealthier because they extract fewer rents from their society than do autocratic states, leading to greater wealth, which in turn means more resources for the military. Yet, one important reason states extract rents is to increase military spending, so fewer rents also would mean a smaller percentage of GDP devoted to military spending. Hence, the model does not necessarily predict that democracies devote more resources to military spending than do autocracies. Though the economic pie may be larger for the former, military spending is a relatively smaller slice. Indeed, according to the model, democracies prosper for that reason. In order for the rent-seeking argument to predict that democracies can generate a strong military, additional assumptions need to be made about an economic multiplier effect of reduced rent-seeking, which means that proportionately more rents are available in the long run. Logical shortcomings aside, empirical studies have found that democracy does not cause prosperity, though higher levels of economic development may make democracy more stable (Przeworski and Limongi 1997).

Although the argument that democracies form overwhelming countercoalitions contains compelling logic, even anecdotal evidence in support of this claim is scarce. Lake's (1992, 33) data included 30 wars from 1816 to 1982 in which democracies participated. In only six of these was there more than one democracy on any side, meaning that in 80% of the cases a lone democracy could attract no support from a sister regime. Of the six wars that involved a democratic coalition, four were won by the coalition (the Boxer Rebellion, the Sinai War, and the two world wars; the 1991 Gulf War also might be included), which fought for imperialist or realist motivations; democracies did not declare war primarily to come to one another's rescue.

Finally, the argument that democratic governments enjoy widespread support and therefore can extract more contributions for the war effort seems more tenable. In a study of major battles since 1800, Reiter and Stam (1998; see also Reiter and Stam 1997) found that soldiers fight better under democratic governance than under other regime types. Specifically, democratic armies fight with greater initiative and better leadership than do the armies of other kinds of states, which the authors attribute to the emphasis on individual prerogative in democratic political systems. Note that we are not arguing that democratic governments are more effective at extracting economic resources from society during wartime; empirical studies cast doubt on that particular claim (Kugler and Domke 1986).

Distinct from the war-fighting explanation is the selection-effects argument. It maintains that democracies tend to win more often because they are more careful than autocratic states about deciding whether to initiate war. Significantly, this risk aversion may account for the empirical observation that democracies are more likely to win wars (see Achen 1986). Testing for the selection effect may lead to new and significantly different conclusions about the nature of state power, as was the case in studies of deterrence (Fearon

1994) and the democratic peace (Rousseau et al. 1996).¹

Scholars make two distinct arguments in favor of the selection-effects explanation. The first centers on democratic electoral institutions. When faced with a displeased public, democracies are generally more likely than other governments to lose power, since the latter need not hold regular, competitive elections. Moreover, autocracies are less constrained in their use of state power to suppress dissent. Therefore, democratic leaderships are more likely to lose power following a military defeat—an event quite likely to generate popular dissatisfaction—than are nondemocratic leaderships (Bueno de Mesquita and Siverson 1995; Downs and Rocke 1994). An important implication is that fear of postdefeat political consequences motivates democracies to initiate war only when they are relatively certain of victory. Consider that democratic Israel has won all the wars it has initiated (the Suez, Six-Day, and Lebanon wars). Conversely, in the 1898 Fashoda Crisis, democratic France backed down when its leadership realized the considerable military inferiority it faced against the British.

Following this logic, nondemocratic leaders are less likely to lose power after a defeat and hence are more likely to undertake risky military ventures. Saddam Hussein initiated costly wars against Iran and Kuwait but retained power. This, despite the fact that one ended in an extremely bloody stalemate, and the other conflict ended in perhaps the most decisive military defeat in modern history. The expectation, then, is that because democracies are cautious initiators, they have a higher probability of victory than nondemocratic initiators. This argument shares common theoretical assumptions with the structural explanation of the democratic peace. That is, democracies tend to be more peaceful than other kinds of states (at least in their relations with one another) because their political institutions constrain leaders from pursuing belligerent foreign policies (see Bueno de Mesquita and Lalman 1992; Russett 1993).

A second argument in support of the selection-effects explanation posits that since democratic governments benefit from more and higher quality information, they are more likely to make better policy and therefore only initiate winnable wars. The proposition that the vigorous discussion of alternatives and open dissemination of information in democratic systems produce better decisions is an idea at the core of political liberalism, traceable to thinkers such as John Milton, Thomas Jefferson, and John Stuart Mill. Specifically, a free press with limited government control or censorship is more likely to expose the flaws in

¹ One possible selection bias that may remain in our model stems from limiting our dependent variable to war and the concomitant exclusion of lower levels of violence. One may argue that in some cases the real initiation decision comes at lower levels (such as the decision to show force), so that focusing solely on the change from peace to large-scale war obscures important dynamics. We doubt that this is a problem with our model, given that the move to large-scale war is the most important and salient threshold in the escalation ladder of violence.

policy and improve government stewardship. In the modern international relations literature, scholars have posited that the relatively open marketplace of ideas engendered by a free press decreases the chances that democratic leaders will engage in foolhardy wars (Snyder 1991; Van Evera 1994, 32–3). In addition, the less politicized bureaucracies of democratic governments are more likely to generate higher quality, less biased information (see Reiter 1995b, 47–9). Specifically, in authoritarian regimes, the military is likely to provide lower quality information to the leadership. Following this logic, authoritarian governments are more likely to promote military officers based on political loyalty, as they fear potential threats to their hold on power from a disgruntled military. This toadyst phenomenon has been called “commissarism,” one side effect of which is biased military intelligence, as officers are more interested in maintaining the approval of civilian leaders than in presenting sound military or strategic analysis (Pollack 1996, chapter 3). The bottom line is that since democratic leaders get better information from both society and their own bureaucracy, they are more likely to make better policy and therefore avoid starting losing wars.

Empirical work supports various aspects of these theories. As noted, both Stam (1996) and Lake (1992), while failing to control for selection effects, found that democracies are more likely to win. Siverson (1995) found that democratic initiators suffer significantly fewer casualties than other kinds of war participants. This strengthens the selection-effects argument, since higher casualties are likely to increase the domestic political threat to democratic leaders, and concerns about those repercussions may guide their war initiation decisions (see also Gartner and Segura 1998). Bennett and Stam (1996) found that democracies tend to fight shorter wars, which also is consistent with the selection-effects explanation; democratic leaders should prefer shorter wars, as they are likely to fear that public support will dissipate as a war drags on. Finally, research on the tenure of regimes following war confirms important links between the outcome and domestic politics (Bueno de Mesquita and Siverson 1995).

Empirical research, however, has not provided a test that discriminates between the war-fighting and selection-effects explanations. This is unfortunate, as these stem from very different assumptions, and more careful validation of variables could prove useful in theoretical debates. The empirical tests presented here endeavor to determine whether one, both, or neither explanation has validity.

HYPOTHESES AND DATA

Conceptual Framework and Hypotheses

Our unit of analysis is the single nation participating in war, and the dependent variable is whether that nation experienced military victory or defeat. To understand who wins wars, our conceptual framework integrates war initiation and outcomes (our ideas are closely

related to those of Gartner and Siverson 1996). Assume that when a state's leadership decides whether to initiate war, it makes a subjective probability assessment that it will win (W ; a number ranging from 0 to 1) and that states prefer winning to losing. Assume further that a state chooses to initiate war if W surpasses some threshold (T) value of acceptable risk. Also assume that W reflects, at least to some extent, a state's real, objective probability for victory (V). Drawing on the cost-benefit approach laid out by Stam (1996), we argue that a war ends when one side concedes defeat because it has absorbed more costs than it is willing to bear to achieve the foreseen benefits of victory. Therefore, V rises when a state's threshold of cost acceptability rises, when a state can inflict greater costs at a greater rate, and/or when it can reduce the rate at which it suffers costs.

From this set of assumptions, we deduce a number of specific hypotheses. These are presented next, along with the operationalization of independent variables.

HYPOTHESIS 1: *War initiators are more likely to win than targets.*

Since W (subjective belief that the state will win) is related to V (the objective probability of victory), we should observe that initiators are more likely to win than targets. States with a greater objective chance of victory will select themselves into the population of war participants by launching wars, whereas states with a lower objective probability of victory are selected into the population of targets for attack. The proposition that all initiators should be more likely to win wars is central to the literature on conflict behavior (Bueno de Mesquita 1981; Wang and Ray 1994). We closely equate “initiating war” with the stronger phrase “choosing war.” There are very few examples of states being forced to initiate war because they feared imminent attack (the only democratic example is Israel in 1967 [Reiter 1995a]).² *Initiation* is a dichotomous variable, 1 for initiators and 0 for noninitiators.³

Our conceptual framework proposes that cautious decision making by democracies relates only to their role as initiator, not target; that is, the selection effects apply only to those which start wars, not to those which are attacked. We assume that targets must accept war when attacked. It may be argued that they can choose

² Some scholars disagree with the notion that states choose war, positing instead that states are usually forced into it by circumstances beyond their control. Of course, if war does not reflect a real choice, then in our data analysis the initiation terms will not be significant.

³ Our initiation codings differ slightly from those of the Correlates of War (COW) project (Small and Singer 1982). Aside from three cases that we divide (the two world wars and the Vietnam War), we follow the arguments in Dupuy and Dupuy (1986) and Clodfelter (1992). We made two changes from the COW initiation codings. In the Crimean War, we code Russia as the initiator, not Turkey. In the First Balkan War, we code the three members of the Balkan League as coiniciators.

One also may argue that states which join wars are conceptually similar to those which initiate wars. We tested for this possibility. When we recoded the initiation variable to include states that join because of a defense pact with a belligerent or because an ongoing war threatens their national interests, the results were largely the same, though substantive and statistical significance were weaker.

not to fight, but if this were the case, then perhaps the selection-effects explanation would imply that democratic targets are also more likely to win than are nondemocratic targets. Weak democratic targets would be more likely to accept peaceful surrender over military defeat, as Denmark did in 1940 when Nazi troops crossed the border.

The assumption that targets must fight does not undermine our findings. Our empirical tests will allow us to discern whether targets have the range of choice available to initiators. If so, then we should find that initiators—democratic or otherwise—have no greater chance of winning than targets. Regardless, there are almost no cases of peaceful surrender aside from Denmark, though there are several cases of small targets electing to fight when attacked, even against overwhelming odds, such as all the other small European neutrals in World War II. Leaders tend to place a higher utility on defeat in battle than on peaceful surrender for three reasons. First, abject surrender probably would end their personal political career, while choosing to fight vainly would permit the possibility of postwar leadership. Second, honor supports power, as a country that allows itself to be conquered peacefully brands itself for decades to come as a feckless weakling to be bullied (Kagan 1995, 8–9). Third, leaders treat the choice to defend one's own land as an insubvertible good, and honor in defeat is intrinsically preferable to ignominious surrender. Consider Belgium's choice at the outbreak of World War I. In the first days of the war, Germany presented an ultimatum: Allow us to move peacefully through your territory to reach France, and we will honor Belgian sovereignty after the war and recompense any damages; oppose such movement, and face destruction. Faced with a relatively attractive offer and the prospect of military annihilation, the Belgians still fought (Tuchman 1962, 124).

HYPOTHESIS 2: *Democratic targets are more likely than other kinds of targets to win wars.*

HYPOTHESIS 3: *Democratic initiators are more likely than other kinds of initiators to win wars.*

The war-fighting explanation posits that all democratic war participants, initiators and targets, win more frequently because they fight more effectively. In other words, within the context of our framework, V is likely to be higher for democracies. The war-fighting explanation makes no assumptions about W or T varying among states. The straightforward implication is that all belligerents—both initiators and targets—are more likely to win if they are democratic. The war-fighting explanation implies both hypotheses 2 and 3.

As discussed previously, the selection-effects explanation proposes that, because democratic leaderships fear being turned out if a war is lost, they are likely to initiate only those wars which they are confident of winning. Within the context of our framework, this implies that T will be systematically higher for them than for leaders in nondemocracies. The selection-effects theory predicts that democracies will only initi-

ate war when W is high. We also expect that their estimates of W will closely approximate V . If democracies grossly overestimate their chances of victory ($W \gg V$), then we would fail to observe the hypothesized relationship between democratic war initiation and victory. The selection-effects explanation implies only Hypothesis 3, not Hypothesis 2.

HYPOTHESIS 3a: *Among initiators, democracies are the most likely to win, followed by dictatorships, followed by mixed regimes.*

Hypothesis 3 implies a monotonic relationship between regime type and outcomes for initiators: The more democratic they are, the more likely they are to win. An alternative approach is to relax the monotonicity assumption. The study of imperial overexpansion by Snyder (1991, 21–65; for a different theory relaxing the monotonicity assumption, see Goemans 1997) suggests that there may be a more complex relationship. Following Snyder's theory, democracies are still most likely to initiate only wars they believe winnable, owing to the prospects for postdefeat political punishment and the benefits of the marketplace of ideas. Dictatorships should be more risk acceptant, since dictators need not fear the political fallout from losing and do not benefit from a marketplace of ideas, but some dictators may have the ability to make clear-sighted foreign policy, and thus avoid starting unwinnable wars. Therefore, it is mixed regimes that are especially likely to start misguided military ventures, because their corporate or oligarchic political structure engenders logrolling and militarist mythmaking.

To test hypotheses 2, 3, and 3a, we use democracy and autocracy scores from the Polity III data set (Jagers and Gurr 1995). These scores are aggregations of the degree of system openness, the degree of participation, and the degree of competitive candidate selection. The democracy scale ranges from 0 to 10 (0 = absence of democratic institutions; 10 = very strong democratic institutions). The autocracy scale also ranges from 0 to 10 (10 = most autocratic). We combine the two into a single *Politics* index by subtracting the autocracy scale from the democracy scale, which results in a 20-point scale, with +10 representing the most democratic states and –10 the least. Some countries that were invaded and conquered in the same year (such as Norway in 1940) are coded by Polity III as having missing democracy and autocracy scores. For these cases, we used the scores in the previous year, as the “missing” scores reflect the lack of a normal political system during occupation; these countries were functioning polities prior to invasion and during the war, which means that our hypotheses can make predictions about how their political system affected war outcomes.

To test our various hypotheses linking regime type and war outcomes, we used two functional forms, each with a different set of interaction terms. In one functional form, we added two interaction terms: (1) a state's *Politics* score times the dichotomous initiation variable and (2) a state's *Politics* score times a dichotomous target variable, which is coded 1 if the state is a

target (not an initiator) and 0 if it is not a target (an initiator). Hypothesis 2 predicts that the *Politics*Target* term will be positive, and Hypothesis 3 predicts that the *Politics*Initiation* term will be positive. The war-fighting explanation predicts that both terms will be significant, while the simpler, monotonic selection-effects explanation predicts that only the *Politics*Initiation* term will be significant. Inclusion of an interaction term is a new approach, since Lake (1992) considered initiation and democracy as independent variables.⁴

Testing Hypothesis 3a, which envisions a nonmonotonic selection-effects relationship, requires a different functional form for the independent variables. To test for the expected curvilinear relationship in the *Politics*Initiation* term, we used a pair of fractional polynomials (see Royston and Altman 1994). To compare the curvilinear selection-effects explanation to the war-fighting explanation we then need three terms. The first is a state's politics score multiplied by a dichotomous target variable, which is coded 1 if a state is a target (meaning it is *not* an initiator) and 0 if a state is not a target (meaning it *is* an initiator). There are also two terms of a transformed independent variable: The transformation for the first term is $x^{-1/2}$ and for the second term is $x^{-1/2}(\ln(x))$, where $x = (\text{Politics*Initiation} + 11)/10$. This transformation is a relatively simple fractional polynomial (e.g., we could have squared or cubed x , but doing so gains little, either substantively or statistically). The polynomial specification allows for a curve that starts at a medium level for a politics score of -10 , dips down to a lower level as the scores increases, but then rises to a higher level as it approaches $+10$. With this alternate functional form, the democratic selection effects are supported in the curvilinear manner predicted by Hypothesis 3a if the transformed independent variables are statistically significant. Due to the complex nature of the transformation, we will leave interpretation of the signs of the coefficients to the results section. Among targets, democracies have an advantage (an effect predicted by Hypothesis 2) if the *Politics*Target* interaction term is positive and significant.

In contrast, realists are generally skeptical about a relationship between domestic political structure and international conflict, a point often made in critiques of the democratic peace proposition (see Mearsheimer 1990). In our framework, there would be no relationship between W , T , or V and a state's level of democracy. This implies that regime type should be unrelated to war outcomes (see Wright 1965, 163). Morgenthau (1978, 143–6) did argue that the quality of government and national character or morale are important factors in state power, though he did not believe that these are systematically related to whether the state is democratic. Realism predicts that we will not find either substantive or statistical support for hypotheses 2, 3, and 3a.

Control Variables

A variety of factors unrelated to regime type or initiation should systematically influence the objective probability of victory in war (V). Realism proposes that these variables provide a virtually complete explanation of war outcomes. Though our main theoretical interest is to trace the effect of political structure on war outcomes, excluding these factors from the analysis would risk biasing our results, which in turn could lead to incorrect inferences about the relationship between political structure and war outcomes. Our choice of control variables is driven by theory and empirical research on the determinants of war outcomes (e.g., Stam 1996).

HYPOTHESIS 4: *The greater a state's relative advantage in material capabilities, the greater are its chances of winning a war.*

As a state's advantage in military-industrial capabilities rises, its chances for victory rise, since it will be able to inflict greater costs upon its opponent relative to the costs it will suffer. We operationalize this variable as each actor's *Capabilities* as a proportion of all participants' capabilities. We use the COW composite capabilities index as our indicator. It is composed of industrial production, military troops, military spending, energy consumption, and proportion of urban to total population.⁵

HYPOTHESIS 5: *States with a military of higher quality will have a greater chance of winning.*

Since militaries are the tools of war, higher quality militaries ought to increase the chances of victory (Van Creveld 1991). Specifically, superior military technology and training should translate into fighting forces that can more efficiently inflict costs on the opponent (Arquilla 1992, 81–5). We used an indicator that can be measured by *ex ante* information. We assume that states with a higher *Quality Ratio* (spending rate per soldier, relative to their opponents) will have a correspondingly higher level of technology, equipment, and training (Huth, Bennett, and Gelpi 1992; Stam 1996). The military spending and troop numbers come from the COW data set.

HYPOTHESIS 6: *The better a state's choice of military strategy, the greater are its chances of winning a war.*

Strategy can have a major effect on a state's ability to absorb and inflict costs and hence on the prospects for victory. We categorize military strategies as maneuver, attrition, and punishment (see Mearsheimer 1983; Posen 1984; Stam 1996). We then match each with either offensive or defensive political goals, or doctrine. It is important to note that the effectiveness of a particular strategy also depends on the adversary's choice of strategy. We predict the effectiveness of various combinations based on two assumptions: Min-

⁴ Lake (1992, 36n) seems to have checked for a possible democracy-initiation interaction effect, but he only mentions briefly that he found no significant relationship.

⁵ We do not discount nations' material contributions based on when they joined the war. The inevitable imprecision and inaccuracies of any discount formula would outweigh any reduction in bias it might achieve.

imizing one's own military losses is better, and the side trying to change the status quo prefers quicker outcomes (see Stam 1996).

We coded military strategy as a set of dummy variables following Stam's (1996) procedures. The first step is to determine whether a state has offensive (*O*) or defensive (*D*) political goals, based on Dupuy and Dupuy (1986) and Holsti (1991). Next, we coded the choice of maneuver (*M*), attrition (*A*), or punishment (*P*) strategies, following the analysis in Dupuy and Dupuy (1986), Dupuy (1983), and Clodfelter (1992). We coded blitzkrieg strategy, or encircling and dividing the opponent's forces, as maneuver. A focus on annihilation of the enemy and/or seeking decisive battles was coded attrition. Cases in which Maoist guerrilla tactics were used or in which civilians were the principal military targets were coded punishment. If multiple strategies were employed, then we chose the one that absorbed the majority of the state's military assets. If there was more than one country on a side, then we coded the strategy of the largest state (in terms of capabilities). In the three cases of no clear distinction between maneuver and attrition, we coded the modal strategy of attrition (see Bennett and Stam 1996, 247n).

For each belligerent, we code its goals and strategy, and those of its opponent with a four-letter code. For example, OADP indicates that one party has offensive goals and an attrition strategy, and the other has a defensive doctrine and punishment strategy. We also grouped all possible strategy codings into pairs and ranked the effectiveness of each pair. Not all possible strategies are observed, however. Among those that are observed, we rank the strategy pairs as follows starting with the most effective: OMDA/DPOA; OPDA/DMOA; OADA/DAOA; OADM/DAOP; OADP/DAOM. Five dummy variables are used to account for the observed strategy combinations. To avoid perfect multicollinearity among the strategy categories, we omitted from the regression models the dummy category representing OADP/DAOM (for more discussion, see Stam 1996).

Our strategy variables are certainly simplifications of reality, but the general aim of most military theorists is to propose concepts about the execution of combat that transcend a particular military environment. The essential issue is whether our conceptualizations explain more than they obscure. We believe so, if for no other reason than that this set of strategy variables has been found to be significantly correlated with both war outcomes and duration (Bennett and Stam 1998).

Our model also simplifies reality by coding each belligerent as having a single strategy throughout the war (see Gartner 1997). Fortunately, there are very few cases in which belligerents made strategy changes from one of our categories to another. We reduce the potential problem of intrawar strategy change by breaking the two world wars and the Vietnam War into shorter components (discussed in detail below).

HYPOTHESIS 7: *Appropriate terrain will increase a state's chances of victory.*

Terrain significantly enhances or diminishes the effectiveness of a strategy choice. For example, the maneuver strategy of one side can better exploit the attrition strategy of the other side on flat plains than in mountainous jungle. Terrain codings come from *New York Times Atlas of the World* (1983) and correspond to the location of the majority of battles fought during a war (Dupuy and Dupuy 1986). We then scaled the terrain types to match the predicted movement times, using data from Dupuy (1979, 1983) that estimate movement speed over various terrains. In cases involving more than two actors on one side, we used the average of terrain scores weighted by the size of the forces fighting in particular terrain. The final terrain index ranges from 0.3 to 1.2; 1.0 corresponds to the speed at which vehicles and troops can move on open rolling terrain, similar to the plains of Eastern Europe. Higher scores correspond to desert areas with flat, hard-packed surfaces. A score close to 0.3 indicates very difficult movement for vehicles, such as rugged mountains and dense jungles.

Our model includes two terrain variables, a *Strategy-Terrain* interaction variable and, as a control, the terrain variable alone. To measure the interaction term, we would normally multiply the two variables. Unfortunately, with dummy variables to control for strategy choice, the inclusion of each terrain interaction dummy would create multicollinearity problems with the strategy dummy variables. Instead, we used a scaled strategy index with terrain, which reduces multicollinearity (as revealed by partial correlations) by creating a single variable with a larger range of values rather than several variables with a more limited range. This scaled strategy variable is coded 1 through 5, a ranking of the observed strategies listed above.⁶

HYPOTHESIS 8: *The greater the distance between the war participant and the site of combat, the lower are the chances of victory.*

Several authors hypothesize a correlation between *Distance* and the chances of victory (Stam 1996). Bueno de Mesquita (1981, 41) argues that a state's ability to inflict costs or exert power declines over distance, which may affect a state's ability to raise the costs of war for an opponent or minimize its own costs. We measure distances in miles from capital to capital, using Fitzpatrick and Modlin (1986) and *New York Times Atlas of the World* (1983).

HYPOTHESIS 9: *The more powerful a war participant's allies, the greater are its chances of winning.*

Alliance Contributions are at the core of the realist vision of international relations and waging war (Morgenthau 1978). A state's allies increase the costs its opponents must bear and reduce its own costs. Yet, the contributions to a state's power from its allies must be

⁶ We score the most effective offense and defense strategies (OMDA and DPOA) 1, the next most effective 2, and so forth, to the least effective strategies (OADP and DAOM), which we code as 5. Including the scale or individually multiplied dummy variables makes little difference in the overall results of the model, as the fit remains nearly identical.

discounted compared to the state's own military and industrial capabilities. At the operational level, it is likely that differences in factors such as command structure, technology, training, and communication equipment may hinder effective coordination. Allies also have to defend themselves and will reserve some of their forces for that purpose. We thus separate out alliance contributions from the resources of the belligerents. Alliance contributions are measured in the same fashion as the state's military-industrial capability, using the COW data, that is, as a fraction of the total capabilities of all states involved in the war. Because we have no discount formula for allies, we include these contributions as a separate term to permit measurement of their independent effect.

Data Set

Our population for analysis is all participants in interstate wars between 1816 and 1982.⁷ They were identified by the COW set of interstate wars (Small and Singer 1982) and Dupuy and Dupuy (1986). The hypotheses we test concerning polity type relate only to the likelihood of victory. Accordingly, we simplified the analysis by dropping draws from the data set, leaving 197 cases.⁸

Unlike the COW data set, ours disaggregates World War I and II and the Vietnam War into multiple wars. Our goals were to distinguish between separate military campaigns (for example, the German campaign against France in 1940 and against the Soviet Union) and to err on the side of conservatism, that is, to create fewer rather than more new wars. World War I we divide into three campaigns: Germany versus Belgium, Germany/Austria/Turkey versus Russia, and the Allied Powers (minus Russia and Belgium) versus the Central Powers (see Edmonds 1951). World War II we divide into several campaigns: Germany versus individual

European countries as separate wars, Germany versus the Soviet Union, the Pacific War, and the United States and Great Britain versus Germany and Italy. The Vietnam War we divide into the United States and South Vietnam versus North Vietnam, a phase lasting until 1972, and North versus South Vietnam.

This separation makes our data set more historically accurate; these long coalition wars can be thought of as aggregations of distinct conflicts. Decision makers rarely anticipate or think in terms of large systems of wars, but usually in terms of sequences of opponents. In the case of World War II, Dupuy and Dupuy (1986), among many others, identify separate and distinct negotiated settlements among the various participants as well as fundamentally independent war-fighting efforts.⁹ Disaggregation also affords two important advantages for testing the hypotheses. First, it permits more accurate distinctions between winners and losers. In long coalition wars, members of the losing coalition may score distinct campaign victories against members of the ultimately victorious coalition. For example, our method permits us to classify Russia and Belgium as losers in World War I and Poland and Norway as losers in World War II, whereas the COW data set views these four countries as winners. Conversely, our method recognizes the execution of successful military campaigns by countries that went on to lose, such as Germany's campaign against the Netherlands in World War II. Second, disaggregation allows us to code the independent variables more accurately. Dividing long wars of global reach into distinct campaigns greatly improves coding accuracy for such variables as strategy and terrain.¹⁰ This advantage may not be trivial; one scholar found that how one treats cases from the two world wars determines whether one finds significant correlations between military buildups and the outbreak of war (Diehl 1983).

EMPIRICAL RESULTS

We first present a simple contingency table listing victory-defeat records for states classified by the politics index and initiation. A war participant was coded democratic if its politics score was +7 or higher, mixed regime or "anocratic" if the score was -6 to +6, and autocratic if the score was -7 or lower. In Table 1,

⁷ Some may argue that it would be better to focus on the core dyad in each war, but we include all belligerents for two reasons. First, if the dependent variable is war outcomes, then there is no theoretical justification for excluding them. For war initiation, it may be more important to think about the primary disputants, but membership in the core dyad is less relevant to performance during the war. Second, including only the core dyad would leave out relevant information. We enhance confidence in the results if we broaden the empirical sample. Furthermore, note that model 6 in Table 2 includes only core dyads, and the results are largely the same.

⁸ Analyzing the data with draws included does not substantially change the results. One variable that we eventually dropped from the analysis, geographic distance, is statistically significant if we include draws. States fighting in distant wars are more likely to settle for draws than states fighting near their borders.

In addition, we note that our data set differs from Lake's. From the COW list, Lake (1992, 31; 33, 35n) used only wars in which at least one democracy participated, minus the Spanish-American War and wars in which there was no clear victor. Lake also restricted the size of his sample by using a version of the COW data set that extends only to 1965 (20 wars). We believe our sample is richer and likely to contain fewer sources of bias; it covers up to 1982 (77 wars), includes the Spanish-American War, and does not exclude wars in which no democracy participated. The results do not change significantly if we only use cases up to 1965, though standard errors do increase somewhat. Finally, Lake did not disaggregate the two world wars and the Vietnam War, as we did.

⁹ The results were quite similar even when we omitted our disaggregation; because that reduced seventeen wars to three, *all* the standard errors increased slightly. The coefficient estimates were stable, though the strategy and terrain variables could not be estimated because of insufficient variance among the independent variables.

¹⁰ The COW codings are based, in part, on an attempt to generate a data set useful for testing propositions about systemic wars and the mechanism through which bilateral wars become multilateral. The COW outcome codings do not attempt necessarily to reflect the outcome of waging war. For example, while Germany clearly defeated Poland in World War II, the Polish government in exile remained allied to the U.S. and British war effort. Consequently, COW codes Poland as being on the winning side, although they were defeated in battle. We are interested in the process of waging war, so we treat each war separately; they are aggregated into multilateral wars only if that was the way the battles were actually waged. The 1973 Arab-Israeli conflict is an example of a multilateral war we did not disaggregate.

TABLE 1. War Outcomes by State Type and Initiation

Outcome	Democracy	Anocracy	Autocracy	Total
Initiators				
Win	14	21	21	56
Lose	1	15	14	30
Targets				
Win	12	18	16	46
Lose	7	27	31	65

$\chi^2 (6) = 12.7, p = .048.$

entries are victory-defeat records. The probit analysis, which follows, uses the -10 to +10 politics scores.

As a first and somewhat crude cut, Table 1 indicates preliminary support for hypotheses 1, 2, and 3—our baseline model. There is no apparent support for Hypothesis 3a, that is, a curvilinear relationship between regime type and victory. Initiators and democracies appear to be more likely to win, and democratic initiators appear to be especially likely to win. The general results are statistically significant at the $p < .05$ level.

While interesting, the results in Table 1 may also be an artifact of correlations with other determinants of victory. For example, democratic war initiators may have the most powerful armies. To test for this and other possible factors, we used a more fully specified, multivariate model. A probit model was chosen because of the dichotomous nature of the dependent variable. Applying a linear model would risk introducing specification error and biased coefficients. Table 2 presents the probit regression results of several models.¹¹

In model 1, our baseline, we include terms for the interaction between the politics variable and both initiators and targets. We also include a variable marking whether the state was an initiator. Note that in this model we cannot test the nonmonotonic Hypothesis 3a, which is addressed below. Regardless, concerning the effects of democracy, the Politics*Initiation term is in the hypothesized direction and statistically significant.¹² We also see that democratic targets appear to perform somewhat better during war, and we find support for the selection-effects argument. Yet, with this simple model we cannot ascertain the individual validity of the rent-seeking, democratic countercoalitions, or state legitimacy arguments.

To test Hypothesis 3a (a nonmonotonic relationship among politics, initiation, and victory), we also fit a fractional polynomial model. In model 2, we find

similar results for the initiation term. The parameter estimate for the Politics*Target term is relatively stable, although it is no longer statistically significant. In this arguably incomplete model of outcomes the fractional polynomial terms (interacted with initiation) are not supported—leading to preliminary rejection of Hypothesis 3a—but it is possible that including additional data may allow for less biased estimates of the polynomial terms. Recall Lake's claim that democracies should be more likely to win because they devote more resources to the military and assemble overwhelming countercoalitions, and it is these variables that should determine war outcomes. This implies that if we control for these factors, then the effects of democracy may drop out of the equation. First, we tested our model of military factors absent the domestic politics variables. Model 3 might best be termed a realist model of war outcomes. It is devoid of state polity characteristics and includes variables marking military-industrial capability, alliance contributions, and military quality as well as several markers for strategy and strategy-terrain interactions. In general, we find strong support for this realist approach.

Next, in model 4, we include the regime type variables from model 1, and all the politics terms from our base model are still statistically significant. This increases our confidence in the validity of the selection-effects explanation. It also implies that democratic targets tend to be more powerful, which is consistent with all three of the arguments underlying the war-fighting explanation. In model 4, however, we have controlled for alliances and industrial capability, two of the factors that Lake (1992) highlights in his presentation of the war-fighting explanation. We still observe a relationship between democracy and war outcomes; indeed, it appears both substantively and statistically stronger, not weaker, when we add the realist controls. This seems to support Lake's empirical generalization, but not for all the reasons he outlined. Though there is no direct evidence here, the results do not contradict the validity of the state legitimacy proposition. In addition, we ran tests to see whether adding political variables in model 4 makes a statistically significant improvement to our explanation of the dependent variable. A likelihood ratio test demonstrates that the gains in model 4 over model 3 are statistically significant at the $p < .01$ level.

In model 5 we substitute two fractional polynomial terms for the Politics*Initiation interaction. Unlike model 2, the inclusion of a more fully specified model of outcomes indicates some support for the nonmonotonic Hypothesis 3a. Note that although the interaction terms in both models 4 and 5 are statistically significant, model 5 is preferable to model 4. The improvement in the fit of the overall model from the inclusion of two fractional polynomial terms, compared to the linear term, is significant using a conservative test at the $p < .02$ level.¹³ This encourages preference for the

¹¹ We also fit the same models to the logit distribution. In these models, the parameter estimates were essentially the same; the standard errors increased somewhat. In the baseline model with the logit estimates, the democratic target term did not meet standard levels of significance ($p = .052$).

¹² Models 1 and 2 do not include an estimate for a constant. When included, the absolute values of the standard errors exceeded the estimate of the constant itself. In runs with a constant estimated, the coefficients for all variables remained stable, with the p -value for all remaining below 0.05 (one-tailed tests).

¹³ To compare the fit of two (or more) fractional polynomial models, we compared the deviance (D) of the two. The deviance is defined as -2 times its minimized log likelihood, using the formula $D =$

Note: All estimates were generated using Stata 5.0. Reported standard errors are robust standard errors. Data are available currently from the authors at <http://www.yale.edu/plsc151a/initiation.zip>. Model 6 includes only core dyads. * $p < .05$, ** $p < .01$, *** $p < .001$. All tests are one-tailed.

curvilinear selection effect described in Hypothesis 3a over the monotonic selection effect described in Hypothesis 3. We limit the remainder of our discussion to the estimates for model 5, which tests all hypotheses except Hypothesis 8, which we discuss below.

As shown in model 5, the coefficient estimate for initiation is statistically significant, indicating that Hy-

pothesis 1 (initiators win more often) is supported. The coefficient estimates for the two Politics*Initiation interaction terms are also statistically significant.¹⁴ This provides support for hypotheses 3 and 3a—democratic initiators win more often, and dictatorships are more likely to win than anocracies (we discuss the meaning and the interpretation of the signs and magnitudes of the interaction terms below). This is an interesting result; the conventional belief in the rational choice literature that initiators are more likely to win wars

$n \left(1 + \log \frac{2\pi RSS}{n} \right)$, where n is the sample size and RSS is the residual sum of squares estimated fitting a linear model. The gain (G) is defined as the deviance estimated for a straight-line model minus the deviance estimated for the fractional polynomial model. The test statistic to calculate the p -value for the gain for the polynomial probit model is obtained using the formula $T = D_{k-1} - D_k$. We then compared T to the χ^2 distribution with 2 df. These p -values are approximate and conservative (for an extensive discussion of fractional polynomial models, see Royston and Altman 1994).

¹⁴ In model 5, the constant's standard error is larger than the parameter estimate. When we suppress the constant, in the resulting model the other parameter estimates are stable, but the standard errors shrink substantially. In this model (not shown) the Politics*Initiation terms are significant at the $p < .001$, the Politics*Target and Initiation terms at $p < .005$. We used these more precise estimates for the deviance test outlined in footnote 13.

receives confirmation. But, even when we control for the general increase in the likelihood of victory for all initiators, some initiators do better than others. Democracies tend to have a higher likelihood of winning than all other kinds of regimes.

Among the control variables, the findings are mixed. The probit models in Table 2 are restricted models. They reflect our decision to drop two independent variables from models not presented in Table 2; one (military personnel) initially was included because Lake did so, and the other (distance) was included to test Hypothesis 8. The p -values for these variables fall far outside the standard levels of statistical significance. In addition, a likelihood ratio test indicated that we can safely exclude these two variables from the model. When including distance and military personnel, the results are consistent with models 4 and 5.

We find statistically significant relationships between winning and a better ratio of military-industrial capabilities and greater allied contributions, which supports hypotheses 4 and 5. The results for Hypothesis 9 (superior troops and training contribute to victory) are mixed. We leave it to future research using more sophisticated measures of technology and training to sort out this issue. Distance was not significantly related to outcomes, so we can reject Hypothesis 8.¹⁵ The strategy dummy variables are statistically significant, indicating that strategy choices do have systematic effects on outcomes. In addition, both the terrain and strategy-terrain interaction are statistically significant ($p < .001$). Strategy dummy variables 2 and 3, while having essentially the same coefficients, still predict different outcomes because of the effects of the strategy-terrain interaction. Hence, we find strong support for hypotheses 6 and 7.

One possible objection is that our results are biased by the inclusion of war participants other than the core dyad of belligerents (see footnote 7). To be sure that our results are robust, we also estimated model 6, which includes all the variables from model 5 but on a smaller sample, that is, the core dyad in each war ($n = 168$ versus $n = 197$).¹⁶ In this model, the results do not change substantially.

The issue of substantive explanatory power remains: How much of an effect do the statistically significant

FIGURE 1. Probability of Victory by Level of "Politics" among Target States

variables have on the dependent variable? We use figures to portray the effects of politics on the dependent variable.

In Figure 1, we demonstrate, *ceteris paribus*, the substantive effect of changing levels of democracy on war outcomes for targets.¹⁷ Note that the darkest area, which represents the potential gains from democracy compared to the null, shows a positive but small effect. When we compare dictatorships to highly democratic states (the lightly shaded area), the apparent effect is quite large. Recall that there are several explanations of this effect, most notably Lake's (1992) rent-seeking theory and the legitimacy argument. Note that we still observe effects for democratic targets even when we control for industrial capability and alliance contributions, two factors emphasized by Lake's rents argument. Indirectly, then, these findings point toward the legitimacy argument made by Lake (1992) and Stam (1996) as the most likely explanation, in concurrence with the empirical findings of Reiter and Stam (1998). What of the selection-effects argument?

Figure 2 represents the changes in the expected chance of victory for an initiating state as its politics score varies from -10 to +10.¹⁸ Here we see that the selection effect has substantive as well as statistical significance.¹⁹ States appear to become increasingly

¹⁵ We also checked for the possibility that the distance term would have an effect only as an interactive variable with military and industrial capability. This hypothesis was not supported. We also estimated a model using capability scores adjusted for distance according to the procedures in Bueno de Mesquita (1981); again, the hypothesis was not supported.

¹⁶ To estimate the core dyad model we reran our basic model, but with certain exclusions: Austro-Sardinian War (Tuscany and Modena); Roman Republic (France); Crimean (France, Great Britain, and Italy); Italian Unification (France); Lopez (Argentina); Seven Weeks (Hanover); Franco-Prussian (Baden, Bavaria, and Wurtemberg); Pacific (Bolivia); Second Balkan (Romania and Turkey); World War II in Western Europe (Italy and United States); Yom Kippur II (Jordan and Saudi Arabia); Ethiopia-Somalia (Cuba); World War Ib (Turkey); and World War Ic (Austria, Bulgaria, Great Britain, Greece, Italy, Rumania, Turkey, and United States). We also estimated a model, not in the table, that dropped all cases but initiators. In this case, politics was still associated with greater chances of victory (coefficient 0.044, SE 0.022, $p < 0.05$).

¹⁷ We used the parameter estimates from model 5 to estimate the predicted values for the plots. The vertical axis is the predicted probability of victory. Line A represents the null hypothesis: Democracy has no effect on outcomes. Line B represents the increase in the expected likelihood of victory as a state's Politics score rises from -10 to +10 while holding all other variables at their observed values.

¹⁸ Line A again represents the null hypothesis of no democratic selection effect. Curve B represents the expected change in a state's probability of victory (P) as the Politics*Initiation term varies from minimum to maximum. We used the parameter estimates from model 5 to estimate the outcome probabilities.

¹⁹ A simple interpretation of Table 2 might indicate that the political variables are not particularly important for a general understanding

FIGURE 2. Probability of Victory by Level of "Politics" among Initiator States

prudent, or risk averse, as they become more democratic; and the effect appears to be quite substantial. Highly democratic states appear to be quite unwilling to initiate war except under the most propitious conditions. Keep in mind that Figure 2 represents the political component of the selection-effects argument, as we have controlled for both the operational advantages of initiation and the other components of state power. Note also, at the far left of the graph, that the most autocratic states, while not doing as well as democracies, do substantially better than their slightly more moderate associates. This lends support to Snyder's argument that some totalitarian states may be able to gauge the chances for success more accurately than mixed regimes (anocracies).

Our results differ somewhat from those of Lake (1992) about democracies' war-fighting capabilities. We found that initiators who are democratic are more likely to win than all other types of states, and targets who are more democratic also tend to do better, but not for all the reasons Lake suggested. He argued that democracies should be stronger because lower rent-seeking means greater material capabilities, powerful alliances can be formed, and the society will be more supportive of the war effort. Note that our model uses separate control variables for material capability and alliances, and we find that democratic targets still fare

of war outcomes because their addition only raises the pseudo R^2 by .07 (model 3 to model 4). Two points are in order. First, the marginal effects tests illustrated in the figures are preferred, as they more precisely indicate the exact expected effects on the predictions of the dependent variable when comparing democratic targets and initiators to other belligerents. Second, R^2 and other summary statistics capture the overall or average contribution made by a particular set of independent variables in explaining the variance of the dependent variable. The vast majority of war participants are not very democratic (mean politics score = -2.6). We should not be terribly surprised that democracy makes, on average, less of a contribution to determining war outcomes than does strategy or military capability. For an extensive discussion of historical average effects versus potential influence, see Stam 1996, 197-8.

better than their autocratic counterparts. This encourages the conclusion that democracies are more likely to win because they can more effectively rally the support of society for a war effort.

One might expect that democratic initiators win because they select themselves into wars in which they have specific advantages, such as much smaller opponents and more allies. If this were true, then we would expect the Politics*Initiation term to be strongly correlated with some of the control variables. Yet, difference-of-means tests reveal no substantively or statistically significant relationships between that term and capabilities, alliance contributions, or troop quality ratios. In addition, democratic initiators do not make different strategy choices; among the sixteen in our data set, all but two used the modal strategy OADA. In contrast, Reiter and Meek (1998) found, in a random sample of all states in peace and war, that democracies are significantly more likely to choose maneuver strategies. Their finding may be the basis for providing a more fully satisfying answer to the following question: On what basis do democracies first judge a potential war to be winnable and then choose whether to initiate fighting?

CONCLUSION

This article has presented several results about the determinants of war outcomes. Examining all interstate wars from 1816 to 1982, we discovered that the nature of the relationship between regime type and war outcomes is more complex than previously believed. By using a broad sample and a comprehensive array of control variables, and by accounting for important interaction effects, we are able to offer some confirmation of the conventional wisdom that democratic states are likely to win the wars they fight. Notably, however, we discovered important interaction effects between regime type and initiation. Specifically, we found that democratic initiators are statistically and substantively more likely to win than other kinds of states. Furthermore, the empirical results indicate that the effect is not monotonic among initiators: Democracies are most likely to win, highly autocratic regimes are less likely to win, and mixed regimes (anocracies) are least likely to win. These findings add an important qualification to the conventional view that all initiators have an advantage, as it appears that the degree of advantage varies with regime type. We also found that democratic targets are more likely to win than other targets, though this finding has more limited statistical and substantive significance. It appears that the tendency for democratic targets to win wars is most likely due to the greater legitimacy of the regime rather than to lower rent-seeking or bandwagoning by democratic allies.

These results have important implications for broader theoretical issues. The finding that democratic initiators are more likely to win is strong circumstantial evidence of their concern about how foreign policy outcomes will affect domestic political fortunes. The finding that they almost never lose the wars they start is evidence for the theoretical expectation that demo-

cratic governments wish to avoid foreign policy failures. These results fit nicely with Siverson's (1995) finding that democratic initiators suffer fewer war casualties, which suggests they start wars that they are likely to win with little bloodshed. The alert reader will recall that we laid out two theoretical explanations for the selection effect, only one of which was related to domestic political vulnerability. It is possible that democratic initiators win because their policies are based on better information, and we leave it to future research to explore this issue.

Our findings also have important ramifications for the debate on the origins of the democratic peace. There are two principal explanations of the democratic peace: The normative explanation argues that peaceful means of conflict resolution in domestic affairs drive a peaceful foreign policy, whereas the structural explanation maintains that democratic political institutions such as elections restrain militarist adventures (Russett 1993). Our results are consistent with the latter, as they support the view that democratic leaders are willing to take military action if they are confident it will not threaten their domestic political fortunes. Our findings are not consistent with the normative position that democracies intrinsically prefer a nonviolent foreign policy, as the data reveal they will launch wars under the right conditions.

Finally, the implications for realism are mixed. On the one hand, a number of factors that realists hypothesize to be related to outcomes (in particular, allies, military capabilities, and strategy) apparently do have a strong influence. On the other hand, realism simply cannot explain the powerful relationship between democracy and successful war outcomes. If it were the case that democracies simply fought better, then the explanation could be fit into realism by recognizing that institutional democracy is a component of state power, the key focus of realism. The findings, however, indicate that differences in outcomes are not merely the result of some heretofore-misunderstood power differential. Rather, they are the result of certain characteristics peculiar to democracy itself. These may include differences in decision making and/or vulnerability to public opinion, factors which realists are loath to acknowledge. The relationship among regime type, decisions to initiate, and war outcomes indicates that domestic political structure is an aspect that scholars should not omit from the analysis of international relations.

Our findings present three new empirical puzzles for future research. First, exactly what material or strategic advantage makes democratic initiators more likely to win? Reiter and Meek (1998) suggest that democracies choose maneuver strategies, but more study is needed. Second, why do democracies only initiate wars they will go on to win? Do democratic leaders fear being punished at the polls, or do democracies create better marketplaces of ideas? Third, why do democratic targets not perform even better? Since democracies do not fight one another, they are the targets of a group less likely to win (nondemocratic initiators) than the group that confronts nondemocratic targets (a mix of

democratic and nondemocratic initiators). Continuing theoretical and empirical research can broaden our understanding of these and other issues.

Explaining Divided U.S. Senate Delegations, 1788–1996: A Realignment Approach

THOMAS L. BRUNELL and BERNARD GROFMAN

University of California, Irvine

We maintain that the rise and fall in the number of states with divided Senate delegations can be explained primarily in terms of long-run forces of realignment/dealignment and staggered Senate elections. We test our model with election data from 1788–1996 rather than only the post–World War II period, which was common in previous research. We show that a large number of divided Senate delegations is not new; indeed, the highest percentage occurred in 1830. Exactly as predicted by our model, we find a cyclical pattern in divided Senate delegations that is tied to realigning epochs. Our analysis also calls attention to the recent decline in the number of such delegations, and we argue that this trend may well continue.

Divided government has become one of the most studied topics in political science in recent years, and it has even been suggested as an organizing principle of American politics research (Fiorina 1992, 3). Since World War II, from the state to the federal level, both parties have shared the channels of power the majority of the time (see, e.g., Fiorina 1992). In this article one particular aspect of divided government is closely examined—split Senate delegations, that is, states with two senators from different parties. An increase in their number after World War II has been observed. Perhaps the most widely known explanation for why split Senate delegations occur and for which types of voters are most likely to split their ticket in voting for senators is the policy balancing model of Fiorina (1992). Exposed and tested in Alesina, Fiorina, and Rosenthal (1991), it was further refined by Alesina and Rosenthal (1995). Fiorina (1992, 80–5) hypothesizes that sending a split Senate delegation to Washington may very well be a rational decision by some voters, namely, those (presumably moderate voters) whose policy position is closer to $(D + R)/2$ than to either $(D + D)/2$ or $(R + R)/2$. This dynamic creates what Fiorina calls an “in-party disadvantage.”

While our focus is on our own model of realignment effects, rather than on critiquing/testing other explanations, whatever may be the power of the policy balancing model in accounting for House/president split voting patterns, we are skeptical of its underlying logic as applied to Senate delegations. That is, we doubt that moderate voters balance off senators from their state to arrive at a “ticket” closest to their own policy midpoint (see, e.g., Fiorina 1992, 82–5). If it is assumed that voters are concerned with policy outcomes and choose

a ticket accordingly, then what should concern them is the potential effect of their vote on control of Congress or on the partisan differences between Congress and the president, as in the Fiorina (1992) attempt to account for divided government (president versus Congress) in terms of policy balancing. If, for example, the president is a Democrat and one senator is a Republican, then, given the limited influence of any single senator on policy, a moderate voter who wishes to shift policies more toward the center still may have more reason to vote for a second Republican senator than to vote to seek to create a divided Senate delegation. In the logic of the policy balancing model, it seems to us to make no sense to consider the two senatorial seats without considering the overall political context, including which party controls the presidency. We should note that this article does *not* directly test or refute the policy balancing model. We are explaining the rise and fall of mixed delegations at the aggregate level.¹

Segura and Nicholson (1995) tested Fiorina’s strategic choice hypothesis and found little support for it. They propose and test a model to account for differences in senatorial outcomes within a given state that uses such independent variables as candidate quality and campaign spending, along with controls for position of the election in the presidential electoral cycle. They found that the level of challenger finances has a significant effect on the ability of the challenger to unseat the incumbent. They also found that senators facing a stiff primary challenger are more likely to lose in the general election (Segura and Nicholson 1995, 99). Segura and Nicholson (1995) also link the increase in split Senate delegations to the recent rise in candidate-centered politics (Wattenberg 1991), to the increase in the number of voters who consider themselves independents (Wattenberg 1994), and to the growing ability of incumbents to insulate themselves from national electoral tides (Cox and Katz 1996;

Thomas L. Brunell recently completed his Ph.D. and is a lecturer and Bernard Grofman is a Professor, Department of Politics and Society, School of Social Sciences, University of California, Irvine, CA 92697.

An earlier version of this paper was delivered at the annual meeting of the American Political Science Association in San Francisco, August 29–September 1, 1996. This article is an adaptation of a chapter from the first author’s dissertation (Brunell 1997), and the data are available from him upon request. We would like to thank Russell Dalton, William Koetzle, David Mayhew, Barbara Sinclair, and Martin Wattenberg for their helpful comments.

¹ In related unpublished research, however, we do provide an alternative explanation for why one state may be more likely to elect two opposing senators than another state. We suggest that the state’s primary type (i.e., open versus closed) has a significant effect on the likelihood of electing a mixed Senate delegation as well as on the general ideological similarity of a state’s Senate representation (Grofman and Brunell 1997).

Gelman and King 1990; King and Gelman 1991; Mayhew 1974). They argue that split delegations can be explained by factors specific to the individual Senate contests, without the need to posit an in-party disadvantage.

Previous research also has attempted to account for which states can be expected to have split representation in the Senate. One explanation for divided government is the so-called two constituencies thesis, that is, the notion that some states are sharply polarized, with senators of opposite parties drawing their principal support from two different and generally opposing constituencies of roughly comparable size; the potential for senators of opposite parties being elected in successive elections comes as a result of shifts among the remaining voters. Jung, Kenny, and Lott (1994) found strong support for this thesis. In related work, Bullock and Brady (1983) found evidence that the less homogeneous a state, the more likely it is to elect a split Senate delegation.

One consistency among the research on divided Senate delegations is that no analysis has been done on elections prior to 1940. In reading the literature, one might think that a high number of split Senate delegations is strictly a post–World War II phenomenon. Yet, the percentage of states simultaneously represented by a senator from each of the two major parties has varied greatly over time since the founding of this country, and very high levels of split Senate delegations are found in earlier political eras.

Moreover, most of the models proposed to account for patterns of divided government simply do not apply to the period before passage of the 17th Amendment. It was ratified in 1913 and required that senators be popularly elected rather than chosen by the state legislature. Given the nature of mass politics in America today—many people express no strong partisan identification, elections are largely candidate centered, and turnout rates vary tremendously between on-year and off-year elections—there is good reason to expect that the likelihood of consistent partisan Senate elections should decrease, *ceteris paribus*.

THE REALIGNMENT MODEL

Our explanation looks to long-run factors and applies to both before and after 1913. Our analysis of data going back to the first Congress will show that the rise and fall in the number of split Senate delegations can be attributed in large part to periods of realignment in American politics.² Yet, our data analysis also contrib-

utes to analysis of contemporary trends. While authors such as Fiorina (1992, 42) focus on why there has been a general increase in the number of split delegations compared to earlier decades after World War II, our analysis calls attention to an important phenomenon that seems unnoticed, namely, that divided Senate delegations have been *decreasing since 1978*. Indeed, we argue that this trend is likely to continue in 1998, although it is unlikely we will ever return to the low number of divided Senate delegations observed in previous eras.

Our argument is quite simple. A realignment can be thought of as a sustained and durable change in the partisanship and voting behavior of the electorate overall.³ But, given the staggered election cycle of senators, any radical transformation of the upper chamber is simply not possible in any *single* election. Unlike the House of Representatives, in which every member must face reelection every two years, senators are elected to six-year terms, and no two senators from the same state face the electorate the same year (barring a resignation or death).

A realignment is a multistage process. First, the number of divided Senate delegations increases as the party in whose direction the realignment is moving makes gains in states previously under the unified control of the opposition. Second, the number of unified delegations grows as the realignment eventually sweeps away incumbents of the opposite party and/or finally captures the second Senate seat in the state when it becomes open. Third, as the force of realignment becomes exhausted, idiosyncratic factors and short-run forces regain importance, and there is the slow building of momentum toward a new realignment. Once again, the number of divided Senate delegations rises, with a new inflection point (local maximum) occurring at (or near) the next critical realigning election. Over the course of each realignment era, there should be a clear cyclic shift in the extent to which Senate delegations are unified.

This process occurs relatively slowly. Even when the realigning trend is strong, unseating a well-known senator is not easy. Today, for example, one must raise millions of dollars and generate extensive media coverage and interest before a serious challenge can be mounted (see, e.g., Jacobson and Kernell 1983, 44). Thus, some time elapses before the full ramifications of a realignment are realized in the upper chamber of Congress in the form of unified party control of state delegations.

Table 1 presents an idealized version of the dynamic we propose. A hypothetical realignment is taking place over six states, each with two senators with differing election classes. The Republicans initially control a majority of the seats. As Democratic support grows, the percentage of split states rises. Then, as the remain-

for multiple levels of analysis and for care about exactly what question we are trying to answer.

³ While we do not discount the importance of approaching realignments in terms of critical elections, we prefer to think of them as multiple-election phenomena involving a clear direction of change rather than as a single critical election (see Burnham 1970).

² In terms of the debate about whether divided government should replace realignments as the organizing principle of American politics research (Fiorina 1992, 3), we argue that divided government cannot be understood except in the context of realignment, and that this is true for the contemporary period as well as for earlier periods. Of course, the fact that there are long-term trends in the number of split delegations does not mean that outcomes in individual Senate contests cannot be modeled primarily in terms of factors specific to those elections, as was done by Segura and Nicholson (1995), nor does the existence of long-term trends vitiate the accuracy of the Bullock and Brady (1983) findings about which states were most likely to have split delegations. We must always remember the need

ing senator from these states comes up for reelection, there is a reunification of the senators, only this time with two members of the opposite party.

Because our model emphasizes the cyclic nature of split Senate delegations, it suggests that what goes up will come down. In the next section we provide strong historical evidence that cyclical patterns exist, with critical inflection points in the number of divided Senate delegations corresponding to critical (realignment) elections. Moreover, the evidence suggests that 1980 was a critical election in the South, the culmination of more than fifty years of declining Democratic hegemony and a critical point in what we propose should be called "glacial, top-down" realignment in the South.⁴

⁴ The realignment is "glacial" in that only now are the remnants of the Civil War realignment waning in the South, and no one "critical election" can define the change. The change is "top-down" insofar as we agree with Aistrup (1996, particularly chapter 9) that the pattern of Republican success in the South begins with the highest office (the presidency), moves downward to Senate and House elections, and then to state and local elections.

We emphasize that the classification of 1980 in realignment terms is not crucial for our more general argument about the importance of cyclical trends in the number of split Senate delegations.

DATA ANALYSIS

Longitudinal Patterns in the Percentage of Split Senate Delegations

To understand why and when split Senate delegations occur, we look at the makeup of the Senate by state for all 105 Congresses from 1788–1996.⁵ Figure 1 is a time series depicting the percentage of states with split Senate delegations from 1788 to 1996. It shows that divided delegations are not a new phenomenon in the United States. Contrary to our expectations before examining the data, even when state legislatures were electing senators, divided delegations were common.⁶ While the percentage of states with split Senate delegations was at an extremely high mark in 1778, it was not the highest in history. The all-time high was 60% of states in 1830.⁷

Regional and Temporal Variations in the Percentage of Split Senate Delegations

There are interesting differences in the pattern of split Senate delegations not only over time but also among regions. Table 2 shows some clear long-run differences among the West, Midwest, South, and Northeast.

Two particular details are evident from Table 2. First, beginning early in this century, there is a long-run generally upward trend in the percentage of divided delegations as compared to earlier periods. In 1906, the percentage was at an all-time low—only 4% of states had a nonunified Senate delegation. From 1906 to 1924 the trend increased nearly monotonically each year (refer to Figure 1). After that, the overall proportion never falls below 20%. One plausible explanation for this pattern is ratification of the 17th Amendment in 1913, which changed how senators are elected. Indeed, we find that the percentage of divided delegations is negatively correlated with year for the period 1788–1912 ($r = \text{minus } .32, p < .01$) but positively correlated with year from 1914 to 1996 ($r = .70, p < .01$). The second detail is that the South has experienced by far

⁵ These data were gathered from *Congressional Quarterly's Guide to U.S. Elections*, 3d ed. (1994), supplemented with data on the 104th and 105th Congress.

⁶ Obviously, if a state legislature remained in the same hands, then two senators from the same party could be expected. Yet, legislative choices were not always this straightforward. For example, some legislatures were so deadlocked as to whom the next senator should be that they left the seat vacant. Between 1891 and 1905, this occurred no less than fourteen times, including California 1899; Delaware 1895, 1899, both seats in 1901 and 1905; Kentucky 1896; Louisiana 1892; Montana 1893; Oregon 1897; Utah 1899; Washington 1893; and Wyoming 1893 (Haynes 1960, 92). On at least two occasions, states controlled by one party elected a senator from the other party. In 1893, Kansas and North Dakota, both dominated by the Republicans, sent Democrats to the Senate (although, at the time, party lines in both states were "badly blurred"; see Haynes 1960, 92).

⁷ A divided delegation has two senators from different parties—any two parties. While we are very confident about partisan identification of members in the modern era, there are inconsistencies among reference books regarding the "true" party of members of Congress in the early periods of the Republic. We use the partisan identification from *Congressional Quarterly* (1994).

FIGURE 1. Divided Senate Delegations, 1788–1996

Note: A divided Senate delegation has senators from different parties.

the lowest amount of split delegations compared to the other three regions, which comes as no surprise given the Democratic domination there. The West has had the highest incidence of divided representation in the Senate.

TABLE 2. Split Senate Delegations: Regional and Longitudinal Differences

Region	Average Percentage
West	38.9
Midwest	28.2
South	15.4
Northeast	29.5
Period	
1788–1828	23.4
1830–70	26.3
1872–1912	18.2
1914–54	26.5
1956–96	40.2
Overall	28.0

Note: Average percentage is the number of states with nonunified Senate delegations among the total number of states in that region or time period. *West*: Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, North Dakota, Oregon, South Dakota, Utah, Washington, and Wyoming. *Midwest*: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, Ohio, Oklahoma, and Wisconsin. *South*: Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina, Texas, and Virginia. *Northeast*: Connecticut, Delaware, Kentucky, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Tennessee, Vermont, and West Virginia.

Realignment Periods in U.S. Electoral History and Trend Directions

Another very important point can be teased out of Figure 1. The upward and downward movement in the percentage of divided Senate delegations exhibits a greater number of runs (i.e., continuously upward or downward movement) than would be expected by chance from a normal distribution with the same mean and variance.⁸ As we shall see, these runs can be linked to realigning periods.

The standard analyses of U.S. party systems posit five historical epochs (Key 1955; Sundquist 1983). (1) The first party system ended in 1828–32 with the victory of Jacksonian democracy. (2) The second party system lasted until 1858–60 and the coming of the Civil War. (3) The third party system lasted from the end of the Civil War to the election of 1896, in which the power of western mining and agrarian interests in the Democratic Party strengthened, but the Republican Party remained dominant. (4) The fourth party system, also a period of Republican strength, lasted from 1896 until 1932 and the rise of the New Deal coalition. (5) The fifth party system, forged by Franklin D. Roosevelt and the Republican opposition to his policies, arguably persists. Many scholars claim that a long period of

⁸ With a mean of .27 and a standard deviation of .11, our random simulation exhibited no runs of length greater than 4 and only one run of that length. In contrast, the actual data have two runs of length 4, three runs of length 5, and one run of length 6.

FIGURE 2. Democratic Tide Moving Average

Note: The graph is a three-election moving average of the percentage of Senate elections won by the Democrats. Every point then is the percentage of elections in which the Democrats win for that year averaged with the same data for the two prior elections.

dealignment began in 1964 or so, perhaps even earlier. Our analyses will bear on this controversy.

Realignment-Related Historical Inflection Points

For present purposes, there are two important aspects of Figure 1. One is the cyclical nature of change in the number of divided Senate delegations that it reveals. The other is that, even though the key long-term patterns are somewhat obscured by features of the data not directly related to realignments (e.g., women's suffrage in 1920), with a little care one can discern the starting date of the five realignments as inflection points in the data. That is, divided delegations peak around the same time that a major realignment brings about massive transformations of the American electorate (1830, 1858, 1896, and 1932) and at the beginning of the first era of American electoral politics (1790).

The first period of interest is around 1828. The percentage of mixed Senate delegations rises from a low of .083 in 1820, peaks at .625 in 1830, and returns to a low of .192 in 1838. During this realignment we see states deunifying their delegation as they elect one Democratic senator; only later do they reunify their delegation with two Democrats.

Next, during the Civil War realignment around 1860, we see a rise in split delegations beginning in the late

1840s, with the number increasing throughout the next decade until it peaks in 1862. It then begins to fall as more and more states reunify their senators, only this time it is the Republicans in control. To establish that the partisanship is moving in the hypothesized direction, we plot the Democratic tide in Figure 2, which is the percentage of the Senate controlled by the Democrats since the beginning of the modern party system in 1860. Thus, around 1860 and shortly thereafter, we expect a low percentage of Democrats to be in office, and this expectation is met. The number of Democrats falls from 1860 until the early 1870s, when it reaches a local minimum.

There is another local peak in the number of divided Senate delegations, shown in Figure 1 for 1896, as the Republicans reassert their electoral dominance over the Democrats. Again, we would expect the Democrats to do very poorly in Senate elections near the realignment of 1896. In 1894 the Democrats held a majority of the seats in the Senate, but in 1896 and continuing until 1906 the Republicans regained control of the Senate, and the Democratic tide ebbed.

Figure 1 also shows mixed delegations rising before the 1930s, peaking in 1932, and then receding for most of the elections shortly thereafter. Yet, the local maximum around the New Deal realignment occurred in the early 1920s. While we cannot explain with certainty why this peak occurred then, one possible reason is the

introduction of women into the electorate.⁹ The direction of partisan change in Senate elections given in Figure 2 and with the pattern of divided delegations in Figure 1 support our theory about divided delegations and partisan realignments.

While our model rests on a shift in electoral outcomes from one party to another, we are not saying that partisan realignments (past or present) are strictly unidirectional. Indeed, much of the literature has argued that these shifts, while massive, are still local affairs. Nardulli (1995, 10) states "that critical realignments are subnational phenomena that vary considerably in form, [and] not the majestic national movements some believed them to be." Nardulli also finds that only the realignment in 1932 involved more than half the country. Clubb, Flanigan, and Zingale (1980) also argue that the New Deal shift was atypical in that it involved more of the nation than previous realignments. Thus, while we posit a clear shift from one party to the other, we do not expect one party to win all Senate elections in any particular year; indeed, we know this is not the case.

A Multivariate Model of Divided Senate Delegations

We offer in Table 3 a model to explain the cyclical variance in split Senate delegations from 1788 to 1996. The dependent variable is the percentage of divided Senate delegations in all states.¹⁰ We model results in terms of the following.

1. A four-year lag ($t - 4$) on the dependent variable. This lag is not contaminated by those states whose status as unified or divided has not yet had an

⁹ The 19th Amendment was ratified in 1920. For a discussion of its effect, see Brown (1991, chapter 6). Figure 2 indicates a revival of Republican strength in Senate elections during this time.

¹⁰ Since we use the percentage of states with divided representation each year as the dependent variable, we cannot use a two-year lag. Since Senate elections are staggered, one-third of the states exhibit no electorally based change in representation from $t - 2$ to t . By using a two-year lag, we would in part be using the dependent variable to explain itself.

opportunity to change. Over a four-year period, at least one seat in each of the 50 states experiences a new Senate election.

2. A ($t - 2$) - ($t - 8$) lagged difference on the dependent variable to pick up a directionality. Recall that the percentage of divided Senate delegations is predicted by our realignment approach to be consistently moving, on average, in a given direction over a series of elections. Sometimes that direction will be upward, sometimes downward, depending upon the phase of the realignment cycle.¹¹
3. Realignment-specific trend variables for each of the recognized realignment eras.¹²
4. A dummy variable to capture the putative effect of the 17th Amendment, which is coded +1 for elections after 1912 and 0 for earlier elections.

As can be seen in Table 3, the lagged terms are highly significant. Of the four realignment terms, all have the correct sign, and 1932 is the only election that is nowhere near statistically significant. Finally, as expected, the post-1912 variable is positive and statistically significant. The coefficient on this term is 6.16, which means the introduction of popular elections to the Senate added, on average, about three states (6% of 50) to the overall number of states with divided party delegations. Since there are 101 observations, an adjusted R^2 of .67 with only seven variables is a quite reasonable performance for our model.¹³

The Modern Era: The Realignment/Dealignment Controversy

Students of realignment dispute exactly what kinds of changes the American political landscape has been undergoing recently. If the pattern is a shift every 32 years or so, then there should have been a realignment long ago, certainly by the end of the 1960s. Absent any sustained change in party control at all levels of government, some political scientists began to question the utility and explanatory power of realignment theory and its application to modern American politics (see Ladd 1991). We agree with others (e.g., Burnham 1991; Nardulli 1995), however, that realignment theory still offers important insights and testable hypotheses.

If there has been a realignment since World War II,

¹¹ Because each of the three cohorts is only partly overlapping in terms of the states holding elections in any given year, even lags such as $t - 2$ and $t - 4$ are not fully autoregressive. Strictly speaking, only a $t - 6$ (or $t - 12$) lag would be fully autoregressive. We have not used those lags.

¹² Operationalizing each of the realigning period variables reported in Table 3 involves coding values of 1 for the three elections preceding a realignment, -1 for the three elections following a realignment, +2 for each critical election year, and 0 for all other years. We experimented with a variety of operationalizations and found this to be marginally best. Yet, little explained variance is lost by simply using realignment year dummy variables for peak elections (1830, 1862, 1896, 1932).

¹³ This is especially true since we are using no explanatory factors that are truly election specific, other than realignment periodization. We should note that the same model was run on the data with the southern states removed. The only difference worth noting is that the coefficient for the post-1912 variable rose to 8.21. The coefficients for all other variables were nearly the same as reported in Table 1.

it is unlike any experienced previously. While the number of people identifying themselves as Republican has increased considerably, the magnitude of this change has been too small for most authors to conclude that a partisan realignment has taken place (see, e.g., Wattenberg 1994), especially since the most dramatic recent change in party identification is the rise in the number of voters identifying themselves as independent. Nonetheless, the ratio of self-identified Democrats and Republicans has gone from about 3:2 to a more nearly even balance. Similarly, while Figure 2 shows that the general trend in Democratic electoral success in the Senate has been downward since the 1960s, the secular trend is not clear, and we would not conclude that a Republican realignment has taken place. Moreover, there has been no critical election, financial disaster, or world war to spawn the political earthquake normally associated with a realignment.

We argue below, however, that *in the South* there is evidence of a regional realignment whose contours were masked by the dramatic rise in Democratic Party loyalty among black voters in the 1960s and the growth in black enfranchisement since then (Alt 1994). Furthermore, the shift occurred from the top (i.e., the presidential level) down (see Aistrup 1996; Bullock 1988) and moved at a glacial pace.

A New Era of Realignment?

After falling in the period following the New Deal realignment, the percentage of divided Senate delegations began to rise in the early 1950s and continued to do so reasonably steadily for nearly thirty years. From Figure 1 it looks like the New Deal shift never quite culminated, since the percentage of split Senate delegations did not return to the lows reached both before and after earlier realignments. Yet, this may be due simply to a long-term shift caused by the change in the mode of electing senators. Moreover, the percentage of divided Senate delegations peaked in 1978 and then began to decrease.

This feature of the data can be regarded as purely accidental, but it suggests a possible realigning trend. In particular, the model projection shown in Table 3 for the 1998 election predicts a decrease of a few points in the percentage of divided Senate delegations, from 38% in 1996 to 33% in 1998, which equates to two or three fewer states with a mixed delegation. If this occurs, then it will be the seventh decrease in the last ten elections (one of which involved no percentage change. Thus, one important point not mentioned in the recent literature (see, e.g., Fiorina 1992; Segura and Nicholson 1995) is that the most recent trend in split Senate delegations is clearly downward.¹⁴ Nonetheless, even if the downward trend continues, a return to the previous historic lows in the number of divided

Senate delegations is unlikely, given the increased volatility in the electorate, the decline in party loyalty, and the rise in the number of independents.

Glacial, Top-Down Realignment in the South

Although the overall percentage of states with divided Senate delegations may not fall much farther, it is plausible to believe that the South is experiencing a prolonged top-down Republican realignment, despite occasional temporary reversals in the pattern in some southern states. It is primarily this development that accounts for the decline nationally in mixed Senate delegations.

Our findings are fully consistent with other research on the South. Aistrup (1996) documents a "Southern Strategy" initiated in the 1960s by the Republican Party to transform the South into a GOP stronghold through a "top-down advancement" of Republican candidates. Similarly, Bullock (1988, 562) found that "the share of GOP Senate seats in the South grew by 40 percentage points between 1960 and 1980." He also found that while the general trend in the South is toward the Republicans, there have been setbacks (such as the 1986 Senate elections), and that the general progression has been a top-down realignment.

In Figure 3 the percentage of divided Senate delegations is shown separately for the South and non-southern states. We see a clear upward tendency in the number of divided Senate delegations since 1960. Indeed, comparing the two trends, we see that much of the change has occurred in the South. Yet, we also see that this upward trend in the South may be reversing as the Democrats lose their historical strength in the region and the Republicans gradually become the dominant party. Given recent events (particularly the 1994 elections), we might expect a continuing Republican realignment in the South and thus a period in which many of these states elect two GOP senators.¹⁵ As previously noted, we consider this movement in the South glacial, since the time frame is like none of the past realignments in the American political experience.¹⁶

¹⁵ Further evidence of a slow realignment in the South comes from within-state correlations for the vote share in Senate elections. First, we ran the correlation for the Democratic percentage of the vote for the same Senate seat (Senator A's vote share in 1990 correlated with Senator A's vote share in 1996) and found that the correlations were at an all-time low ($r = .10$) for the elections of the late 1980s and early 1990s. After running a second set of correlations for the vote share between the two different senators in a state (Senator A's vote share in 1992 correlated with Senator B's vote share in 1994 or 1996), we found that in the late 1980s the correlation was negative ($r = -.4$), and only for the most recent elections was it positive. We interpret this as a slow shift from all Democrats to what eventually will be a nearly unified Republican South. Currently, only Louisiana is represented by two Democrats. This is remarkable since as late as 1960 all ten southern states were represented by unified Democratic delegations in the Senate.

¹⁶ In the patterns we observe, small to moderate gains made by one party or the other in any given election may quickly be wiped away, even in the very next election. In contrast, past partisan realignments have been portrayed as involving massive unidirectional change (see,

¹⁴ We think of this dealignment as a combination of many small events, or tremors, that are generally but far from completely moving the political landscape toward the Republican Party, with the most important evidence of long-lasting change coming from the South (see below).

FIGURE 3. Percentage of Divided Senate Delegations in Southern and Nonsouthern States

Note: Divided Senate delegations are those with senators from different parties. The South is defined as Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina, Texas, and Virginia. The break in the trend line for the southern states (1860–66) is due to the Civil War and the expulsion of senators from these states.

DISCUSSION AND ISSUES FOR FURTHER RESEARCH

Split Senate delegations are not merely a result of the modern era of divided government. There have been long-run cyclical patterns in the percentage of nonunified delegations since the beginning of the Republic, and in much earlier political eras there was a high percentage of states represented by senators of opposing parties. We argue that the rise and fall in the number of divided Senate delegations can be tied to periods of electoral realignment in American politics. As a realigning trend begins, the number of divided delegations increases and peaks in (or near) some critical election. As the realigning wave works its way through the six-year senatorial election cycle, the number of divided delegations declines, as one party begins to dominate electoral politics. Then, a new wave begins and starts the cycle all over again. We have provided convincing empirical evidence and a clear theoretical rationale for the existence of such repeated patterns.

Also, focusing on longitudinal patterns in split Senate delegations provides a new perspective on an old debate about exactly when realignments take place. The standard approach, dating back at least to Key's

(1955) classic article, is to date realignments from the critical election in which one party's dominance for the next period is established. Thus, the realignment of 1896 is followed by the realignment of 1932. But it may be even more meaningful to think about realignments not from peak to peak (e.g., 1896 to 1932), but from trough to trough (e.g., from 1846 to 1888, from 1890 to 1906, from 1908/1922 to 1950, from 1952 to ??). What has been regarded as *the* critical election becomes a high point (maximum point of inflection, or near to one) of a realigning trend, somewhere in the middle of our new definition of a realigning era.

From this perspective we see the realigning wave as being visible long before the actual critical election. This approach largely sidesteps controversy as to whether it is 1928 or 1932, 1828 or 1832, say, which should be taken as the "defining" election. It also suggests very different answers to the question of how best to periodize the changing epochs of American party politics. Yet, full resolution of this question requires us to look at a variety of other types of data on the pace of realignment across different levels of government.

Unfortunately, there are other questions for which our data (and theory) cannot yet provide a fully satisfactory answer. In particular, did a national realignment emerge in or around 1980? Here the evidence is mixed, but the probably answer is "no." If not,

e.g., Brady and Lynn 1973). Our finding is consistent with Bullock's (1988, 569) statement that "unlike realignments of the latter half of the 19th century, the changes of the last generation have been more gradual and less persistent."

is a realignment taking place, but only in the South? We believe the probable answer is "yes." Will we ever return to the previous low levels of divided Senate delegations? While definitive evidence is lacking, the answer is likely to be "no," given the fundamental change in 1913 to popular election of senators.

Our results are important to students of American politics and not just to specialists on Senate elections. First, we show the usefulness of time-series data in helping to develop less time-bound explanations. Second, our results contribute to the ongoing revitalization of realignment theory (Aistrup 1996; Bullock 1988; Burnham 1991; Nardulli 1995; cf. Ladd 1991). Third, our model predicts a future decline in the number of divided Senate delegations that flatly contradicts the established wisdom (Fiorina 1992).

Estimating the Effect of Campaign Spending on Senate Election Outcomes Using Instrumental Variables

ALAN GERBER *Yale University*

To examine the traditional view that challenger spending is more effective than incumbent spending, I reestimate the effects of spending using instrumental variables that affect a candidate's ability to raise campaign funds, such as candidate wealth levels. When the endogeneity of candidate spending levels is properly taken into account, the marginal effects of incumbent and challenger spending are roughly equal. In contrast to previous research showing that, because of higher marginal returns to challenger spending, the incumbent's spending advantage cannot explain high incumbent reelection rates, this article shows that in an average Senate election the incumbent's spending advantage yields a 6% increase in the incumbent's vote share. That incumbent spending wins elections has direct implications regarding the consequences of campaign finance reform. My findings imply that equalizing spending levels may significantly increase incumbent defeat rates, and caps on candidate spending may improve the chances of challengers.

In American congressional elections incumbents routinely win reelection. Even in the 1994 Republican landslide, change in the partisan makeup of Congress occurred mainly through open seats switching from the Democrats to the Republicans. A common explanation for high congressional reelection rates is the large campaign spending advantage enjoyed by incumbents. It is widely believed that challenger spending is very important, but there is surprisingly little evidence in the academic literature that incumbent campaign spending has an important effect on congressional election outcomes. In light of the substantial effort incumbents devote to fundraising, as well as some nagging methodological questions about existing academic studies, the effect of incumbent spending on election outcomes remains an unresolved issue.

Accurately measuring how incumbent spending leads to votes is of obvious importance. Politicians want to win elections, and so if money matters, then this will influence their behavior. If campaign spending effects are trivial, then concerns about politicians being purchased by contributions from PACs and other "special interests" are probably exaggerated. Accurate measurement of the effect of campaign spending is essential for evaluating the effects of campaign finance reforms. Finally, most of the academic literature on campaign finance has yielded a provocative finding that fuels additional investigation: For given spending levels, incumbent campaign spending appears to have much smaller marginal returns than challenger spending.

This article measures the effect of campaign spending on Senate election outcomes. I begin by briefly reviewing the academic literature. A key issue in

estimating the effect of campaign spending is that campaign spending levels respond to expectations about the closeness of the election. Most research ignores this or downplays its significance. After reviewing the existing studies, I present a model of Senate election outcomes and describe instrumental variables that can be used to estimate the effects of spending. I argue that contrary to a view often expressed (Jacobson 1985, 1990), valid instruments can be found to permit the identification of a two-stage least-squares model of the effect of campaign expenditures on election outcomes. The major innovation here is the use of a new set of instrumental variables that permits consistent estimation of the effects of candidate spending. This study employs instrumental variables which shift a candidate's cost of funds, such as candidate wealth levels. If variables such as candidate wealth levels do not have a direct influence on election outcomes, then they can be used to obtain consistent estimates of the effects of spending. Following a description of the model and data, I report the results of model estimation. Ordinary least-squares (OLS) and two-stage least-squares (TSLS) estimation of a standard model of Senate election outcomes produce very different results. OLS estimation confirms the conventional view that incumbent spending has a lower marginal effect than challenger spending, while TSLS estimation shows the marginal effects of spending by challenger and incumbent to be both statistically equivalent and substantively important. The article concludes with an examination of the implications of the findings. I consider, among other things, how my results regarding campaign spending in Senate elections relate to the more general issue of when campaign spending may be more or less effective.

REVIEW OF THE LITERATURE

Over the past two decades, there have been numerous attempts to measure the effects of spending on election outcomes. Most authors have assumed that candidate spending levels may be viewed as exogenous (among others, see Abramowitz 1988, 1991; Ansolabehere 1990; Caldeira and Patterson 1982; Giertz and Sullivan

Alan Gerber is Assistant Professor of Political Science, Yale University, New Haven, CT 06520.

This research was supported by a National Science Foundation dissertation fellowship and by the Institution for Social and Policy Studies. An earlier version of this paper was chapter 1 of my dissertation (Massachusetts Institute of Technology, 1993). I am very grateful to Steve Ansolabehere, Donald Green, Morris Fiorina, Bill Keech, Jim Poterba, Jim Snyder, and Charles Stewart for comments on the earlier version of this work. I also thank the anonymous reviewers for many very helpful suggestions.

1977; Glantz, Abramowitz, and Burkhart 1976; Grier 1989; Kenny and McBurnett 1992; Levitt 1994; Lott and Warner 1974; Shepard 1977; Silberman and Yokum 1978; Thomas 1989; Welch 1974). The canonical example of work in this literature is a regression of a candidate's vote level on some function of the candidate's spending levels and other variables relevant to the election outcome.¹ The basic differences among studies are use of alternative functional forms for converting spending into votes (linear, quadratic, and logarithmic functions are used) and analysis of different types of campaigns (the U.S. House is most common). The model specification in many of the earliest studies focuses on partisan differences and restricts the marginal effects of challenger spending and incumbent spending to be identical. When this assumption was relaxed, the central finding of this literature was uncovered: Challenger spending has much greater marginal returns than incumbent spending; the effects of the latter are small and often not statistically significant (e.g., Abramowitz 1988; Jacobson 1980, 1985, 1990). The result that challenger spending is important while incumbent spending is not has been verified consistently by OLS regressions. Jacobson (1985, 23) summarizes the findings of numerous academic studies: "The idea that the challenger's spending level is what matters for election results is repeatedly supported. Indeed, it is supported by results from almost every set of elections where the question has been tested."

The result that incumbent spending has little or no effect on the incumbent's election chances, and in some studies actually appears to reduce the incumbent's expected vote, has provoked two responses. The first is attempts to explain why these findings make sense theoretically. The second is a few attempts to improve the empirical methods to correct for possible endogeneity of campaign spending.

Gary Jacobson provides the main theoretical explanation for the relative ineffectiveness of incumbent spending. He argues that attempts by both the challenger and the incumbent to influence the voters are subject to decreasing returns. Since the incumbent begins with the built-in advantages of staff and free mailings, any spending by the incumbent is an addition to already high levels of campaign activity. What is more, even before spending the first dollar, the incumbent is well known to the voters, so any additional communication will add relatively little to their knowledge. Challengers, in contrast, are generally unknown and so benefit greatly from campaign exposure (Jacobson 1978, 1990).

Jacobson's theory, originally developed to explain differences in the effectiveness of spending by incumbents and challengers in U.S. House elections, can be applied to Senate elections to generate predictions about Senate incumbent and challenger spending effects. First, roughly speaking, Senate incumbents are at least as well known as House incumbents, so we should expect incumbent spending to have minimal effect.

Second, since the level of voter knowledge of Senate incumbents is greater than the level of voter knowledge of Senate challengers, we would expect incumbent spending to be less effective than challenger spending. These expectations are in fact confirmed by existing work on Senate elections (Abramowitz 1988; Jacobson 1985).

Jacobson's explanation for observed differences in the effectiveness of spending is straightforward and appealing, but there are grounds for skepticism. First, while senators are relatively well known, they have the opportunity to spend money to address new issues or concerns, some of which may not have arisen in previous years. Second, campaigning not only informs the voters about oneself but also brings to light damning information about one's opponent. When the voters do not know much about the challenger, this gives the incumbent a great opportunity to use money to "define" the challenger.

In theory, incumbent spending may be *more* effective than challenger spending. Incumbents typically have advantages in organization and expertise that make their expenditures more efficient and therefore more effective dollar for dollar than those of challengers. If this is an important consideration, then the marginal effect of spending by the incumbent may be *greater* than the marginal effect of challenger spending. A final reason for skepticism is that the actual behavior of incumbents, who are political professionals, appears to contradict the premise that incumbent campaign spending has little effect. If incumbents are sensible, then it is hard to explain their substantial fundraising efforts.²

It is possible that Jacobson has constructed an ingenious theoretical explanation for a nonexistent fact. The true effects of spending may be mismeasured due to methodological problems that result when spending levels are treated as exogenous variables. There are a number of reasons to suspect that regressions which assume spending is exogenous yield biased coefficients. Some reasons to expect that spending levels are influenced by electoral conditions include: (1) As the probability of victory rises, it is easier for a candidate to raise money; (2) if the election looks close, supporters are more likely to contribute to the candidates; and (3) if the incumbent becomes sure of victory, the incumbent scales back fundraising activity. For these reasons and others, if there are factors influencing the election outcome that are not captured in a single-equation regression model, then the effects of spending on election outcomes will be biased due to correlation between the spending levels and the regression error.³

¹ For an analysis using survey evidence, see Kenny and McBurnett (1992).

² This common argument can be refuted if it is believed that the marginal cost of raising funds for the incumbent is very low, since the large amounts of money raised can be easily reconciled with low marginal benefits. Anecdotal evidence suggests otherwise; politicians find raising money distasteful and time consuming. Consider the view of Hubert Humphrey, who called raising funds "a disgusting, degrading, demeaning experience" (Jacobson 1978, 475).

³ For a game theoretic model showing formally how omitted explanatory variables will lead to biased estimation, as well as how variables

Most of the empirical literature ignores or dismisses the issue of the endogeneity of spending levels, although several studies attempt to correct for possible biases. Attention has been focused on elections to the U.S. House. As part of his seminal work estimating the effects of campaign expenditures, Jacobson (1978) attempted to estimate a TSLS model of spending in House elections.⁴ A recent paper estimating the effects of campaign spending using an instrumental variables approach is an important study of U.S. House elections by Green and Krasno (1988).⁵ Their work has heightened debate, as the results call into question the conventional view that incumbent spending is less important than challenger spending.

Green and Krasno show that, in contrast to the usual OLS findings, incumbent spending effects are statistically significant and roughly equal to challenger spending effects. This is a welcome finding for those who suspect that incumbent spending is important, but several methodological questions have been raised regarding their study.⁶ Most important, because of a lack of instrumental variables, they assume that challenger spending is exogenous, and only incumbent spending is endogenous. If this assumption is false, then inconsistent estimates of both challenger and incumbent spending effects will result.

Nearly all the research on Senate elections relies on OLS regressions.⁷ Jacobson (1985) analyzes six years of Senate elections, presenting regression results separately for each year. He finds that challenger spending has strong and statistically significant effects on candidate vote totals, while incumbent spending effects are smaller and rarely statistically significant. Abramowitz (1988) estimates a model of Senate elections which includes many explanatory variables omitted from Jacobson's regressions and pools the results of seven years of Senate elections. Like Jacobson, he finds that challenger spending has strong and statistically signif-

icant effects. He shows that while incumbent spending is significant at the .05 level, the marginal effect of challenger spending is approximately three times that of incumbent spending.⁸

This article reestimates the effect of campaign spending on Senate election outcomes and extends the literature in several ways. First, it improves upon some of the best existing work by treating both challenger and incumbent spending as endogenous. Second, it employs a new set of instrumental variables. Estimation will focus on variables, such as candidate wealth levels, that make raising campaign funds easier or harder for the candidate. These instrumental variables avoid some of the problems that called earlier work into question. In addition, this study attempts to ensure the accuracy of the regression results by performing formal statistical tests of the assumptions underlying the instrumental variable regressions, as well as by undertaking several different regressions to establish the robustness of the findings.

DATA AND METHODS

In the following two subsections, I first present a model of Senate election outcomes and describe the data. I then discuss the instrumental variables used to estimate the model.

Election Outcome Model and Data

Data were collected for all Senate elections occurring in 1974 through 1992. After eliminating open seats and elections for which there were missing variables, 229 elections remained.⁹ The model estimated had the basic form:

$$\begin{aligned} \text{Incumbent Vote \%} = & \alpha + \beta_1 \log(\text{Spend}_c) \\ & + \beta_2 \log(\text{Spend}_i) + \beta_3 Z + E, \end{aligned}$$

where Spend_c is *Challenger Spending*; Spend_i is *Incumbent Spending*; Z is a vector of variables capturing political conditions, economic conditions, and other factors thought to be important to the Senate election outcome; B_3 is a vector of coefficients; and E is an error term.

In all regressions, the variable on the left-hand side is the incumbent's percentage of the two-party vote (*Incumbent Vote Share*). In addition to candidate spending levels, a number of variables are included on the right-hand side. These measure the effects of challenger quality and partisan, ideological, and economic conditions on the incumbent's percentage of the

that affect a candidate's "cost of campaign funds" function can be used as instrumental variables, see Gerber (1993). Due to the various ways spending levels may be influenced by expectations regarding the election, it is not possible to predict the bias in OLS regression coefficients. A downward bias in the incumbent spending coefficients can easily follow if incumbents vary their fundraising intensity according to whether their reelection appears safe.

⁴ This study can be criticized on the grounds that the excluded variables, such as the challenger's political party, and the strength of the challenger's political party in the district, are not excludable from a regression of candidate vote percent on spending levels. Jacobson has conceded that this is a problem (Jacobson 1985, 32). In 1985, Jacobson updates his 1978 work using a similar methodology.

⁵ See also Kenny and McBurnett (1994).

⁶ For a discussion, see Jacobson (1990) and Abramowitz (1991).

⁷ I am aware of two attempts in the literature to estimate a two-stage model of Senate election outcomes. Jacobson (1978) performs the regressions described in footnote 4 for House elections using Senate election data. Stewart (1989) also estimates a model of Senate election outcomes. In his study, variables relating to the quality of the challenger, state ideological orientation, and special conditions regarding the incumbent, such as scandal or poor health, are omitted from the election prediction model to permit estimation of spending effects. The use of omitted variables such as those listed above as instrumental variables is inappropriate because they have demonstrated explanatory value in the election prediction model and therefore will be correlated with the error in the regression explaining the Senate election outcome.

⁸ For another OLS analysis of Senate elections, see Grier (1989), who uses a functional form for spending effects different from that of Abramowitz and Jacobson. Grier's findings are similar to those of Abramowitz. Grier concludes that the net effect of spending in Senate elections (1978–84) was to increase challenger vote shares by around 3%.

⁹ The measure of ideological distance of the incumbent from the ideological outlook of the state and the partisan makeup of the state's electorate were not available for Alaska or Hawaii, so these states were excluded from analysis.

vote. This model format is familiar in the literature. The remainder of this section briefly discusses the variables.

To capture the influence of economic conditions on the election outcome, the variables used were *State Unemployment Levels* in the election year and state unemployment levels in the election year interacted with a dummy variable that is coded as one when the incumbent was from the same party as the president (*State Employment Level * Incumbent in Governing Party*). It was expected that bad local economic conditions would help all challengers, and it would help them more if they were not from the president's party.

To measure challenger quality, the level of political experience was used.¹⁰ Challengers were divided into five groups according to whether they had been (1) a state Governor, (2) a U.S. Representative, (3) a Major State or Local Official, such as attorney general or mayor of an important city, such as Pittsburgh or Indianapolis, (4) a Minor Public Official, such as member of a city council or a state legislature, or (5) held no previous elected office.¹¹

Several variables relating to state political conditions and characteristics of incumbent senators were taken from Abramowitz's study. Abramowitz based measures of a state's partisan and ideological orientation on work by Wright, Erikson, and McIver (1985), who compiled data on state-level partisan and ideological orientation from CBS News-New York Times surveys conducted between 1974 and 1982.¹² The difference in the percentage of Democrats and the percentage of Republicans in each state was used to capture partisan differences across states (*State Partisanship*). An updated version of Abramowitz's measure of the *Ideological Distance* between the voting record of incumbents and the ideological leanings of their state is also included in the model.¹³

Dummy variables were included to account for special conditions that may affect the Senate race.¹⁴ Several types of special condition were isolated. A "scandal" involves allegations of illegal activity by the incumbent (*Incumbent Scandal*). Examples are Senator

Jepson, who belonged to a "health spa" used for prostitution, and Senator Brooke, who misreported his financial worth in divorce proceedings and may have been involved in Medicaid fraud. A "controversy" is an incident that raises questions about the honesty, judgment, or competence of the incumbent (*Incumbent Controversy*). Examples are Senator Hartke's excessive foreign travel and Senator Andrews's medical malpractice suit. A "health" problem occurs when the incumbent's ability to function in office appears in question (*Incumbent Health*). Examples are senators Goldwater, Dominick, and Magnuson, all of whom had difficulty walking.

Several challengers were distinguished as "celebrities" if they were well known for some reason other than politics (*Celebrity Challenger*).¹⁵ These challengers were the astronauts Schmitt and Lousma, U.N. Representative Moynihan, Vietnam POW Thorsness, and S. I. Hayakawa, a university president made famous by a confrontation with student demonstrators.

Dummy variables were included for each party for each year in order to assess the influence of partisan tides and swings in feeling toward or away from incumbents.

The logarithm of candidate spending levels, measured in real 1974 dollars per voter, were included in the election outcome model.¹⁶ The exact form for the spending variables is natural log (real spending per voter + .01). The constant .01 was added to real spending per voter before taking the logarithm due to the fact that, for very low spending levels, the log transformation sends the value to negative infinity.¹⁷ The logarithmic functional form was selected, since it is a simple function consistent with the desirable features that candidate spending should have positive returns at all observed levels and should exhibit decreasing returns as the most critical tasks are attended to with the first expenditures.¹⁸

Instrumental Variables Used for Estimation of Spending Effects

Three instrumental variables were selected to estimate the model. The objective was to find variables likely to influence campaign spending without directly affecting the election itself. The first instrumental variable is based on a measure of *Challenger Wealth*. Richer

¹⁰ Use of political experience as a proxy for challenger quality is a common practice in the literature on congressional elections. See, for example, Bianco (1984), Born (1986), and Jacobson and Kernell (1981).

¹¹ It is possible that the challenger quality variable is endogenous, if the challenger's decision to run responds to electoral weakness of the incumbent. While this may be a problem, it may be minor for two reasons. First, candidates enter well in advance of the election, and therefore entry cannot respond to factors that develop nearer the election. Second, as Squire (1991) has argued, since Senate seats are very scarce, it is difficult to time one's run; there likely will be only a few opportunities and many potential challengers.

¹² Restricting analysis to a subsample that more closely overlaps the Wright, Erikson, and McIver survey data would not alter any conclusions of this paper.

¹³ This variable, which is calculated according to a formula based on voting record ratings by Americans for Democratic Action (ADA), Americans for Constitutional Action (ACA), and state ideological rankings based upon the survey data, is detailed in Abramowitz (1988).

¹⁴ The classification of scandal, health, and controversy is similar to that used by Abramowitz (1988), with some updating for recent events, such as the savings and loan scandal's "Keating five."

¹⁵ Westlye (1991) isolates a set of candidates for this distinction. Abramowitz (1988) also distinguishes a similar set of candidates.

¹⁶ This treatment follows Jacobson (1985) and Grier (1989), who use spending per voter in their analysis of Senate elections. Abramowitz (1988) assumes that there are economies of scale and adjusts the denominator of the spending variable.

¹⁷ The \$5,000 added to spending levels in House elections by Green and Krasno (1988) is of very similar magnitude to an addition of \$10,000 per million voters in a Senate election. Qualitatively similar TSLS results were obtained when different small constants were used.

¹⁸ Several other functional forms were analyzed as well. The major finding of the estimation—that TSLS equalizes the marginal spending effects of incumbent and challenger spending, and that the marginal spending effects for both challenger and incumbent increase substantially over the OLS coefficients when reestimated by TSLS—held for all functional forms tested.

challengers have more money to spend on their Senate race. This variable was generated by reading through the descriptions of the upcoming Senate races contained each election year in the *Congressional Quarterly* election preview issue. Challengers were categorized as wealthy or not based upon the description.

Challenger wealth was set equal to 0 if the *Congressional Quarterly* election preview listed the challenger's occupation or former occupation as, for example, a public sector job, teacher, military, or lawyer. Challenger wealth was set to 1 if the description indicated a real estate developer, an independent business owner or president of a business, a banker, a top executive, or used terms such as "wealthy," "independently wealthy," "millionaire," or "heir." Overall, challengers' contributions to their own campaign constitute about 8% of total challenger spending. This spending is concentrated in a subset of races, and those classified as wealthy account for a large portion of challenger self-financing.¹⁹ The mean level of real campaign spending per voter in 1974 dollars by a rich challenger was around 60% greater than the mean level of spending for other challengers.²⁰

The second instrumental variable was based on state voting age population (*State Population*). If holding the office of senator allows incumbents to raise a fixed sum independent of their state population, then senators from small states can raise large sums per capita, while those from populous states will have more difficulty raising the same amount per capita. The next two paragraphs discuss reasons to expect that per-capita contributions from both individuals and PACs vary inversely with state size. Empirical evidence shows that campaign spending per capita is lower in populous states.

Senators raise many individual contributions from out of state. There is no systematic accounting of the geographic origins of campaign money, but there is some evidence of its importance. The *Washington Post* found that, in the 1984 Senate elections, 16% of all individual contributors of more than \$200 were from out of state (Sorauf 1992, 47). Senators exploit this source of campaign funds: "Unlike most House incumbents, [senators] can and do raise large sums from individuals in other states. They offer much greater eminence than do House members, and some even cultivate the well-tailored, photogenic manner of celebrities. Their campaigns are the classic locus of the well-brokered reception in which the senator flies in for cocktails, smiles, handshakes, a few words, and a covey of \$1000 checks" (Sorauf 1992, 90). If the fee for an

appearance is not a function of the population of the senator's home state, then the amount raised per voter will vary inversely with state population.

In addition to out-of-state individual contributions, the amount raised from "investor PACs" (those classified by the FEC as trade, membership, and health organizations, corporations, labor unions, and cooperatives) does not increase with the population size of the senator's state (Snyder 1989, 1990). The favors a senator can deliver to an interest group are a function of the senator's political influence, and each senator gets only one vote, regardless of state size. The implication is that, in per-voter terms, a senator from a small state has much more to sell than a senator from a populous state.²¹

Population is a valid instrument if it is correlated with candidate spending levels but does not directly affect Senate election outcomes. Early regression analysis by Hibbing and Brandes (1983) suggested that population is inversely correlated with incumbent vote shares in Senate elections. More recent work by Westlye (1991) and Krasno (1994), however, vigorously contests this view. While both recognize the theoretical possibility that incumbents from smaller states may outperform incumbents from larger states, Westlye and Krasno show that there is no relationship between population and vote share, with the possible exception of the very largest states (e.g., California, New York, Texas). To confirm that my findings were not contaminated by any possible problems with using population as an instrument, I examined robustness by excluding the largest states from the sample. The results were unchanged.²²

The third instrumental variable was based on *Lagged Spending* by Senate incumbents and challengers.²³ The exact variable used was the sum of spending by the incumbent and challenger in the *previous* Senate election in the state. Due to the staggered nature of Senate elections, the previous race and the current race rarely involve the same incumbent or challenger. The variable is therefore free from the criticism that might be applied to lagged spending by the same candidate, namely, that specific candidate attributes are correlated with both the regression error and past fundraising levels. Lagged spending should be correlated with the included spending variables for the current election, however, since candidates from the same states may face similar fundraising environments.

Table 1 shows summary statistics for the variables used in the empirical analysis.

¹⁹ The FEC final reports for 1990 and 1992 show that wealthy challengers accounted for a large portion of candidate self-financing. For contested Senate races in which an incumbent ran, total unpaid loans and contributions amounted to \$11.9 million. Spending by those that *Congressional Quarterly* described as affluent or rich (12% of all candidates) was \$8.4 million. This implies that the latter accounted for about 70% of all candidate self-financing.

²⁰ In the regression results reported later, it is possible that the instrumental variable indicating challenger wealth should be divided by the state voting age population. It was found that dividing the wealth variable by state population had no significant effect on the results.

²¹ A final reason that spending varies inversely with state population is that the legal limits on contributions are fixed sums, not scaled to state population.

²² In Table 3, column 2, I present the TSLS coefficient estimates for the effect of incumbent and challenger campaign spending, based on the complete sample. The coefficients are 6.46 and -6.00 ($n = 229$), respectively. When the sample was restricted to states with a population of less than 6 million, the coefficients were 6.78 and -7.00 ($n = 142$); for 8 million or less, 7.05 and -6.61 ($n = 148$); for 10 million or less, 6.88 and -6.71 ($n = 152$). All coefficients were significant at the 5% or 1% level.

²³ This is not the variable used by Green and Krasno (1988), who selected a candidate's own lagged spending.

TABLE 1. Sample Statistics for Model Variables

Variable	Mean	Standard Deviation
Incumbent Vote Share	58.95	9.22
Incumbent Spending (1974\$)	.57	.56
Challenger Spending (1974\$)	.30	.40
State Partisanship	3.93	16.59
Ideological Distance	27.76	15.41
State Unemployment Level	6.62	2.11
State Unemployment Level, Incumbent in Governing Party	3.15	3.42
State Population (in millions)	3.60	3.72
Lagged Spending	1.01	1.02
Observations Where the Variable Is 1		
	Percentage	Number
Challenger Wealth	14%	32
Governor	4.4%	10
U.S. Representative	20.1%	46
Major State or Local Official	17.9%	41
Minor Public Official	20.1%	46
Incumbent Scandal	3.1%	7
Incumbent Controversy	6.6%	15
Incumbent Health Problem	2.2%	5
Celebrity Challenger	3.1%	7

Note: There are 229 observations for all variables except lagged spending, where $N = 156$.

ESTIMATION RESULTS

This section reports the results of estimation of the Senate election model. First, I examine the results of OLS regression. I then present the results of instrumental variable estimation.

OLS Estimation Results

Table 2 reports the OLS estimation of the Senate election model for both the full sample of 229 elections and the subsample of 156 elections for which lagged spending was available. The OLS regressions show that, for any given level of spending, challenger spending has roughly twice the marginal effect of incumbent spending. To get some perspective on the coefficient magnitudes in Table 2, I examine the effect on the incumbent's share of the vote of a small change in candidate spending levels. Consider the effect of increasing spending by \$300,000 in a state with a voting age population of 3 million. Since the marginal return decreases as spending increases, base levels must be specified for calculating the marginal effects. Table 1 shows that the mean value of spending per voter in 1974 dollars was 57 cents for incumbents, while the mean value for challengers was only about half that, 30 cents per voter. Using these figures as a base level, the coefficient estimates from Table 2, column 2 imply that adding 10 cents per voter to challenger spending, holding all other variables fixed, reduces the incumbent's share of the vote by 1.13%. A 10-cents-per-voter increase in incumbent spending, holding all other

variables fixed, raises the incumbent's vote share by .33%. The marginal benefit is lower for the incumbent than for the challenger for two reasons. First, the coefficient estimates in Table 2 indicate that, for any given level of spending, an additional dollar is only half as effective for the incumbent as for the challenger. Second, since the benefits from campaign spending exhibit decreasing returns to scale (i.e., the logarithmic function is concave), and incumbents typically have a larger campaign budget than challengers, any spending boost by incumbents is operating at a "flatter" portion of the curve relating money spent to votes received, and so yields fewer votes.

Using the mean values of incumbent and challenger spending and the OLS regression coefficients, the total effect of candidate spending on Senate elections was also calculated. The average incumbent outspent the average challenger nearly two to one, but this larger campaign budget was more than offset by the higher marginal return to challenger spending. The total effect of campaign spending was a 4.97% reduction in the incumbent's vote share.²⁴

A formal test of the hypothesis that the coefficients on challenger and incumbent spending are of equal magnitude was performed for the regressions reported in Table 2. An F -test of the restriction that challenger and incumbent spending effects are of equal size was rejected at the .01 level.

The regressions show that, for any given level of candidate spending, incumbent spending has a smaller marginal effect than challenger spending, but the marginal effect is in the intuitively expected direction and is statistically significant. These results are close to those found in Abramowitz (1988) but different from those reported by Jacobson (1985), who finds incumbent spending statistically insignificant.²⁵

The preliminary conclusion from OLS regressions is that, for Senate elections, the extreme form of the incumbency spending problem, where incumbent spending has no effect, does not exist. Incumbent spending helps, but at any given level of spending, it is only about half as effective as challenger spending. If the arguments regarding the endogeneity of spending made earlier are correct, however, then OLS does not provide consistent estimates of the model. In order to

²⁴ The total effect of campaign spending captures how much the vote total differs from a hypothetical election in which campaign spending played no role. It is calculated as the product of the coefficient on incumbent spending times the value of the spending variable for the average incumbent minus the .01 dollars per voter base level of spending used in constructing the variable plus the product of the coefficient on challenger spending times the value of the spending variable for the average challenger, with challenger's spending level adjusted in the same manner as for the incumbent. The exact calculation of the total effect of campaign spending is $2.19*(4.06) + (-4.04)*(3.43) = -4.97$.

²⁵ Replicating Jacobson's (1985) OLS regressions showed that the main reason for the difference between the Table 3 results and his is Jacobson's treatment of very low spending races. Jacobson regressed the incumbent vote percentage on incumbent spending, challenger spending, and a dummy variable indicating whether the challenger was a Democrat. Jacobson adds only \$1.00 to the raw spending totals, and then takes the log of spending, leading to very large negative values for spending levels near zero, and a poorer fitting model.

get accurate measurement of the effect of spending on the incumbent's vote percentage, the estimation technique should account for the endogeneity of the spending variables.

Table 3 reports the results of TSLS estimation of the Senate election model. The instruments used in the first-stage regressions for the second-stage estimation results shown in columns 1 and 2 were the challenger wealth variable and voting age population; all three instrumental variables were used in the first-stage regressions for the second-stage results shown in columns 3 and 4.²⁶ Table 4 reports the reduced form estimation of the candidate spending levels.

Reestimation using instrumental variables shows an increase in the campaign spending coefficients for both challenger and incumbent, as well as an especially large increase in the effect of incumbent spending. In Table

3, column 2 shows that the marginal effects of incumbent and challenger spending are roughly equal, in contrast to the OLS results. The hypothesis that the coefficients are equal cannot be rejected even at the .10 level. One possible objection to the regressions reported in Table 3 is that the instruments may not be exogenous.²⁷ In order to test the assumption of exogeneity of the instruments, a test of the overidentifying restrictions was performed. The hypothesis that the instruments were exogenous could not be rejected at even the .10 level.²⁸

²⁶ Specification tests to detect heteroscedasticity and autocorrelation were also performed. Comparing the standard error produced by OLS to those generated by White's (1980) heteroscedasticity robust estimator revealed very little evidence of heteroscedasticity. Some senators appear in the data set more than once, raising the possibility of autocorrelated errors. To explore this possibility, the correlation between residuals and six-year lagged residuals was examined. Standard tests for autocorrelation could not reject the null hypothesis of no autocorrelation, even at the .10 level.

²⁷ Wealthy candidates may be attractive to voters if their wealth reduces the chances of corruption, or they may be unattractive if they appear out of touch with the concerns of average people or if wealth inspires resentment. The overall importance of these effects is likely to be small, and the net direction is unclear. It should be noted that among the large body of empirical work on Senate elections, it seems that candidate wealth has never been included as an explanatory variable. Some objections may also be raised regarding the use of population as an instrument, especially if there are scale economies that are not accounted for in the model linking campaign spending to election results. It is not clear that there are important scale economies to spending, and the evidence sometimes taken to indicate their existence (spending is lower in larger states) may be sensibly explained by variation in the supply of funds available to Senate candidates.

²⁸ A formal test of endogeneity of spending levels was performed

Note: Year and party dummy variables are included in all regressions. Columns 1 and 2 use the full sample, and columns 3 and 4 use the subsample for which lagged spending was available. R² is from the second stage regression. * $p < .05$, ** $p < .01$. Standard errors are in parentheses.

Briefly examining the reduced form regressions presented in Table 4, the challenger wealth, voting age population, and lagged spending variables all had the expected signs. There was a statistically significant positive relationship between challenger spending and challenger wealth. Both incumbent and challenger spending showed a statistically significant positive relationship with lagged spending, and negative relationship with voting age population. One interesting finding is the large effect of challenger political experience on challenger spending levels. Political troubles for the incumbent due to controversies are also strongly associated with high levels of spending for both candidates.

The regressions in Table 3 show that, for any given level of spending, incumbent and challenger spending have similar marginal effects on Senate elections.

using a regression-based version of the Hausman-Wu (Hausman 1983) specification test. The fitted values from a regression of incumbent spending and challenger spending on the instruments were included, along with incumbent spending and challenger spending in an OLS regression of the incumbent vote share model. Under the null hypothesis that incumbent and challenger spending are exogenous, the coefficients on the fitted variables should be zero. The F -test of the exclusion restriction is distributed $F(2,192)$ under the null hypothesis that spending levels are exogenous, and the null is rejected at the .01 level. The test was performed using the challenger wealth variable, voting age population, and lagged spending.

These new regression coefficients can be used to recalculate the effects of spending an additional 10 cents per voter by challengers and incumbents, as well as the total effect of candidate spending on Senate election outcomes. Again, the base levels are 57 cents per voter for incumbents and 30 cents per voter for challengers. The results in Table 3, column 2, imply that increasing challenger spending by 10 cents per voter leads to a 1.69% decrease in the incumbent's vote percentage, while a similar increase by incumbents increases their vote percentage by 1.00%. In contrast to the OLS estimates, when we correct for endogeneity bias, we find that for any given level of spending, campaign spending by the incumbent and challenger have similar effects. Yet, raising spending levels a fixed amount still benefits the challenger more than the incumbent. This stems from the fact that the average incumbent has a much larger campaign budget than the average challenger, and the return to additional spending falls as the total amount spent increases.

Recalculation of the total effect of spending shows that the new coefficient estimates reverse the earlier conclusions about the influence of candidate spending on Senate elections. Contrary to the findings based on the OLS regression coefficients, the overall effect of campaign spending strongly favors the incumbent. Us-

Note: Year and party dummy variables are included in all regressions. Columns 1 and 2 use the full sample, and columns 3 and 4 use the subsample for which lagged spending was available. * $p < .05$, ** $p < .01$, *** $p < .001$. Standard errors are in parentheses.

ing mean incumbent and challenger spending levels and the new regression coefficients, the total effect of spending is to boost the incumbent vote by 6.28%, in sharp contrast to the OLS figure of a 4.97% reduction. This reversal is due to the fact that, when endogeneity is taken into account, for each level of campaign spending the incumbent and challenger are roughly equally effective (i.e., the regression coefficients are of the same magnitude), rather than incumbent spending being only about half as effective as challenger spending. Since typical incumbents spend much more than their opponents, the larger campaign budget of incumbents translates into a large electoral advantage. The OLS coefficients, in contrast, imply that the advantage of the incumbent's larger campaign budget is outweighed by the greater effectiveness of challenger spending.

CONCLUSIONS AND FUTURE RESEARCH

Upon showing that the marginal effect of challenger spending in Senate elections is much larger than that of incumbent spending, Abramowitz (1988, 397) noted: "The most important conclusion about the effects of

campaign spending remains secure." The main finding of this article is that the traditional view of incumbent campaign spending does not hold up when OLS regressions are reestimated using an instrumental variables approach. In fact, after taking the endogeneity of spending into account, the marginal effects of incumbent and challenger spending are statistically equivalent. This result is very robust to changes in the set of instruments. The assumptions underlying the TSLS estimation hold up very well; standard statistical tests confirm the endogeneity of candidate spending levels and the exogeneity of the instruments.

In evaluating the implications of the empirical findings, it is important to remember that Senate elections differ from other types of elections. The article's results clearly oppose the traditional view of the relative importance of incumbent and challenger spending in Senate elections. Do the findings also cast doubt on the standard theory for why incumbent spending should matter less than challenger spending?

Jacobson's original theoretical explanation for the ineffectiveness of incumbent spending and the effectiveness of challenger spending applies more forcefully to the House than the Senate. The standard argument

about the relative effectiveness of spending must be modified slightly to apply more closely to the informational environment in Senate elections. It may be that since the difference in voter information about Senate incumbents and challengers prior to the campaign is smaller than the difference between House incumbents and challengers, we should expect more equal spending effects for Senate candidates. If we suppose that Senate challengers are as well known as incumbents, then Jacobson's theory would lead us to expect no difference at all in the effect of challenger and incumbent spending. This reasoning leads to an alternative interpretation of the TSLS results for Senate elections; the findings oppose the empirically derived "rule" that incumbent spending is relatively unimportant in general and in Senate elections in particular, but the results may be consistent with the more general theory that the level of voter familiarity determines when campaign spending does and does not matter.

In fact, the findings contradict not only the generality that incumbent spending is less effective than challenger spending but also the conventional theory for why this may hold. On the first count, informational differences between House and Senate elections cannot explain the empirical finding that spending by Senate challengers and incumbents has the same effect. It is true that the voter information gap is smaller for Senate than for House candidates, but voter familiarity with Senate challengers appears to have been overestimated in early work based on the 1978 CPS/NES sample (Mann and Wolfinger 1980). The level of voter familiarity with Senate incumbents is similar to that for House incumbents, while Senate challengers are in many cases better known than the typical House challenger but often not as well known as the Senate incumbent (Westlye 1991). Thus, the informational advantage of incumbents is smaller in Senate elections, but they appear to enjoy a definite edge. This would lead to a prediction that estimates of spending effects in Senate elections might show a smaller relative advantage for challenger spending over incumbent spending than that observed in House elections, but not no advantage at all.

On the second count, I find that spending by Senate candidates, including incumbents, is very effective. According to the conventional explanation, spending by House incumbents does not increase their vote share because they are already well known. Accordingly, since Senate incumbents and, for the sake of argument let us stipulate Senate challengers, are also well known, spending by Senate candidates should have only minimal effect on the vote. On the contrary, I find that spending by both the challenger and the incumbent has large and statistically significant effects on vote shares.

To sum up, the results indicate that OLS underestimates the effectiveness of incumbent spending in Senate elections. What is more, the new estimates are not easily unified with the standard theory used to explain the difference in the effectiveness of incumbent and challenger spending levels. This implies that the contrary results of some previous work may follow from failure to

account for endogeneity of spending levels, rather than from unique characteristics of Senate elections.

The finding that incumbent spending wins elections has important implications for recent American politics. Campaign finance, and specifically the level of incumbent spending, is a potentially critical factor in the competitiveness of congressional elections. The finding that incumbent spending effects are important also requires reconsideration of the consequences of campaign finance reform. The debate typically turns on what happens to challengers and neglects incumbents. Spending limits that apply to both are seen as severely biased in favor of incumbents. As Jacobson (1980, 186) argues, "campaign spending does have an important effect on who wins [congressional elections] and it is the amount spent by challengers (and other disadvantaged candidates) that actually makes the difference. Spending limits, if they have any effect at all on competition, can only work to the detriment of the challenger." In a companion paper, I conduct simulations of policy alternatives and show that, when the new estimates of incumbent spending effects are used, the conclusions inspired by the traditional view of campaign spending need major revision (Gerber 1993). For example, spending caps, even if set lower than some challengers' campaign spending levels, can significantly increase the chances of challenger victory.

Important issues remain to be addressed. First, the mechanism by which campaign spending influences vote totals is summarized here by a reduced form relationship. This may be a useful approximation of a complicated process, but additional work that attempts to isolate cases in which spending may have greater or lesser effect on election outcomes could lead to important new insights into the role of money in elections.²⁹ One useful direction would be to study variations in resource allocation by candidates, which would permit analysis of when different kinds of spending are most effective.³⁰ Finally, this paper estimates one equation in a multiequation system. Another area for research is to extend current work to examine in detail the sources of candidate funds. The goal of such analysis would be to construct and estimate a full system model linking contributors' and candidates' decisions.

²⁹ Exactly how campaign spending leads to more votes is an ongoing research question. Some theoretical work emphasizes the role of campaign spending in conveying information about the policy positions of the candidate and the opposition when voters are risk averse. Others have included campaign expenditures in the voter's utility function directly. See Hinich and Munger (1989) for a discussion of this literature. Alternative models presumably could emphasize credibility of communications and signalling considerations, as well as the component of spending that does not involve communication with the voters.

³⁰ Relatively little is known about how money is spent. This is due at least in part to difficulties in interpreting candidate expenditure reports, which allow substantial discretion in how expenditures are categorized (personal communication with Robert Biersack, statistician at the Federal Election Commission).

Consequences of the Condorcet Jury Theorem for Beneficial Information Aggregation by Rational Agents

ANDREW McLENNAN *University of Minnesota*

"Naïve" Condorcet Jury Theorems automatically have "sophisticated" versions as corollaries. A Condorcet Jury Theorem is a result, pertaining to an election in which the agents have common preferences but diverse information, asserting that the outcome is better, on average, than the one that would be chosen by any particular individual. Sometimes there is the additional assertion that, as the population grows, the probability of an incorrect decision goes to zero. As a consequence of simple properties of common interest games, whenever "sincere" voting leads to the conclusions of the theorem, there are Nash equilibria with these properties. In symmetric environments the equilibria may be taken to be symmetric.

In addition to his contributions to the theory of elections in which the various agents have different preferences, Condorcet ([1785] 1994) established a result, known as the Condorcet Jury Theorem, giving certain conditions under which majority rule is superior to dictatorship for a society composed of individuals with identical preferences but diverse information. Specifically, Condorcet considered a two-alternative election in which the voters all have the same preferences but do not know which alternative best meets the agreed desiderata, and each voter receives a signal that provides some information about which alternative is better. He contrasted the choices made by any individual acting as a dictator, using only her own signal, with the choices made under majority rule with *sincere voting*, meaning that each voter votes for the alternative that she would choose if only her own information could be brought to bear on the choice, finding that majority rule yields decisions that are better than a dictator's. He also presented a precursor of the statistical fact now known as the *law of large numbers*, showing that the decisions made under majority rule are asymptotically perfect as the population of voters becomes large.

Recent interpretations, variations, and extensions of this result include Berg (1993), Grofman and Feld (1988), Ladha (1992, 1993), Miller (1986), and Young (1988). In these models, as in Condorcet's, it is generally the case that the probability of making the (full information) optimal choice converges to one as the number of voters goes to infinity. Federson and Pesendorfer (1998) is an interesting exception, however, showing that if, instead of majority rule, one of the choices ("convict") is selected only when the vote is unanimous, then there is a positive lower bound on the probability of making a wrong decision that is independent of the size of the electorate. (See also Coughlan [1997], who argues that unanimity may lead to attrac-

tive equilibria when there is either preplay communication, in the form of a straw vote, or the possibility of a mistrial.)

Austen-Smith and Banks (1996) point out that the pertinence of Condorcet's argument, for rational agents, depends, or at least seems to depend, on an assumption (that had rarely been discussed explicitly) that sincere voting constitutes a Nash equilibrium of the game induced by majority rule. They demonstrate that, in fact, this can easily fail to be the case.

Thus, there arises the question of the extent to which the conclusions of the Condorcet Jury Theorem continue to hold when the game induced by the voting procedure is played rationally in the sense that the profile of strategies is a Nash equilibrium. Myerson (1994b) and Wit (1996) give models in which some of the symmetric equilibria have the desired properties: Equilibrium decisions are superior to any individual's (benevolent but only privately informed) dictatorship, and the probability of an incorrect decision goes to zero as the number of agents becomes large. Ladha, Miller, and Oppenheimer (1996) give examples of asymmetric equilibria that outperform the symmetric equilibria and therefore also yield the conclusions of interest. Three papers by Feddersen and Pesendorfer (1996a, 1996b, 1996c) emphasize information aggregation by voters with common, or similar, preferences, but in settings in which there are other voters with different values. These papers display equilibria in which (asymptotically, as the population becomes large) the outcomes are those that would be chosen by a fully informed electorate. The contrasting result of Feddersen and Pesendorfer (1998), that with a unanimity requirement there is a positive lower bound on the probability of making a faulty decision that is independent of the size of the electorate, does not depend on any particular behavioral assumption, so it also pertains to rational agents.

In this article I demonstrate that, in a very general setting, when sincere voting has the desirable properties described by Condorcet, there are Nash equilibria that also have these properties. By assumption all individuals have the same preferences, so the game induced by any voting procedure is a game of common interest: There is a single common utility function. The key observation (Theorem 1 below) is that, for such a

Andrew McLennan is Associate Professor of Economics, University of Minnesota, Minneapolis, MN 55455 (mclennan@atlas.socsci.umn.edu).

I thank Richard McKelvey for bringing literature on the Condorcet Jury Theorem to my attention, and for very helpful and encouraging conversations. I am also grateful to Timothy Feddersen for insightful remarks, and to Beth Allen for comments on an earlier draft.

game, a mixed strategy vector that is optimal, in the sense of maximizing the common utility function, is necessarily a Nash equilibrium. Games of common interest occur in the economic theory of teams, and this fact has been noted by Radner (1972, 1995) and perhaps others as well. There can be other Nash equilibria that are not optimal. In particular, for voting games a profile of votes will be a Nash equilibrium if no single agent can reverse the outcome by changing her vote.

For the Condorcet model this observation implies that whenever sincere voting is a better aggregator than any individual's dictatorship, an optimal strategy profile is both at least as good and an equilibrium. In addition, as the population of voters increases, optimal strategy profiles yield asymptotically perfect decisions whenever sincere voting has this property.

It may happen that optimal equilibria succeed in aggregating information when sincere voting would not. For example, suppose that there are two possible states of nature, G (guilt) and I (innocence), two possible signals, also denoted by G and I , and two possible social alternatives, again denoted by G and I . Suppose that the two states have equal prior probability—the probability that an agent receives signal G when the true state is G is $2/3$ and the probability that an agent receives signal I when the true state is I is $2/3$ —and, conditional on the state, the various agents' signals are statistically independent. Suppose G is the preferred action when G is the state, while I is the preferred action when I is the true state. If it is disastrous to choose G when I is the true state, but only mildly disadvantageous to choose I when the true state is G , then sincere voters will always vote for I . If the population is large, however, expected payoffs under majority rule will be higher if all voters vote their signal (Austen-Smith and Banks [1996] describe such behavior as *informative voting*) since the law of large numbers implies that the best alternative will be chosen with very high probability. Such behavior will not, in general, be an equilibrium (Austen-Smith and Banks 1996, 38, lemma 2), but optimal equilibria will be even more successful in aggregating information.

When the environment is symmetric, in that the agents are interchangeable, an equilibrium assigning different strategies to identical agents embodies a degree of coordination that may seem implausible when the population is large. Myerson (1994a) has argued that population uncertainty, in that the number of players of each type is random, is best modeled by a framework in which asymmetric behavior is not merely implausible but in fact very difficult to describe at all. Theorem 2 establishes that, in a symmetric common interest game, a symmetric mixed strategy profile that is optimal in the set of such profiles is a Nash equilibrium. In the Condorcet model (with majority rule, a unanimity rule for selecting one outcome, or any other supermajority rule) sincere voting is a symmetric profile of strategies, so when it yields better decisions than any individual's dictatorship, there is a symmetric equilibrium that does at least as well.

To show how the optimal profile in the space of symmetric profiles may not be optimal in the space of

all profiles, and to illustrate the framework concretely, we consider the example above, with a unanimity requirement for conviction, specialized to the case of three jurors. For the point we are making it works well to assume that convicting an innocent is only $9/8$ as bad as acquitting a guilty suspect, in which case society, and each juror, will be indifferent between the two possible verdicts when the posterior probability of guilt is $9/17$. There is an equilibrium in which one of the jurors always votes for guilt, and the other two vote informatively. To see that the juror who votes for guilt prefers to do so even with an innocent signal, consider the circumstance in which the vote is relevant, namely when the other two jurors have voted for guilt. Even though the juror has an I signal, she "knows" that the other two jurors have G as their signals, and the resulting posterior probability that the suspect is guilty is $2/3$, which is sufficient to warrant conviction. Normalizing by setting the loss resulting from acquitting a guilty suspect to 1, we may compute that the expected loss in this equilibrium is the sum over states of the prior probability of the state times the probability of making the "wrong" decision times the resulting loss:

$$\frac{1}{2} \cdot \left(\frac{1}{3}\right)^2 \cdot \frac{9}{8} + \frac{1}{2} \cdot \left(1 - \left(\frac{2}{3}\right)^2\right) \cdot 1 = \frac{49}{144}.$$

We compare this with a symmetric equilibrium in which each agent votes for G when their signal is G and for I when the signal is I with a probability that we denote by p . All agents behaving in this manner will be an equilibrium when an agent with signal I is indifferent between the two votes, which occurs when the posterior probability of guilt, assuming the other two voters have voted for guilt, is equal to the cutoff probability:

$$\frac{9}{17} = \frac{\frac{1}{3}\left[\frac{2}{3} + \frac{1}{3}(1-p)\right]^2}{\frac{1}{3}\left[\frac{2}{3} + \frac{1}{3}(1-p)\right]^2 + \frac{2}{3}\left[\frac{1}{3} + \frac{2}{3}(1-p)\right]^2}.$$

One may verify that $p = 3/4$ solves this equation. The expected loss for this equilibrium is

$$\begin{aligned} \frac{1}{2}\left[\frac{1}{3} + \frac{2}{3}(1-p)\right]^3 \cdot \frac{9}{8} + \frac{1}{2}\left(1 - \left[\frac{2}{3} + \frac{1}{3}(1-p)\right]^3\right) \cdot 1 \\ = \frac{13}{32} > \frac{49}{144}. \end{aligned}$$

A strategy in which a juror both sometimes votes G with an I signal and sometimes votes I with a G signal can be a best response only when the juror is never pivotal. Using this fact to reduce the number of cases, it is fairly easy and straightforward to show that the only other symmetric equilibrium has all agents voting for I with probability 1, regardless of signal. The expected loss resulting from this profile is $1/2 > 13/32$, so the symmetric equilibrium above is optimal in the set of symmetric equilibria, and from Theorem 2 it

follows that it is optimal in the set of symmetric profiles.

On the whole the results presented here can be seen as reviving the relevance of the Condorcet Jury Theorem to rational agents: A “sincere” statistical version of the result implies a “rational” strategic version. The endorsement of majority rule obtained in this way is, however, in a sense, weaker than in Condorcet’s original formulation, since there are many voting procedures other than majority rule for which some mode of behavior leads to decisions that are superior to any individual’s dictatorship (or asymptotically perfect decisions for large populations), which is all that is required for our results to be applicable. Passing from sincere to rational agents also raises, or at least reinforces, the criticism that the models of democracy and dictatorship considered here are both artificially encumbered with an assumption that the agents are unable to communicate prior to the voting or decision stage. Unfortunately, the strategic analysis of communication is in its infancy—Coughlan’s (1997) introduction of a straw ballot is an initial step in this direction and representative of the state of the art—so there is little to be said in response at this time.

Since optimal equilibria of common interest games have not been extensively studied elsewhere, it seems appropriate to consider here their status vis-à-vis the extensive literature (e.g., van Damme 1987) that considers “refinements” of the Nash equilibrium concept. Although optimal equilibria of common interest games are, in an obvious sense, desirable, this is not the same as saying that they represent plausible modes of behavior. A refinement of Nash equilibrium is a solution concept that distinguishes some Nash equilibria from the rest, typically by requiring that the “good” equilibria be robust with respect to various types of perturbations of the environment, with the hope that robust equilibria will be more plausible or likely. Here we analyze the optimal (asymmetric) profiles of mixed strategies from the point of view of strategic stability, as defined by Kohlberg and Mertens (1986). Specifically, Theorem 3 asserts that the set of optimal equilibria contains stable sets of equilibria. Since stability is one of the most demanding refinements, it follows that there are always optimal equilibria that are not excluded by other known refinements.

The remainder of this article is organized as follows: The next section introduces basic notation, which is essentially all that needs to be done to make our main point precise. The following section demonstrates the existence of suitable symmetric equilibria in symmetric environments. The penultimate section presents the result on stability, and the final section briefly considers the extent to which our framework might be more general.

OPTIMAL PROFILES OF VOTING STRATEGIES

We now lay out notation for a general voting environment for agents with common preferences and diverse information. In the descriptions of both this object and

the derived normal form game, we emphasize the perspective of agents before they have learned their type, in order to make the common interest property more obvious. The points of view of agents who know their types can obscure this, since expected utilities are conditioned on different information and do not obviously express the commonality of preferences.

Fix a finite set of *alternatives* A , a set of *agents* $I = \{1, \dots, n\}$, spaces of *types* $T_1, \dots, T_n$, and a probability distribution P on $\mathbf{T} := T_1 \times \dots \times T_n$, which is interpreted as the common prior belief concerning the distribution of types. Each agent is informed of her type but does not observe the types of the other agents. Assume throughout that each type of each agent has positive probability under P , so that Bayesian posterior beliefs for each type of each agent are well defined. Fix a function $u : \mathbf{T} \times A \rightarrow \mathbf{R}$, which is interpreted as the common von Neumann-Morgenstern utility function of all agents.

A *voting scheme* consists of nonempty finite sets $V_1, \dots, V_n$ of allowed votes and an *aggregation rule* $f : \mathbf{V} \rightarrow A$ where $\mathbf{V} := V_1 \times \dots \times V_n$. The tuple

$$((T_1, \dots, T_n), P, A, u, (V_1, \dots, V_n), f)$$

is called a *voting environment*.

A (pure) *voting strategy* for agent i is a function $s_i : T_i \rightarrow V_i$, and a *voting profile* is an n -tuple $s = (s_1, \dots, s_n)$ of voting strategies, one for each agent. Typically, each type of each agent will have a unique favorite alternative, prior to learning anything about the types of other agents, but nothing here depends on this. In general, a map $c_i : T_i \rightarrow A$ is *sincere* if

$$(\forall t_i \in T_i) c_i(t_i) \in \operatorname{argmax}_{a \in A} \mathbf{E}(u((t_1, \dots, t_n), a) | t_i).$$

A voting profile s is said to be *acceptable* for f , in the sense that otherwise some individual’s privately informed decisions would be unanimously (weakly) preferred, if, for all i and all sincere $c_i : T_i \rightarrow A$,

$$\begin{aligned} \mathbf{E}(u((t_1, \dots, t_n), f(s_1(t_1), \dots, s_n(t_n)))) \\ > \mathbf{E}(u((t_1, \dots, t_n), c_i(t_i))). \end{aligned}$$

(Due to symmetry, in Condorcet’s formulation all potential dictators are equally adroit. It seems closest to the spirit of his argument to compare the performance of the most effective potential dictator, but everything below would be equally valid, *mutatis mutandi*, if we took the most inept potential dictator, or, for that matter, any of a variety of notions of an “average” dictator, as the standard of comparison.) We extend this terminology to profiles of mixed voting strategies (viewed here as mixtures over pure voting strategies, though behavior strategies [Kuhn 1953] would be equivalent) in the obvious way, by requiring that the induced expected utility is greater than what any agent could attain with only private information.

Since Condorcet’s theorem, and its variants and extensions, require a notion of sincere voting, the general notion makes sense only when $V_i = A$ for all i . We might say that a *Condorcet Jury Theorem of the first*

type is any result stating that any profile $(c_1, \dots, c_n)$ of sincere maps is an acceptable aggregator. A *Condorcet Jury Theorem of the second type* is a result that considers a sequence of voting environments in which the number of voters goes to infinity, and which asserts that sincere voting yields probabilities of suboptimal decisions that go to zero asymptotically.

We now introduce notation for (normal form) common interest games for the given set of agents I . For each i let S_i be a finite set of *pure strategies*, let $\mathbf{S} := S_1 \times \dots \times S_n$ be the set of *pure strategy profiles*, and let $U : \mathbf{S} \rightarrow \mathbf{R}$ be a function that is interpreted as the common von Neumann-Morgenstern utility function of all agents in I . Such a framework is derived from the general voting environment above by letting $S_i = A^T$ be the set of voting rules for each agent i , and letting

$$U(s_1, \dots, s_n) = E(u((t_1, \dots, t_n), f(s_1(t_1), \dots, s_n(t_n)))).$$

The set of mixed strategies for i is denoted by $\Delta(S_i)$, with typical elements $\mu_i, \mu'_i, \dots$. The set of *mixed strategy profiles* is $\Sigma := \Delta(S_1) \times \dots \times \Delta(S_n)$. Abusing notation, we let U denote also the mixed extension of U , that is, the unique multilinear function $U : \Sigma \rightarrow \mathbf{R}$ that agrees with the original U when we identify the elements of $\mathbf{S}$ with the corresponding vertices of Σ .

We reiterate our main finding.

THEOREM 1: *For a game of common interest given by $S_1, \dots, S_n$ and U , if*

$$(\mu_1^*, \dots, \mu_n^*) \in \operatorname{argmax}_{(\mu_1, \dots, \mu_n) \in \Sigma} U(\mu_1, \dots, \mu_n),$$

then $(\mu_1^*, \dots, \mu_n^*)$ is a Nash equilibrium.

Proof: For each i the hypothesis clearly implies that

$$\mu_i^* \in \operatorname{argmax}_{\mu_i \in \Delta(S_i)}$$

$$U(\mu_1^*, \dots, \mu_{i-1}^*, \mu_i, \mu_{i+1}^*, \dots, \mu_n^*). \quad Q.E.D.$$

If the common interest game is derived from a voting environment as above, and there is any strategy vector that is acceptable for the aggregation rule f , then $(\mu_1^*, \dots, \mu_n^*)$ must also be acceptable for f . In particular, a Condorcet Jury Theorem of the first type implies the existence of a Nash equilibrium that is an acceptable aggregator. If, along some sequence of voting environments, the probability of a correct decision under any sequence of strategy vectors goes to one, then the probability of a correct decision under any optimal mixed strategy will also converge to unity. Thus, a Condorcet Jury Theorem of the second type implies the existence of a sequence of Nash equilibria for which the probability of a correct decision goes to one.

SYMMETRY

We now consider symmetric voting environments. The aggregation rule f is *anonymous* if $V_i = V$ is the same for all i and the chosen alternative depends only on the numbers of agents casting the various possible votes. More formally, $f(v_{\sigma(1)}, \dots, v_{\sigma(n)}) = f(v_1, \dots, v_n)$ for

all $(v_1, \dots, v_n) \in V^n$ and all permutations $\sigma : \{1, \dots, n\} \rightarrow \{1, \dots, n\}$. The notion of symmetry relevant to our analysis also requires that the information structure and u are symmetric in the sense that $T_1 = \dots = T_n =: T$ and

$$P(t_{\sigma(1)}, \dots, t_{\sigma(n)}) = P(t_1, \dots, t_n)$$

and

$$u((t_{\sigma(1)}, \dots, t_{\sigma(n)}), a) = u((t_1, \dots, t_n), a)$$

for all $(t_1, \dots, t_n) \in T^n$, all permutations σ , and all $a \in A$. We say that the voting environment is *symmetric* when all these symmetry conditions are satisfied.

Turning to the common interest game given by $S_1, \dots, S_n$ and U , we say that this game is symmetric if $S_1 = \dots = S_n =: S$ and

$$U(s_{\sigma(1)}, \dots, s_{\sigma(n)}) = U(s_1, \dots, s_n)$$

for all $(s_1, \dots, s_n) \in S^n$ and all permutations σ . I leave to the reader the conceptually simple, but tedious, algebraic exercise of showing that a symmetric voting environment induces a symmetric common interest game. When the game given by $S_1, \dots, S_n$ and U is symmetric we may say that a mixed strategy profile $(\mu_1, \dots, \mu_n)$ is symmetric if $\mu_1 = \dots = \mu_n$.

THEOREM 2: *Suppose that the game given by $S_1, \dots, S_n$ and U is symmetric. If a symmetric mixed strategy profile $(\mu, \dots, \mu)$ is maximal for U in the set of such profiles, then it is a Nash equilibrium.*

Since the space of symmetric mixed profiles is compact, the existence of a symmetric equilibrium follows as a corollary, but this is a (very) special case of a result of Nash (1951).

Proof: If $(\mu, \dots, \mu)$ is not Nash, then there is a mixed strategy v such that $U(v, \mu, \dots, \mu) > U(\mu, \dots, \mu)$. Applying multilinearity and symmetry, we find that $(\mu, \dots, \mu)$ is inferior to the symmetric strategy vector obtained by having each agent combine a high proportion of μ with a small bit of v , contrary to hypothesis. Specifically, for all $\varepsilon \in [0, 1]$ we have

$$U((1-\varepsilon)\mu + \varepsilon v, \dots, (1-\varepsilon)\mu + \varepsilon v) = U(\mu, \dots, \mu) + \varepsilon(U(v, \mu, \dots, \mu) - U(\mu, \dots, \mu)) + \varepsilon^2 P(\varepsilon),$$

where P is a polynomial function of ε , so

$$U((1-\varepsilon)\mu + \varepsilon v, \dots, (1-\varepsilon)\mu + \varepsilon v) > U(\mu, \dots, \mu)$$

for sufficiently small $\varepsilon > 0$.

Q.E.D.

Therefore, to produce an equilibrium symmetric (mixed) strategy vector that is acceptable for f , it suffices to prove the existence of a (possibly nonequilibrium) symmetric mixed strategy vector with this property. For this condition to make sense the model must give all agents the same set of allowed votes, but again this set need not be A .

STABILITY

Especially when they are asymmetric, the optimal strategy profiles may prescribe behavior that is complex and highly coordinated, or implausible on other grounds. Nevertheless, these profiles do survive the criteria posed by the literature on refinements of Nash equilibrium, as we now explain.

If $\hat{\sigma} \in \Sigma$ and $\varepsilon = (\varepsilon_1, \dots, \varepsilon_n) \in (0, 1)^n$, the *perturbed game* induced by $(\hat{\sigma}, \varepsilon)$ is the common interest game with the original pure strategy sets and the perturbed utility function

$$U_{(\hat{\sigma}, \varepsilon)}(s) := U((1 - \varepsilon_1)s_1 + \varepsilon_1\hat{\sigma}_1, \dots, (1 - \varepsilon_n)s_n + \varepsilon_n\hat{\sigma}_n).$$

Recall (Selten 1975) that a mixed strategy profile σ^* is a *perfect equilibrium* if there are sequences $\{\hat{\sigma}^r\}$, $\{\varepsilon^r\}$, $\{\sigma^r\}$ such that: (a) for each r , σ^r is a Nash equilibrium of the perturbed game induced by $(\hat{\sigma}^r, \varepsilon^r)$; (b) $\varepsilon_i^r \rightarrow 0$ for each i ; (c) $\sigma^r \rightarrow \sigma^*$. A compact set E of Nash equilibria is *robust with respect to trembles* if, for any neighborhood W of E , there is $\delta > 0$ such that for all $\hat{\sigma}$ and ε with $\varepsilon_i < \delta$ for all i , W contains an equilibrium of the perturbed game induced by $(\hat{\sigma}, \varepsilon)$. The arguments below use the (obvious) fact that if E is robust with respect to trembles, and F is a compact set of Nash equilibria that contains E , then F is robust with respect to trembles. If E is robust with respect to trembles and has no compact proper subset that is robust with respect to trembles, then E is *stable* (Kohlberg and Mertens 1986). Ideally, one would like to find stable singletons (when this happens the unique element is said to be a *strictly perfect equilibrium*), but it is possible that there are none (e.g., §1.5 of van Damme 1987).

Our interest in stable sets of equilibria is not predicated on a belief that stability is, in some sense, the “correct” or “ideal” refinement of Nash equilibrium. It is a very demanding criterion, in that stable sets necessarily contain equilibria satisfying a variety of other refinement criteria, so the result below reinforces the pertinence of optimal equilibria from a variety of points of view. In addition, stability has interesting relationships with analyses of equilibrium selection motivated by considerations quite different from those adduced by Kohlberg and Mertens; for an example see Swinkels (1992).

Let $M := \max_{(s_1, \dots, s_n) \in S} U(s_1, \dots, s_n)$ and let $K := U^{-1}(M)$ be the set of optimal mixed strategy profiles. It is interesting to note that K can be characterized as the union of the various sets $\Delta(R_1) \times \dots \times \Delta(R_n)$ where $R_1, \dots, R_n$ is a collection of subsets of $S_1, \dots, S_n$, respectively, such that $U(r_1, \dots, r_n) = M$ whenever $r_1 \in R_1, \dots, r_n \in R_n$.

THEOREM 3: K is robust with respect to trembles.

The following argument is another application of this article’s key insight: The perturbed game induced by $(\hat{\sigma}, \varepsilon)$ is a game of common interest, so an optimal strategy vector must be an equilibrium. If the perturbation is small, then the utility obtained from such an optimal strategy vector cannot be much less than the optimal utility of the original game, so the strategy

vector must be close to the set of strategy vectors yielding this utility.

Proof: For a given neighborhood W of K choose $\gamma > 0$ small enough that $K_\gamma := \{\sigma \in \Sigma : U(\sigma) > M - \gamma\}$ is contained in W . Choose $\delta > 0$ small enough that

$$U(\sigma) - \gamma/2 < U_{(\hat{\sigma}, \varepsilon)}(\sigma) < U(\sigma) + \gamma/2$$

for all σ , $\hat{\sigma}$, and ε with $\varepsilon_1, \dots, \varepsilon_n < \delta$. Fixing $(\hat{\sigma}, \varepsilon)$ with $\varepsilon_1, \dots, \varepsilon_n < \delta$, let σ^* be a maximizer of $U_{(\hat{\sigma}, \varepsilon)}(\cdot)$. Just as earlier, σ^* is clearly a Nash equilibrium of the perturbed game induced by $\hat{\sigma}$ and ε . We have $U_{(\hat{\sigma}, \varepsilon)}(\sigma) > M - \gamma/2$ whenever $\sigma \in K$, so $U_{(\hat{\sigma}, \varepsilon)}(\sigma^*) > M - \gamma/2$ and thus $U(\sigma^*) > M - \gamma$, whence $\sigma^* \in K_\gamma \subset W$, as desired. Q.E.D.

COROLLARY: K contains a stable set of equilibria.

Proof: Let $\{O_1, O_2, \dots\}$ be a countable base¹ of the topology of Σ . Set $K_0 := K$, and define $K_1, K_2, \dots$ inductively by setting $K_{j+1} := K_j \setminus O_j$ if $K_j \setminus O_j$ is robust with respect to trembles, and otherwise setting $K_{j+1} = K_j$. Then each K_j is compact and robust with respect to trembles. Clearly $K_\infty := \bigcap_j K_j$ is also compact and nonempty. (One may take a convergent subsequence of a sequence $\{x_j \in K_j\}$.) If K_∞ was not robust with respect to trembles, it would have a neighborhood W such that for all $\delta > 0$ there was some $(\hat{\sigma}, \varepsilon)$ with $\varepsilon_i < \delta$ for all i , such that the perturbed game induced by $\hat{\sigma}$ and ε had no equilibria in W . But $K_j \subset W$ for large j (else the limit of a convergent subsequence of a sequence $\{x_j \in K_j \setminus W\}$ would be a point in $K_\infty \setminus W$) contrary to the presumed robustness of K_j . Therefore, K_∞ is robust with respect to trembles. If K_∞ is not minimal in the class of compact sets that are robust with respect to trembles, then, for some j , $K_\infty \setminus O_j \neq K_\infty$ is robust with respect to trembles. But $K_\infty \subset K_j$, so $K_j \setminus O_j$ is robust with respect to trembles and $K_\infty \subset K_{j+1} = K_j \setminus O_j$, so that $K_\infty = K_\infty \setminus O_j$. This contradiction completes the proof. Q.E.D.

CONCLUDING REMARKS

Certainly the framework of this article is very general in comparison with most models considered in related literature. Additional generality can be attained easily by allowing voting schemes that yield nontrivial lotteries over the set of alternatives; this has no effect on the arguments. In particular, by identifying a probability that an agent does not vote with a probability that her vote does not count, one may represent situations in which the population of voters is random. From a mathematical point of view, the main losses of generality in the framework are those associated with the finiteness of the sets of agents, types, and alternatives. I hope that mathematically sophisticated readers will agree that the arguments underlying theorems 1 and 2 are not critically dependent on these assumptions, at least in the sense that only minor and mundane tech-

¹ That is, any open set is a union of members of $\{O_1, O_2, \dots\}$. For example, we may take the open balls of rational radii whose centers have rational coordinates.

nical details arise in the extensions to several sufficiently well behaved infinite dimensional settings.

Civility, Enlightenment, and Society: Conceptual Confusions and Kantian Remedies

JAMES SCHMIDT *Boston University*

Critics of what is called the "Enlightenment project" have argued that it has been responsible for a number of current social pathologies. At the same time, the term "civil society" has been used to designate those patterns of solidarity that the Enlightenment project allegedly disrupts. This article (1) argues that characterizations of the Enlightenment project tend to be elusive and historically questionable, (2) suggests that the concept of civil society is ambiguous in both its object and its intent, (3) explores how Kant provided a more rigorous account of the relationship between enlightenment and civil society, an account which rests on a contrast between civil and cosmopolitan society, and (4) considers some of the difficulties that plague attempts to define "civility" as a virtue.

Writing in the *Berlinische Monatsschrift* in 1784, Immanuel Kant speculated that the "hidden plan of nature" was to bring about justice in civil society and peaceful relations between nations by means of the very antagonism that seemed to promise only civil unrest and international conflict. He assured his readers that "though folly and caprice creep in at all times, enlightenment gradually arises," and thus the "chiliastic expectations" of philosophy for the triumph of justice were something more than an illusion (Kant [1784] 1923, 27–8). As we close this millennium, Kant's "chiliastic expectations" regarding enlightenment and civil society do not appear to be generally shared.

Over the last several decades, a remarkably diverse group of philosophers and social critics have traced the origin of a number of social and cultural maladies to something they call the "Enlightenment project." Over the same period, an equally diverse group of political and social commentators have hailed the promise of, lamented the demise of, or sought ways to reinvigorate what they call "civil society." The concerns at stake in these discussions would appear to be related. As Kant's essay shows, the nature and promise of civil society were important concerns in the Enlightenment. Yet, with a few exceptions, current debates over the viability of the Enlightenment project and discussions of the prospects for civil society are conducted in different registers. On those rare occasions when the relationship between the two notions is broached, some commentators tend to see greater difficulties than Kant.

Consider, for example, the explanation that Berger and Neuhaus ([1976] 1996, 161) offer for the tendency of liberalism to underestimate the role played by "mediating structures" in public policy:

Liberalism's blindness to mediating structures can be traced to its Enlightenment roots. Enlightenment thought is abstract, universalistic, addicted to what Burke called "geometry" in social policy. The concrete particularities of mediating structures find an inhospitable soil in the liberal

garden. There the great concern is for the individual ("the rights of man") and for a just public order, but anything "in between" is viewed as irrelevant, or even an obstacle, to the rational ordering of society. What lies in between is dismissed, to the extent it can be, as superstition, bigotry, or (more recently) cultural lag.¹

This argument repeats a long-standing charge against the Enlightenment: While it proved effective in tearing down what tradition had wrought, it was unable to foster those mediating structures which sustain civil society. This was the common theme of such otherwise dissimilar works as Burke's *Reflections on the Revolution in France* ([1790] 1987) and Tocqueville's *The Ancien Régime and the French Revolution* ([1856] 1955). Such an argument also played a central role in Hegel's account of the relationship between the Enlightenment and the Terror in the *Phenomenology of Spirit* ([1806] 1977). Something similar may be found in Nietzsche's suggestion that the Enlightenment's critique of religion was but the first step toward a critique of the idols of science, morality, and reason that carried with it the prospect of a collapse into nihilism.

This paper proposes that arguments of this sort rest on confusions about what the Enlightenment involved and what civil society implies. They invoke a characterization of the Enlightenment that is historically questionable and an understanding of civil society that is rarely clearly defined. To understand what is amiss, it will be necessary to (1) examine the radically different ways in which the Enlightenment is understood by social critics and by historians, (2) explore some of the ambiguities that plague the concept of civil society, (3) return to Kant, in order to consider an alternative way of thinking about the relationship between Enlightenment and civil society, and (4) consider some of the difficulties that plague accounts of the virtue of civility.

CRITICIZING THE ENLIGHTENMENT PROJECT

In recent decades the notion that there is something short-sighted, narrow, and deficient about the Enlight-

James Schmidt is Professor of Political Science, Boston University, Boston, MA 02215.

This article is drawn from a paper presented at a UNESCO Conference, "Future Ethics," held at the Institute of Cultural Pluralism, Candido Mendes University, Rio de Janeiro, July 2–4, 1997. I am indebted to Enrique Larreta, the executive director of the ICP, for inviting me to draw some connections.

¹ For a discussion of the significance of Berger and Neuhaus's notion of "mediating structures" for current discussions of civil society, see Dionne 1997.

enment has become so pervasive that many commentators, as Wilson (1987, 53) observed, find it impossible to resist the temptation to

take a punch at enlightenment thought. . . . It is difficult to get through an academic day without having to witness somebody jabbing away just to enjoy the pleasure of getting off on the demystification of the functioning of humanist ideals or slapping the Enlightenment around with the intention of knocking it out of its stupor and redeeming the hopes of mastery of nature by reason.

Wilson's quip highlights one of the more distinctive features of recent criticisms of the Enlightenment project: Today, punches are thrown from the Left as well as the Right, and the Enlightenment stands accused not only of undermining tradition but also of reinforcing patriarchy, fostering anti-Semitism, sustaining an ideology of white supremacy, embracing a vision that sees progress only in terms of the ever-increasing subjugation of nature, and—more generally—harboring a hostility toward “otherness” in any of its forms (Schmidt 1996, 1). As a way of sorting out the different charges that have been raised, it might be useful to outline, briefly, three different versions of the critique of the Enlightenment project.

The first and perhaps most familiar line of criticism argues that the indifference of Enlightenment rationality to traditional norms and practices destroys the ties that bind individuals together into societies, paving the way for complete anarchy or the rule of brute force. The locus classicus for this interpretation is Burke's *Reflections on the Revolution in France*. Criticizing French “literary men and politicians” as having “no respect for the wisdom of others,” Burke argues that the fatal flaw of the Enlightenment lay in its habit of “exploding general prejudices” rather than seeking “to discover the latent wisdom which prevails in them.” Because “prejudice, with its reason,” is capable of moving men to action in a way that “naked reason” cannot, it is wiser “to continue the prejudice, with the reason involved, than to cast away the coat of prejudice and leave nothing but the naked reason” (Burke [1790] 1987, 76–7). More recent versions of this line of criticism may be found in Oakeshott's ([1962] 1991) critique of political “rationalism” or Gadamer's ([1960] 1989) critique of the Enlightenment's “prejudice against prejudice.” We also find it in passing swipes at the Enlightenment by conservative and neoconservative commentators.

A second line of criticism originates in Hegel's discussion, in the *Phenomenology of Spirit*, of the transformation of Enlightenment into Terror. While much of Hegel's imagery bears a striking resemblance to Burke, his argument differs in crucial ways. Where Burke sought to defend the reason of tradition against the abstractions of philosophers, Hegel argues that the central failing of the Enlightenment was that it was insufficiently enlightened about the limitations of its own conception of reason. The struggle between faith and Enlightenment turns out to be little more than shadow boxing, since all that Enlightenment can offer in place of religious faith is a faith of a different sort: a

belief in the primacy of the category of utility. Enlightenment proves to be “irresistible” in its struggle with faith, but its victory is a bitter one, as is amply demonstrated, in Hegel's view, by the collapse of the French Revolution into Terror. A politics guided by utility alone can produce nothing except “the coldest, shallowest of deaths, with no more significance than cleaving a cabbage head or swallowing a gulp of water” (Hegel [1806] 1977, 360, translation modified).² A more recent version of this line of criticism can be found in the account of the self-destruction of Enlightenment sketched by Horkheimer and Adorno ([1947] 1972).³

A third line of criticism originates in the work of Nietzsche, whose stance toward the Enlightenment reflects a profound ambivalence. In some of his discussions of the Enlightenment he calls for the rescue of what he characterizes as its original aristocratic ideals from the contaminating influences of democracy and egalitarianism that he associates with Rousseau and the French Revolution (Nietzsche [1878] 1986, 169, 367; [1882] 1974, 293; [1888] 1968b, 101–2). On other occasions, however, he suggests that the Enlightenment's critique of religion was but the first faltering step in the direction of a thoroughgoing critique of the idols of science, morality, and reason, and this carried within it both the danger of a collapse into nihilism and the promise of a new Enlightenment in which the idea of aesthetic self-fashioning would replace the search for universal values (Nietzsche [1882] 1974, 181; [1883–88] 1968a, 56). Nietzsche's present-day heirs are a motley lot, encompassing both those who, like Gray (1995), share his conviction that the Enlightenment paves the way to nihilism but who reject his aestheticization of ethics and those who, like Foucault, are more concerned with exploring the workings of power and knowledge than with meditating on the danger of nihilism (Schmidt and Wartenberg 1994).

Each of these lines of criticism has a different sense of what ought to be done in the face of the damage allegedly wrought by the Enlightenment. The solution of latter-day Burkeans is perhaps the most familiar: They counsel a defense of traditional norms where they still survive, a distrust for any social policy that smacks of rational “social engineering,” and support for measures that strengthen the damaged “mediating institutions” of civil society. Those who take Hegel's account as their point of departure, in contrast, are concerned to elaborate a conception of rationality that seeks to transcend the limits of instrumental reason (Habermas 1987). And Nietzsche's present-day disciples may, like Gray, embrace Heidegger's notion of *Gelassenheit* as a means of avoiding the nihilism they see inherent in the Will to Power (Gray 1996, 182–3) or seek, as Foucault did in his last writings, to redefine Enlightenment as an open-ended project of self-creation (Foucault 1984,

² For a discussion of the peculiar images Hegel employs, see Schmidt 1998.

³ Horkheimer himself saw the work as an elaboration of Hegel's basic thesis. See his letter to Friedrich Pollock of May 7, 1943 (Horkheimer 1996, 446).

32–50). But if the proposed antidotes for the damage done by the Enlightenment are remarkably diverse, the picture of the Enlightenment that emerges from these critics is strikingly consistent. Let us review its main features.

First, the Enlightenment is routinely characterized as embracing a conception of reason that is held to be insufficiently sensitive to its own limits. Sometimes it is criticized for underestimating the degree to which norms and values can be detached from traditions and conventions of everyday life, resulting—as MacIntyre (1981) has argued—in a situation in which moral discourse has lost all meaning. Other critics charge that it embraces a restricted understanding of reason, modeled on the natural sciences, which equates reason with the successful manipulation of nature, resulting in the rule of “instrumental reason” (Horkheimer 1947). Still others suggest that it naively underestimated the role played by passions and sentiments in human conduct and, as a result, leads to a wildly impractical politics, which Oakeshott ([1962] 1991, 27–31) characterized as a “politics of the book” or an “abridgement of a tradition.” Whatever the particular form of the criticism, the central charge remains the same: The Enlightenment represents an uncritical rationalism that is dangerously unaware of the complexity of reality.

Closely related is the charge that, because the Enlightenment loses itself in abstract universality, it has an ignorance of, or worse still, a contempt for the particular, the local, the specific. According to Oakeshott ([1962] 1991, 9), the “political rationalism” that is the bitter legacy of the Enlightenment combines a “politics of perfection” with a “politics of uniformity.” Horkheimer and Adorno ([1947] 1972, 6) provide an even more chilling image: Enlightenment, in their view, is inherently “totalitarian.” Critics from the Left have charged that its talk of universal rights remained oblivious to inequalities in gender, race, and class, while those on the Right argue that by reducing all social relations to a series of abstract and impersonal rights, it tears the fabric of society to pieces. In all these cases, the Enlightenment stands accused not simply of being uncritically rationalist but of being insufficiently concerned with particularity.

It is further argued that the abstract, uncritical conception of reason embraced by the Enlightenment culminates in an obsession with domination and control. Thus, in Foucault’s *Discipline and Punish* (1979), the prisoners who have been freed from the darkness of the dungeon are captured all the more securely in the light that floods through the Panopticon. In Horkheimer and Adorno’s *Dialectic of Enlightenment* ([1947] 1972), the ultimate project of the Enlightenment is the domination of nature and of other human beings. And for Gray (1996, 166, 180), the Enlightenment project is yet another manifestation of that “Will to Power” which lies at the heart of the “Western humanist hubris.”

Finally, the Enlightenment’s critics are united in the conviction that there *is* such a thing as *an* Enlightenment project—that it is possible to attribute a common set of intentions to a rather diverse group of thinkers,

scattered across a number of different nations. Critics may differ on how exactly this project is to be defined, just as there is considerable difference, from critic to critic, as to who counts as a representative of it. But central to all these criticisms is the conviction that it makes sense to speak of a single, coherent Enlightenment project. While such a possibility is taken as unproblematic by the critics, their confidence is hardly reflected in historical accounts of the period.

In a recent overview, Outram (1995) observed that as historians of the Enlightenment have moved from an examination of a limited canon of works by a few famous (and typically French) authors to a consideration of the Enlightenment as a social, political, and cultural transformation exhibiting a remarkable range of national and confessional variations, it has become more difficult to speak of the Enlightenment as “a unitary phenomenon.” “It might . . . seem that as our picture of the Enlightenment became more complex, as we have begun to study ideas not as autonomous, discrete objects, but as deeply embedded in society, so the term Enlightenment itself might have become increasingly obscure or even meaningless” (Outram 1995, 12).

To the extent that it is still possible to impute an identity to the Enlightenment, Outram (1995, 12) suggests that it must be viewed “as a *capsule* containing sets of debates, stresses and concerns, which however differently formulated or responded to, do appear to be characteristic of the way in which ideas, opinions and social and political structures interacted and changed in the eighteenth century.” This diversity is precisely what the critics tend to overlook when they speak as if there were a single, unitary Enlightenment project.

Gray’s *Enlightenment’s Wake* (1995) exemplifies how far afield a critic can go when trying to define the Enlightenment project. Turning first to MacIntyre’s *After Virtue* (1981), he argues that while Enlightenment thinkers may have held differing views on other topics, they were at one in calling for “an independent rational justification of morality” (Gray 1995, 147). Rather quickly, he extends the Enlightenment project to embrace the “refounding” of “society” as well as “morality” on “universal, tradition-independent rational principles,” a project to which “liberalism as a doctrine was, in all of its varieties, unreservedly committed” (pp. 149–50). A few pages later, the “Enlightenment project of human self-emancipation” is characterized as the “naturalistic form” of the “most fundamental Western commitment, the *humanist* conception of humankind as a privileged site of truth,” a commitment that had been expressed in both “Socratic inquiry and in Christian revelation” (p. 155). Having equated the Enlightenment project with liberalism and humanism, Gray next characterizes it as also embracing the “modernist world-view,” with its “conception of science as the supremely privileged form of knowledge,” a supremacy that is, in turn, defined in terms of a view of the natural world as “an object of human exploitation” (p. 158). Within a few more pages, a “commitment to rationalism” becomes one of the “defining elements of the modernist world-view of which the Enlightenment

project is the most powerful expression" (p. 160). Several paragraphs later, the Enlightenment is characterized as "foundationalist," "representationalist," and "logocentric" (p. 160).

In Gray's account, the definition has so many differing characteristics that it is uncertain whether it makes sense to speak of a single, all-encompassing project. The attempt to provide "an independent rational justification of morality" (the characterization of the Enlightenment project that Gray takes from MacIntyre) does not require or even imply a view of the natural world as "an object of human exploitation" (a characterization Gray takes from Heidegger and from Horkheimer and Adorno). While the primacy accorded to the natural sciences merges rather easily into the project of the domination of nature, it is not entirely obvious that an "independent rational justification of morality" must ultimately be grounded in the natural sciences: For a thinker such as Kant, it obviously was not. It is also less than clear that "liberalism" is necessarily part of the Enlightenment project: Not all advocates of Enlightenment embraced liberalism, and there were eloquent defenders of liberalism who were also vigorous critics of the Enlightenment.⁴ It is easy enough to make the "foundationalist," "representationalist," and "logocentric" characterization (after all, is not *everything* since the pre-Socratics "representationalist" and "logocentric"?), but the price is to obscure a good deal of difference between a foundationalist procedure which, following Descartes, seeks to find a ground for reason and Kant's attempt to provide what O'Neill (1989, 3–27) has described as a "constructivist" vindication of reason.⁵

Accounts of the failure of the Enlightenment project such as Gray's typically tend to rest on criticisms of a number of separate and detachable claims. Thus, when critics take aim at the project's "rationalism," they are raising questions about the ability of reason to provide a grounding for law or morality. When they criticize its "scientism," they are questioning the adequacy of a criterion of rationality that is measured in terms of instrumental efficacy. When they point to its naive commitment to "progress," they are questioning the possibility of evaluating all societies and cultures in terms of a single measure of "development." Cobbling distinguishable claims such as these into something called the Enlightenment project misses an essential point: Criticisms of these very same claims were advanced by thinkers typically associated with the Enlightenment. Hume, for example, had doubts about the prospect of constructing a moral philosophy grounded on reason alone, Kant's entire critical philosophy can be viewed as an attempt to define reason in something other than instrumentalist terms, and both Voltaire and Diderot offered extensive criticisms of the idea of progress. What is bravely called the Enlightenment

project thus turns out to be a pastiche of arguments, each of which—when viewed separately—would find critics within the Enlightenment itself.

Thus, current discussions of the Enlightenment are marked by a paradox. Those who speak most confidently of it as a single, coherent project have little confidence in the alleged project's viability. Those who speak with most competence about the historical reality of the Enlightenment have little confidence in offering a general characterization of what the Enlightenment was attempting to achieve. Thus, the Enlightenment project is coherent only for those who are in the process of rejecting it, while those who examine it more closely find the object of their concern dissolving into a host of particulars.

INVOKING CIVIL SOCIETY

In the writings of scholars, social critics, and political activists, the invocation of civil society is even more pervasive than criticisms of the Enlightenment project. During the 1970s and 1980s, critics of authoritarian regimes in both Eastern Europe and Latin America used the notion as a rallying point (Arato and Cohen 1992, 29–36, 48–69). Since then, it has played a major role in discussions of the prospects for democratization (Gellner 1996, 1–12). Over the last decade, social scientists have looked for signs of its emergence in societies where conventional wisdom assumed it did not exist (Hann and Dunn 1996; Schwedler 1995) and have sought to explain its apparent demise in the United States (Putnam 1995). Over the last few years its "renewal" has been the object both of foundation support and of proposed legislation—witness the Project for American Renewal drafted by Senator Dan Coats (R-Indiana), which consists of a series of measures designed to halt "the decline of civil society" by providing support for "families, churches, neighborhoods, voluntary associations" (Coats 1996).

Like the Enlightenment project, the meaning of "civil society" tends to be rather elusive. Shils's (1992, 3) often-quoted definition reads like a sketchy set of directions: "Civil society lies beyond the boundaries of the family and clan and beyond the locality; it lies short of the state." There is, however, a good deal to be found beyond the family but short of the state: markets, voluntary associations, churches, interest groups, labor unions, nongovernmental organizations, and Robert Putnam's (1995) steadily dwindling bowling leagues. It remains an open question whether much is gained by gathering these different forms of association together under a single label (Kumar 1993). Furthermore, rival sets of directions explain where civil society may be found: Arato and Cohen (1992, ix) differ from Shils by placing civil society "between economy and state" and arguing that it is "composed above all by the intimate sphere (especially the family), the sphere of association (especially voluntary associations), social movements, and forms of public communication." The possibilities for dispute about just what—and where—civil society is would appear to be endless.

Invocations of civil society resemble criticisms of the

⁴ For one example, see Friedrich Heinrich Jacobi, "Something Lessing Said" (Schmidt 1996, 191–211).

⁵ "Post-modernist" critics almost habitually equate Descartes and Kant. See, for example, Cornel West's comments on what he calls the "Cartesian-Kantian picture" (West 1979, 68).

Enlightenment project in a second respect: They come from across the ideological spectrum (Walzer 1991). Opponents of authoritarian regimes employ the term to denote something like the rights and liberties long associated with liberal democracies. Radical democrats use it to denote the ideal of an engaged, active citizenry, directly involved in public deliberation. For libertarians, it designates a market society, free from political coercion. For communitarians, it evokes the network of voluntary associations and the civic virtues they engender. If the Enlightenment project serves as a catch-all category that designates whatever particular aspect of the modern world aggravates the critic who marshals it, so "civil society" appears to be an equally elastic category, designating whatever the social critic finds central to the particular vision of society that is being articulated.

The looseness of the term may be attributed partly to the fact that, unlike "the Enlightenment," "civil society" has generally served as a theoretical concept used to designate a certain form of association rather than as a way of denoting a particular period.⁶ Theorists are thus at liberty to propose new definitions, often with only the slightest familiarity with earlier formulations. The term first entered the world as a way of translating *koinonia politikē*, coined by Aristotle to describe the form of association more commonly termed a *polis* (Schmidt 1986). Until the close of the eighteenth century, "civil society" was employed, following the paradigm laid down by Aristotle, to designate that form of political association conventionally referred to as a "state" or *civitas*. This pattern of usage was taken over without alteration by natural law theorists. But by the early nineteenth century, it had been called into question (Schmidt 1995). Hegel's *Philosophy of Right* made use of a distinction between state and civil society that was unconventional enough to confuse his first reviewers (Schmidt 1982), and Tocqueville's drafts for *Democracy in America* proposed a tripartite division into "religious," "civil," and "political" societies (Schleifer 1980, 7). To speak, then, of civil society (following Hegel) as something distinct from both the family and the state, or (as in Tocqueville's initial drafts) from both religious and political forms of association is to suggest that there are patterns of association not adequately grasped by eighteenth-century political and legal theory. This altered use of "civil society" set the stage for the emergence of the various social sciences that went on to explore the domain carved out by the term.

There was also considerable ambiguity as to just what the proper focus of the newly emerging social sciences might be. Recasting Hegel's distinction be-

tween family, civil society, and the state into a dichotomy between state and society, Stein ([1850] 1964, 50) saw sciences of society—as opposed to sciences of the state—as including the "sciences of economics, of labor, of householding economy and of national economy, of the family and of law." Tocqueville, in contrast, turned from the consideration of the legal structure of the new American democracy to probe the patterns of association, the customs, manners, and mores, the "habits of the heart" that defined its mode of existence. And Marx ([1859] 1970, 20), interpreting civil society as the "sum total" of the "material conditions of life," argued that the "anatomy" of civil society was to be found in political economy. The nineteenth century's uncertainty about the boundaries of civil society continues to be played out today in disputes over whether to include the intimate sphere of the family, whether civil society is reducible ultimately to the market, and whether it is opposed to or requires the existence of the state.

The term "civil society" is unclear in one final respect. It can function either as a normative ideal used to designate the attributes that a political community ought to possess or as an analytic category that is used, within an empirical analysis, to designate a set of "ostensibly 'private' yet potentially autonomous public arenas distinct from the state" that prevent society from "degenerating into a shapeless mass" (Eisenstadt 1992, ix). Locke used the term in the first of these senses when he argued that absolute monarchies are not "civil" societies, since their rulers are not restrained by the terms of the social contract. Social scientists use the term in the latter sense when, for example, they explore the informal networks of association that provide the basis on which political structures arise. Thus, when the term "civil society" is invoked, it is not only often unclear what exactly it encompasses—markets? informal organizations? the domestic sphere?—but also sometimes less than clear whether the author is offering an empirical analysis of an existing social order or postulating a vision of what a good society would look like (Seligman 1992, 201–6).

As a result of the considerable elasticity of both the idea of civil society and the notion of an Enlightenment project, accounts of how the latter affected the former will diverge markedly, depending on the particular choices of the commentator. For example, while Berger and Neuhaus (who see mediating structures as rooted in particular, local circumstances) regard the Enlightenment project as undermining mediating structures (Berger and Neuhaus [1976] 1996, 161–2), Habermas (who understands civil society in terms of a public sphere of citizens engaged in free and open discussions) sees the development of civil society as a fulfillment of the incipient promise of the Enlightenment project (Habermas 1996, 329–87). Hence, any attempt to address the relationship between the Enlightenment project and civil society must first answer: Whose Enlightenment? Which civil society?

⁶ There are notable exceptions. The German term *bürgerliche Gesellschaft* can also be employed as a way of designating a particular historical form of social life, "bourgeois society." Marx made the most of the ambiguity in *The German Ideology* ([1845] 1975, 89): "Civil society as such only develops with the bourgeoisie; the social organization evolving directly out of production and commerce, which in all ages forms the basis of the state and of the rest of the idealistic superstructure, has, however, always been designated by the same name."

KANT ON ENLIGHTENMENT AND CIVILITY

Those who have sought to revive the concept of civil society have generally taken their departure from either Hegel or Tocqueville. They have thus tended to overlook the contribution of a thinker who framed the relationship among civility, enlightenment, and society in a particularly suggestive fashion: Immanuel Kant. Late in 1784, Kant published two essays in successive issues of the *Berlinische Monatsschrift*: "Idea for a Universal History with a Cosmopolitan Purpose" and "An Answer to the Question: 'What Is Enlightenment?'" On first glance, they seem to be pursuing rather different concerns. The "Universal History" essay, Kant explained, was written in response to a note published in the *Gothaische Gelehrte Zeitung*, which mentioned a conversation in which Kant had outlined his ideas on the philosophy of history to a passing scholar. The second essay was prompted by an earlier article in the *Berlinische Monatsschrift*, which had noted that the term "enlightenment" was frequently invoked in the journal but rarely explained and had asked for a definition.⁷ Yet, notwithstanding their diverging subject matter and almost casual character, when read together the two essays provide a remedy for at least some of the confusions that plague current discussions of the Enlightenment and civil society. They (1) offer a definition of the Enlightenment that rests on a novel conception of the "public use of reason," (2) employ the distinction between public and private uses of reason to distinguish civil society [*bürgerliche Gesellschaft*] from cosmopolitan society [*weltbürgerliche Gesellschaft*], and (3) use the perspective of a hypothetical cosmopolitan society as a critical vantage point from which to scrutinize civil society.

Kant's "What Is Enlightenment?" is by now so familiar that it is easy to overlook how novel it was and how theoretically fecund it remains. He defined enlightenment not in terms of what it achieves but by what it escapes: "Enlightenment," the famous opening line proclaims, is "mankind's exit from its self-incurred immaturity" (Kant [1784] 1923, 35). While Moses Mendelssohn's response, published a few months earlier but not seen by Kant, had defined enlightenment as one of the "modifications of social life" that bring a people "into harmony with the destiny of man," Kant measured the advance of enlightenment in terms of the elimination of constraints on the "public use of reason."⁸

In a number of important essays, O'Neill has stressed the significance of Kant's approach. It takes practical reasoning as fundamental and invokes neither perfectionist presuppositions about the proper ends of human action nor metaphysical presuppositions about the validity of human reasoning (O'Neill 1989, 28–50; 1990; 1996). The grounding for practical reasoning must be constructed rather than discovered: Reason, as

Kant ([1781] 1929, 593) insisted in the *Critique of Pure Reason*, "has no dictatorial authority; its verdict is always simply the agreement of free citizens." O'Neill argues that the much-criticized tendency toward universalization and abstraction in Kantian ethics follows from Kant's requirement that practical reasoning must be "followable by those for whom it is to count as reasoning" (O'Neill 1996, 51–59).

Nothing will count as a principle of reason if it demands submission to some unvindicated authority; anything that does count as a principle of reason must be one that all can follow. The principles of reason are those that can secure the possibility of intersubjectivity. Kant does not ground reason in actual consensus, or in the agreement and standards of any historical community; he grounds it in the repudiation of principles that preclude the possibility of open-ended interaction and communication (O'Neill 1990, 194).

Thus, what "communitarian" critics see as the central vice of the Enlightenment—its abstraction from particular, local norms and circumstances—is, for O'Neill, its central virtue. Insufficiently generalized explanations of practical reasoning, which require the acceptance of specific presuppositions or disputable ends, will be less likely to win intersubjective agreement than more abstract accounts of practical reasoning. "There are no general reasons for thinking," O'Neill argues, "that thick act descriptions are more comprehensible than thin ones" (O'Neill 1996, 68n).

Kant's distinction between private and public uses of reason plays an important role in his account of civil society. In "What Is Enlightenment?" he argues that when individuals are engaged in a "private" use of reason—a use constrained by the demands of the positions they hold and the associated duties and responsibilities—they function as "passive" parts of the "machine" of civil society. But individuals are never simply members of civil society. At every moment they are also (if only potentially) members of a "cosmopolitan society," and as members of this community they enjoy a right to the free and unrestricted public use of their reason. As participants in this cosmopolitan society of writers and readers, individuals retain the right to criticize the demands made upon them as members of the civil society in which they reside.

Private uses of reason are limited by presuppositions that must simply be accepted as a condition for occupying a particular post. Kant ([1784] 1923, 38) argues, for example, that a clergyman assigned the task of instructing students in the central beliefs of the faith does not have the right to instruct students in his own diverging interpretation of the church doctrine. Simply because private uses of reason are embedded in ongoing practices and institutions, they will often be more difficult for outsiders to follow than public uses. The latter, simply because they take less as given, will of necessity be framed in a more abstract and universal voice. As a result, civil society confronts its members with a host of local rules and restrictions that simply must be accepted as given. Only when these same individuals conceive of themselves as citizens of a cosmopolitan society will they be in a position to

⁷ For a discussion of the background to Kant's essay, see Schmidt 1989.

⁸ Compare Mendelssohn, "On the Question: What Is Enlightenment?" in Schmidt 1996, 53 with Kant, "An Answer to the Question: 'What Is Enlightenment?'" in Schmidt 1996, 59–60.

examine the rationality of the practices in which they are engaged in their role as members of civil society. The opposition between civil and cosmopolitan viewpoints is thus central to Kant's understanding of the nature of enlightenment.

The opposition of civil and cosmopolitan society had already been deployed, for different purposes, in Kant's "Idea for a Universal History with a Cosmopolitan Purpose," which appeared one month before "What Is Enlightenment?" In the earlier essay, Kant argued that "the greatest problem for the human species, the solution of which nature compels it to seek, is that of attaining a civil society which can administer justice universally" (Kant [1784] 1923, 22). The solution, however, turns out to be "subordinate to the problem of a law-governed external relationship with other states" (p. 24). Justice within civil society cannot be achieved as long as states are engaged in constant preparations for conflict with one another, but—in the famous paradox on which the essay turns—it is precisely the considerable costs of war and the preparations for war that provide the external impetus for states to reform their own constitutions in the direction of republican forms of rule. The driving mechanism behind the entire process is the equally paradoxical notion of "unsocial sociability": the tension, endemic to the human race, of desiring both to live in society with others and to live as an individual (pp. 20–1). Civil society appears in this essay as a domain racked with antagonisms and tensions that provide the impetus for creating a cosmopolitan order, which in turn provides the background conditions needed for attainment of a just civil order. Once again, Kant provides an account of civil society which refuses to downplay the particularity and individuality that rules in civil society, but he also refuses to grant it the last word.

It is difficult to square much in Kant's account of civil society with recent discussions. The imagery he employs in the description of civil society in "What Is Enlightenment?" is hardly appealing: He likens it to a machine, and individuals are but passive cogs in its gearwork. The "Universal History" account of "unsocial sociability" is far removed from the cozy assurance that when "civil society is strong, it infuses a community with its warmth" (Coats 1996, 25). Both accounts also depart from recent discussions by remaining true to the conventions of natural law theory and using state and civil society as equivalent terms.⁹ While those who have taken Hegel, Marx, or Tocqueville as their model have sought to explain changes in political society by

examining the economic and social forces that operate within the domain they designate as "civil society," it is the opposition between civil and cosmopolitan society that is central to Kant's argument. The impetus for changes in the nature of public life comes from individuals learning to think of themselves as members of a society which transcends the individual state, not from individuals framing their actions in response to forces that originate somewhere beyond the family yet short of the state.

The weaknesses of Kant's argument should not be minimized. His example of a military officer criticizing in scholarly journals the policies that he executes on the battlefield (Kant [1784] 1923, 37–8) seems terribly naive after the outrages of the last two centuries. And while he grants (in his discussion of the clergyman whose criticisms of his faith leave him unable to carry out in good conscience the duties demanded by the "private use" of his reason) that individuals may come to a point at which their "public" misgivings necessitate their resignation from their "private" position (p. 38), it is not at all clear how this can be applied to the case of the taxpayer who disagrees with the policies of the government that her taxes support. Must she remain content with letters to newspapers and articles in journals? Does her public use of reason have no means of expression other than the written page? Could it not also take the form of a refusal to pay taxes as an act of civil disobedience in concert with others dissenting from such policies?

But neither should the abiding strengths of Kant's position be underestimated. Nowhere do they become more apparent than in the difficulties faced by theorists who have attempted to derive ethical and legal norms from current conceptions of civil society.

CIVILITY AS A VIRTUE?

For Kant, civil society denotes that form of association proper to a state or *civitas*, a society ruled by laws that pass a universalization test, which requires them to respect the attributes of "lawful freedom," "civil equality," and "civil independence" that citizens possess as hypothetical contractants who agree to subject themselves to civil order (Kant [1797] 1907, 311–6).¹⁰ As such, Kant views civil society as a norm against which states are to be evaluated. By transforming the term into a set of institutions located somewhere between the individual and the state, those thinkers who have sought to define norms of "civility" have typically rejected the sorts of universalization tests to which Kant appealed. A brief consideration of Shils's attempt to describe the virtue of "substantive civility" suggests some of the difficulties encountered by such approaches.

Substantive civility is the virtue of civil society. It is the readiness to moderate particular, individual or parochial interests and to give precedence to the common good. . . . Whenever two antagonistic advocates arrive at a compromise through recognition of a common interest,

⁹ See Kant's equation of "civil condition (*status civilis*)" with the "state (*civitas*)" in *Rechtslehre* §43 (Kant [1797] 1907, 311) and his contrast of "juridical-civil society [*rechtliche bürgerliche Gesellschaft*]" to "ethical-civil society [*ethische bürgerliche Gesellschaft*]" in *Religion within the Limits of Reason Alone* (Kant [1793] 1960, 86–8, 90–1, 93). Seligman (1992, 43), nevertheless, argues that Kant does not view the state as "coterminous" with civil society, since "the publicness of rational debate and critique is seen (and indeed emphasized) as the province of civil society in its distinction from the State." This is difficult to square with Kant's own writings, which consistently equate state and civil society and which see public debate and discussion as evolving within a "cosmopolitan" (*weltbürgerlich*), rather than a "civil" (*bürgerlich*) society.

¹⁰ This is Kant's reformulation of the idea of the social contract.

they redefine themselves as members of a collectivity, the good of which has precedence over their particular objectives. The good which is accorded precedence by that decision might be no more than the continued existence of the collectivity in which they both participate. The common good is acknowledged wherever a more inclusive collectivity is acknowledged.

Every action in which thinking of and attempting to reduce the prospective loss inflicted on one section of a society when another section would benefit from a particular event of policy is an act of substantive civility. It is always possible to consider the consequences of any particular action in the light of its effect on the wider circle within which a decision is made. Every action which bears in mind the well-being of a more inclusive collectivity is an action on behalf of the common good (Shils 1992, 16–7).

There are three immediate problems with Shils's formulation. First, the blanket assertion of the primacy of the good of the "more inclusive collectivity" over "particular, individual, or parochial interests" is fraught with difficulties. Is Shils seriously proposing that any assertion of individual rights against the greater good of the collectivity is an affront to the virtue of civil society? Does the good of a "more inclusive collectivity" always trump the rights of individuals? Second, what sort of metric are agents supposed to apply when they reflect on whether the consequences of their actions will advance the good of the collectivity? What degree of uncertainty about the complex chain of causes that link actions to consequences is tolerable? Finally, Shils's statement that it is "always possible to consider the consequences of any particular action in the light of its effect on the wider circle" raises an obvious question: What falls within "the wider circle"? Should the effect on future generations be considered part of our "common good"? And what of present and future members of other societies?

When contrasted with Shils's attempt to articulate a set of virtues specific to civil society, many of the conventional criticisms of Kant's views on enlightenment and civil society lose their force. Complaints about the Enlightenment's "excessive" concern with individual rights pale in comparison to a concept of civic virtue which, in its embrace of "communitarian" goods, would open the way to state intervention in domains that it long ago vacated, so long as we have assurances that the "public good" is being served. It may be the case, for example, that the enforcement of religious conformity would advance the "common good" of societies with a fair measure of religious homogeneity. But this hardly is a compelling reason for rejecting well-established principles of religious liberty. Likewise, it is by no means clear that an attempt to assess the consequences of actions on a less than clearly defined community gives us any greater guidance than Kant's attempt to construct an account which, by focusing on the intelligibility of practical reasoning, frees us from the necessity of calculating elusive chains of causal connections. Finally, whereas Shils can provide no reason for limiting the scope of ethical concern to a particular civil society, Kant explicitly recognizes that any account of the moral improvement of individual states must of necessity con-

sider the relationship between actions within state borders and those involving the international community.

There are thus good reasons for being suspicious of the well-worn arguments against Enlightenment universalism and the new-found enthusiasm for the virtue of civil society. The Enlightenment project remains too ill-defined a notion to serve as an object either of allegiance or condemnation. What is needed instead is a careful weighing of the variety of different commitments and intentions—not all of them reconcilable—carelessly lumped together under that label. But as has been suggested above, to undertake a critical examination of these different claims is to take up a task which, with less violence to history than other accounts, might well be characterized as the Enlightenment project.

With regard to the current enthusiasm for the virtues of civility, vigilance of a different sort is required. In so far as "civil society" is a category of analysis in the social sciences, the question is whether this new use of an historical term advances our knowledge of the social factors that promote the emergence of democratic institutions. The answer will be decided by the quality of empirical research that the concept fosters.¹¹ With regard to the normative use of the concept, even greater skepticism may be justified. A rich tradition within political philosophy has sought to define civil society—understood as the most general term available for designating that form of association in which public life transpires—in terms of the norms of liberty, equality, and justice. Until we see a more compelling reason for giving preference to the alleged virtues of civility over the stricter demands of justice, we may be forced to second the advice that the Evangelist gives to the Pilgrim in John Bunyan's great allegory: "Mr. Legality is a cheat; and as for his son Civility, notwithstanding his simpering looks, he is but a hypocrite and cannot help thee." And just as the Evangelist advises that "there is nothing in all this noise, that thou hast heard of sottish men, but a design to beguile thee of thy salvation," so, too, we may do well to ask whether all this noise about civility is anything more than a design to turn us away from that concern with justice which lies at the heart of any "Enlightenment project" worth defending.

¹¹ For dissenting views on the analytic usefulness of the category, see Kumar 1993 and Seligman 1992.

BOOK REVIEWS

Political Theory

Opera and Politics: From Monteverdi to Henze. By John Bokina. New Haven and London: Yale University Press, 1997. 240p. \$25.00.

Donald Henderson, *Converse College*

In the words of the author, *Opera and Politics* is "the work of a political scientist, a political theorist who loves opera. Here I use my training in the history of political theory in order to highlight neglected aspects and meanings of works from the several periods of the history of opera: baroque, early classical, late classical, romantic, early modernist, late modernist, and postmodernist" (p. xii).

The chapter headings entice the reader with provocative wording. The first, "The Prince as Death, Beast, and Tyrant: Monteverdi's *Orfeo*, *Ulysses*, and *Poppea*," discusses three operas that "resonate with the characteristic political themes of the age: the contest between fortune and virtue, the simultaneous need to express and restrain the passions, the rival claims of political activism and contemplation, the intoxication with power" (p. 13). In the first opera (1607), Orpheus is seen as the godly prince who must learn a Platonic lesson. After his traumatic loss of Euridice, he learns under the counsel of Apollo the value of contemplation and the ability to rule his passions. Accordingly, the opera ends harmoniously, not with violent death at the hands of the Bacchantes as the myth has it. Bokina interprets this radical revision as the obligatory homage Monteverdi paid to his prince and patron, Francesco Gonzaga.

Then Monteverdi moved to Venice, and the other two operas reflect a different political milieu. In Bokina's view, *Il Ritorno d'Ulisse in Patria* (1641) evokes the Realpolitik of a powerful aristocratic republic in decline. Ulysses, that Homeric prince who uses cunning and bold courage to reclaim his realm, is interpreted as "beast" through a quote from Machiavelli: "The prince must be a fox, therefore, to recognize the traps, and a lion to frighten the wolves" (p. 28). The author argues persuasively that this opera glorifies the illustrious past of a failing republic. In contrast, *L'Incoronazione di Poppea* (1642) implicates the state of civic virtue in Monteverdi's Venice. Hedonism and the passions rule the Roman tyrant Nero, his seductive Poppea, and Venetian society as well.

In "The Dialectic of Operatic Civilization: Mozart's *Don Giovanni*" (1787), Bokina opposes social conformity to the drive for individual freedom, a dialectic which he sees as paramount in Mozart's time. For him, Don Giovanni's insistence upon his libertine life in the face of social censure, divine judgment, and hellfire makes him "a tragic hero" (p. 42). Out of this scenario Bokina formulates his own dialectic, which opposes this view to the text and music of the opera, for neither Lorenzo da Ponte nor Mozart conceived of their libertine as a tragic hero. So the author resorts to the tactics of deconstruction, in which marginal clues in the text yield a contradictory interpretation. Unfortunately, the characters imbued by Mozart with the richest music are now reduced to rigid stereotypes in order to justify a debatable proposition, which elevates Don Juan to *Übermensch*. Nonetheless, the eloquence of Bokina's argument compels the opera connoisseur to reexamine cherished assumptions and see issues of the time as cogent background.

In "Opera and Revolutionary Virtue: Beethoven's *Fidelio*" (1815), the author interprets this opera as "an allegory of the French Revolution, the supreme example of bourgeois re-

publican virtue" (p. 75). His imaginative conception of the heroine, Leonore, enhances Beethoven's opera immeasurably and will give joy to all feminists. At the same time he tends to reduce the supporting characters (again) to melodramatic stereotypes. Beethoven took them seriously, as his music amply demonstrates. In one of the most celebrated ensembles in operatic literature, four of these flawed human beings rise above their petty concerns to express deeper aspirations, as ordinary people sometimes do. They, too, have their place in Beethoven's republic.

I think Bokina rightly conceives "The Utopian Vision of Romantic Anticapitalism: Wagner's *Parsifal*" (1883), despite the traces of racist ideology certain critics have detected in this opera. But Wagner's art is great enough to survive his ideology. Regarding "Wagner contra Nietzsche" (pp. 106–10), however, I do not think Nietzsche "misinterpreted" Wagner's intentions in *Parsifal*. The ideology of renunciation (Christian or otherwise) and the central role of tortured guilt in this opera revolted Nietzsche because they represented to him a retreat from life and Lust (joy, desire, delight, pleasure, and so on). Then, Wagner's conception here of Woman as Biblical temptress—fallen, yet penitent and submissive to male authority—cannot please everyone. Nonetheless, one can be uplifted by the aura of Utopian transcendence in Wagner's music, especially in the "Good Friday Spell" and the final scene. After Wagnerian Utopianism, "The Politics of Psychological Interiorization: Strauss's *Elektra* and Schoenberg's *Erwartung*" (both 1909) plunges us into a world of psychic disorder, evoked by a distorted, distended musical idiom, which Bokina interprets as a retreat from political disillusionment into the inner world of first causes.

The next chapter addresses "The Aesthetic Politics of German Artist-Opera" in Hans Pfitzner's *Palestrina* (1917), Paul Hindemith's *Mathis der Maler* (1938), and Arnold Schoenberg's *Moses and Aron* (1932). All three composers wrote their own librettos, and they identify with the protagonists they create. In Pfitzner's "musical legend," the composer Palestrina is threatened with imprisonment and torture unless he produces a stirring liturgical work, in the great tradition of Roman polyphonic church music, for political purposes at the Council of Trent. Depressed for various reasons and unwilling to compose on demand, he refuses to comply. In his darkest moment of despair, then, comes the light of musical inspiration. Moved by this ineffable source of creativity, not by political coercion, he creates a definitive masterwork that vindicates and gives new life to the tradition which nourished his art. Pfitzner saw himself in analogous terms. He sought to vindicate the great tradition of German romanticism in music and further its evolution, not "freeze" it, as Bokina claims (p. 165). External pressures, such as the fashionable modernism of the Weimar Republic or the demands of Nazi Kulturpolitik never swayed him. Daunted at times and depressed, he continued to go against the tide. He was hardly the victim of "passive acceptance" (p. 165). Why Bokina thinks *Palestrina* and its creator exude resignation is hard to understand. Palestrina is shown in the final scene of the opera exhausted by his monumental achievement but serene and fulfilled, as text and music tell us. Pfitzner knew resignation in the face of drastic upheaval, but he always rebounded with bursts of creative production and fierce polemics against radical modernism. *Palestrina* displays much in common with the ideas behind Hindemith's *Mathis der Maler*, which relates the painter Matthias Grünewald (c. 1480–c. 1530) to the social turmoil of his time.

I agree with Bokina's assessment of Schoenberg's *Moses und Aron* as "impotence in modernist opera" (p. 154). The author sees Aron as the embodiment of artistic impotence,

but I think Schoenberg's radical modernism is the fundamental problem. Schoenberg, like Moses, considered himself a law-giver. His "commandments" are revealed in the twelve-tone method (his solution for music in the future), a totalitarian system of pitch relationships which scrambles traditional musical syntax and thereby severely limits expressive range and dramatic differentiation. In *Moses und Aron*, the method fails to sustain the action, and the final act consists of spoken text only. Instead of the promised land, it leads to a dead end.

Bokina's admirable synopsis and compelling interpretation of Heinz Werner Henze's *The Bassarids* (1986), a postmodernist reworking of the Apollo versus Dionysus theme in a political context, makes me want to know this opera better. Here, the "aesthetic-politics" of Henze draws eclectically from traditional styles and procedures, reaffirming the past in ways that might have reassured Pfitzner.

Thank you, John Bokina, for this rich feast of provocative ideas on that extravagant art form called opera. Those who malign it with the epithet "What is too silly to be said may be sung" (attributed to Dr. Johnson) henceforth had better eat their words.

Cornerstones of Peace: Jewish Identity Politics and Democratic Theory. By Marla Brettschneider. New Brunswick, NJ: Rutgers University Press, 1996. 201p. \$48.00 cloth, \$16.95 paper.

The Narrow Bridge: Jewish Views on Multiculturalism. Edited by Marla Brettschneider, with an introduction by Cornel West. New Brunswick, NJ: Rutgers University Press, 1996. 291p. \$48.00 cloth, \$18.95 paper.

Jennifer Ring, *University of Nevada, Reno*

Each of these volumes addresses the often overlooked place of American Jews as a complex of interests in American politics and as a part of the dialogue on multiculturalism.

Cornerstones of Peace is a critique of contemporary theory on interest groups, using American Jewish groups and their relation to Israel as case studies. Brettschneider's point of departure is her objection to the expectation that all Jews comprise one group with a unified interest. The misconception is reinforced by America's liberal worldview, which regards interest groups as individuals: In a Hobbesian model, each is isolated from and competing with all other interests. Brettschneider observes: "Mainstream politics in the United States . . . has long operated within a paradigm in which atomistic, competitive, and self-interested behavior is most likely rewarded" (p. 6).

The tendency to treat "Jewish interests" as monolithic and at odds with other American interests has been encouraged by Israel and reinforced by Jewish lobbyists in America. Political positions are dichotomized as either for or against Jewish or Israeli interests, with no regard for diversity or pluralism within the Jewish community in America and elsewhere. Brettschneider's volume is intended as a corrective, both politically and theoretically.

Politically, the book describes the emergence since the 1970s of Jewish interest groups in the United States seeking alternatives to blind support of Israeli policies, resisting the accusation that all protest reflects "Jewish self-hatred" and fuels support for Israel's enemies. These new Jewish activists are no less committed to their Jewish identities and to the need for Israel to exist than are the more powerful lobbyists who contributed to the exaggerated polarization into friends and enemies of Israel. "When rank-and-file Jews expressed . . . dissenting opinions, they were virtually disinvited from

the Jewish community. When Jewish leaders tried to do so, they were delegitimized. When Jews with such opinions had tried to come together organizationally in years past, their group was destroyed" (p. 5).

Brettschneider thus offers a political history of the recent struggles for alternative voices in the Jewish community to be heard, while confirming the unity within that diversity: There is a Jewish community. "It is possible to see that the Jewish community is a community, a unity, with all of its difference. . . . The apparently monolithic voice of Jewish leadership has always embodied dissent" (p. 36). Yet, that dissent does not undermine "an understanding of the cluster of groups involved in the creation and re-creation of pro-Israel identity in relation to one another" (p. 57). Brettschneider refers to this tension as dialectical: "multiple, fluid, and changing" (p. 37).

This corrective and progressively driven alternative vision to Jewish politics in America is important, and it is likely to become more so as current right-wing extremist politics in Israel are played out. American Jews, many of whom have profound religious and political disagreements with Jewish religious fundamentalists in Israel, cannot be dismissed as disloyal Jews or as having anything less than a profound stake in the future of Israel. Their political positions cannot be dictated by Israel, nor will they constitute a unified front in the United States.

Brettschneider offers a promising vision for America in a multicultural age, refusing to accept Madison's definition of factions as inherently parochial and antisocial: "We can understand better the concrete obstacles faced by the alternative Jewish groups when we realize that the problem of a politics based on the notion of self-interest is that it tends to squelch diversity behind a mask of the 'common good' supposed to transcend our 'particulars'—or differences—resulting in a closed political space" (p. 37). She makes a plea to reject the "Hobbesian" basis for a politics of fear: "Perhaps the most important time for open honest dialogue within a community is during a time of crisis" (p. 47). Given the very real fear of annihilation that has driven Jewish politics in the late twentieth century, this seems like a tall order.

The weakest aspect of the book is its theory. While the discussion of Jewish interest-group politics is informative and important, the continual return to discussion of Hobbes, Mill, Madison, Bentley, and, somewhat discordantly, Seyla Benhabib and Martha Ackelsburg is belabored and distracting, rather than useful to our understanding of Jewish politics in America. The application of theory remains superficial, not well integrated into the political discussion. It is not that Brettschneider is either wrong or inaccurate in her discussion of democratic theory; it is simply unnecessary to use Thomas Hobbes in order to understand Jewish politics in America. Does Brettschneider mean to say that only the American political structure is at fault for seeing the world as warring Hobbesian individuals, thus distorting historically pluralistic Jewish politics? Or does she implicate Israel as well? For Brettschneider is as concerned by Israel's ability to control American Jewish politics as she is by American Jews' response to their own liberal individualistic political culture. And, surely, she cannot mean that Thomas Hobbes and James Madison have had a profound influence on Israeli politics?

Finally, is Brettschneider's apparent need to discuss Hobbes, Mill, and Madison before talking about anything else in American politics itself assimilationist? Does this volume exemplify that, before granting the doctorate to a student writing about Jewish politics in America, the American

political science establishment demands for legitimacy a demonstrated familiarity with a handful of European male thinkers? The result is that an original thesis such as Brettschneider's strains to include political theorists whose fit with her discussion is problematic. It diminishes the work, and it should make us think hard about what the profession demands of doctoral dissertations.

The Narrow Bridge continues the discussion of Jewish pluralism and Jewish multiculturalism, but without the distraction of Anglo-American political theory. It is a rich and intense volume, addressing issues of: diversity within the Jewish community, especially class and sexual orientation; possibilities for dialogue between Jews and other ethnic and racial minorities; Judaism as a part of multicultural education at both schools and universities in America; and the challenges of including Jewish representation as an aspect of political and social action. Some of the essays are stunning. Bob Goldfarb's short piece, "Lesbians and Gays in the Jewish Community," is one of the best I have read on this controversial subject. He powerfully addresses the challenges to including these groups in all aspects of Jewish religious life, by confronting and interpreting sections of the Torah and Talmud that have been used throughout the millennia of Jewish history to condemn male homosexuality. (The argument against lesbianism is less problematic, since traditional Jewish sources rarely even acknowledge female sexuality in their rush to exclude all women from the most sacred and respected aspects of Jewish life.)

Felice Yeskel's discussion of the taboo of social class deals with anti-Semitic misconceptions of Jewish wealth. Martha Ackelsberg addresses Jewish feminism in the context of feminist literature on coalition-building.

Two essays on Jewish relations with African Americans, dealing with early involvement in the Communist Party (Gerald Horne) and the civil rights movement (Melanie Kay/Kantrowitz), provide insightful historical background on this troubled relationship. Naomi Nim's account of her experience as a cotrainer, along with an African-American woman, in an antiracism, antioppression session for a primarily white Protestant woman's group touches upon Jewish conflicts about acknowledging anti-Semitism and Jewish deference to the presumption of the "greater oppression" suffered by African Americans. Other contributions with more practical applications make the volume a valuable sourcebook.

Apart from my sense that the volume may attempt to cover too much territory, I have only one complaint: the unquestioned correlation of oppression with material poverty. All the contributors accept poverty as the "worst" form of suffering. Without diminishing the seriousness or severity of material deprivation in America and elsewhere, I would have appreciated an acknowledgement of the feminist position, that oppression is not always visible. To privilege material suffering over the less tangible psychological oppression characteristic of racism, sexism, and homophobia is to accept conventional wisdom and to miss a dimension of prejudice that has contributed to the exclusion of Jews from multicultural dialogue.

God and Man in the Law: The Foundations of Anglo-American Constitutionalism. By Robert Lowry Clinton. Lawrence: University Press of Kansas, 1997. 293p. \$35.00.

Robert P. Kraynak, *Colgate University*

The opposition to judicial activism is a growing movement that no longer can be ignored by politicians and legal scholars. President Clinton has felt its power in the determi-

nation of a Republican Senate to leave vacancies on the federal bench rather than fill them with activist judges. A respected journal, *First Things*, published a polemical attack on "the judicial usurpation of politics" (November 1996) that immediately provoked a debate about how far the judiciary has gone in undermining American democracy. Over the last thirty years, many critical studies have been written by influential scholars, such as Alexander Bickel, Robert Bork, Raoul Berger, Christopher Wolfe, Stanley Brubaker, and Jeremy Rabkin. To this list, one may add Robert Clinton, a self-described conservative who has written two impressive books on the problem of judicial activism.

In his first book, *Marbury vs. Madison and Judicial Review* (1989), Clinton exposed the myth of judicial supremacy that has grown up around *Marbury* and proposed "coordinate review" by all branches as a way of breaking the monopoly of the courts on judicial review. In his second book, *God and Man in the Law*, Clinton argues that judicial activism cannot be overcome without a proper understanding of the higher law foundations of the Constitution.

To show the continuity of his thinking, Clinton begins *God and Man* with a summary of his earlier work. He emphasizes the fact that the Supreme Court did not explicitly claim supremacy over the other branches in interpreting the Constitution until 1958, when the Court said in *Cooper versus Aaron* that its judgments were final (pp. 13, 27). Until that time, Clinton argues, the other branches had interpretive roles; finality was left unspecified, permitting the checks and balances of the separated powers to work as the Framers intended, without one branch dominating as a matter of principle. Clinton's advice is to return to the pre-*Cooper* practice, which would give finality to the judiciary only in cases pertaining to judicial functions. In addition, he recommends that all branches follow the rules of interpretation derived from English common law: Stick to the literal meaning of the text as intended by the lawgiver, unless it is absurd in the present context or requires exploration of the remedial intention of the law (pp. 111-6).

But Clinton is quick to admit that rules of interpretation, especially ones that sound like "original intent" or conventionalism, are insufficient to overcome judicial activism. In fact, it was precisely the accusation of being a conventionalist (made by Soterios Barber in reviewing his earlier work) that inspired Clinton to write his new book. Here, Clinton states explicitly that he opposes judicial activism not merely because judges are ignoring the text and usurping power but because they are making law according to their subjective preferences, unconstrained by objective standards of truth or goodness.

Following the lead of Eric Voegelin, Clinton traces the subjectivism of judges to the spiritual crisis caused by the death of God and the loss of belief in cosmic moral order. He uses Voegelin's concept of "gnosticism," or deformed spiritual knowledge, to describe the crisis, arguing that judicial activism is nothing less than "the gnostic replacement of God with man as the ruler of the legal cosmos" (p. 218). What Clinton means is that judges who lack belief in God and transcendent order inevitably fill the void with their own willful assertions or with degraded, materialistic views of man.

Clinton's remedy is a return to the foundations of the Western legal tradition, which he understands to include four propositions: the belief in God as the creator of the cosmos and the providential ruler of human affairs; the belief in an immaterial mind or soul in man that can grasp objective reality; the belief in natural law as a norm for human or constitutional law; and the belief that constitutional law emerges from natural law, not through imposition of abstract

principles but through the consensus expressed in custom—known to us as the English common law (pp. 221–2). For Clinton, this set of propositions was best stated and defended by Thomas Aquinas, which makes his proposal a brand of Thomistic jurisprudence.

Obviously, Clinton's attempt to overcome judicial activism in this fashion is extraordinarily bold and ambitious. While he argues persuasively that recovering the traditional Western belief in transcendent moral order is necessary, I am not sure that he has put the pieces back together properly and formed a coherent and workable theory of law that descends from God, to natural law, to common law, to American jurisprudence. I see at least three problems with his argument.

The first concerns God. Clinton shows remarkable intellectual courage in devoting two whole chapters (15 and 16) to proofs for the existence of God, derived from the distinction made by Aquinas and Adler between necessary and contingent being. I thought these chapters showed flashes of brilliance, and they may even lead agnostic or atheistic judges to reconsider their doubts about God. But Clinton does not really establish a link between God as the necessary being who creates the world and God as the providential ruler of human affairs. Much more is needed to establish that link, by analyzing either the Bible's political teaching (as Augustine did), or the providential features of natural law (as Aquinas did), or the providential design of historical evolution (as Burke did).

The connection between English common law and American constitutionalism is also not sharply drawn. Clinton devotes only a few pages to discussing the evidence for his controversial claim that the Constitution is largely a product of the English common law. He argues that the first four articles contain numerous provisions and phrases that are "directly traceable to English sources" (pp. 96–9). But the English common law system as a whole establishes a constitutional monarchy, while the Constitution establishes a republic. Though both may aim at "ordered liberty," Clinton's analysis misses the distinctive American blend of English common law, reformed Protestantism, Lockean natural rights, and Madisonian republicanism.

A third problem is the actual link with American jurisprudence. It is not clear how one is supposed to apply Clinton's grand theory to concrete cases of American law. Nor is it clear whether it could be applied without spawning a new kind of judicial activism. I think the missing ingredient in Clinton's work is an understanding of prudence, a type of practical reason that combines legal conventionalism and higher law. Prudence enables one to follow precedent in ordinary decisions because the procedure itself is an imperfect approximation of a higher law of virtue; but prudence also counsels one to refrain from invoking the higher law justification most of the time in order not to tempt the lust for power that constitutionalism tries to control. I am sure that such a prudential combination of positive law and higher law is Clinton's primary goal; but we must await volume three of his collected works to see it fully elaborated.

Habermas and the Unfinished Project of Modernity: Critical Essays on *The Philosophical Discourse of Modernity*. Edited by Maurizio Passerin d'Entrèves and Seyla Benhabib. Cambridge, MA: MIT Press, 1997. 305p. \$35.00 cloth, \$17.00 paper.

Marie Fleming, *University of Western Ontario*

This volume of essays takes its title from Jürgen Habermas's well-known address, "Modernity: An Unfinished Project." Habermas gave the talk in September 1980 upon accepting

the Theodor W. Adorno Prize from the City of Frankfurt, and he brilliantly used the occasion to defend modernity as a project for the future. He was concerned about three types of conservatives: traditionalists who value the cultural integrity of a period prior to modernity; neoconservatives who promote technological progress and capitalist growth; and such contemporary theorists as Michel Foucault and Jacques Derrida, whom he regarded as wishing to break with modernity altogether. According to Habermas, antimodern conservatives like Foucault and Derrida evoke the aesthetic principle of will to power or Being itself to show opposition to instrumental rationality, but they only repeat the mistakes of aesthetic modernity when they undervalue modernity's cultural potential for rationality. As interest grew in Jean-François Lyotard's claims about a "postmodern condition," Habermas continued to hold that poststructuralist theories were theoretically inadequate and politically conservative, and he argued that shifting to a communicative understanding of rationality would allow us to view modernity in a positive light. He pursued these themes in several lectures, and in 1985 they formed the core of a book, *The Philosophical Discourse of Modernity*.

Maurizio Passerin d'Entrèves and Seyla Benhabib, editors of the volume under review, provide the first complete English translation of Habermas's 1980 talk and bring together a series of essays on his 1985 book. Those by Jay M. Bernstein, Fred Dallmayr, David Couzens Hoy, Christopher Norris, and Joel Whitebook appeared some years ago in *Praxis International*, while those by James Bohman, Diana Coole, David Ingram, and James Schmidt are new.

Specialists will be pleased to have the collected views of this impressive group of established scholars, but even they may wonder about the precise connections among these essays. The introduction by d'Entrèves consists mainly of lengthy summaries of the arguments of the individual authors and does not give the needed analytical overview. To be fair, he does suggest that the issues separating Habermas and the postmodernists can be understood in terms of two different understandings of responsibility. Thus, whereas "Habermas privileges the responsibility to act in the world in a normatively justified way, the postmodernists celebrate the responsibility to otherness, namely, the openness to difference, dissonance and ambiguity" (p. 2). This discussion is much too brief, however, and not altogether satisfactory. It is also striking, given the title and implied aims of the volume, that d'Entrèves does not say why we should be so concerned about the "unfinished" project of modernity. Why should we want to think about modernity as unfinished rather than finished? Neglect of this question in the introduction is unfortunate, because what is missing in the individual essays is precisely what the volume as a whole promises—serious and engaged insight into what should be said, in the late 1990s, about the "unfinished" project of modernity.

On a straightforward reading of the majority of the essays, one might be tempted to conclude that Habermas's question is simply wrong-headed. As Schmidt suggests, there is indeed a troubling neatness and directionality in his argument. Habermas interprets post-Kantian philosophical discourse, from Hegel and Marx, to Nietzsche and Heidegger, to Foucault and Derrida, as grappling unsuccessfully with the principle of subjectivity; he sees post-Nietzschean and post-Heideggerian thought as reproducing the dilemmas of subject-centered reason; and he gives his own model of communicative rationality as the obvious solution. As well, several authors rightly object to his tendency to minimize the ambiguities and tensions in the different thinkers. According to Dallmayr, Habermas tends to project onto Hegel, Nietzsche,

and Heidegger the very contradictions he claims to be finding in their thought. Norris argues that he misreads Derrida and fails to see that deconstruction actually belongs to the philosophical discourse of modernity. Similarly, Schmidt argues that Habermas repeatedly misunderstands Foucault, and Whitebook maintains that his attack on Cornelius Castoriadis, who cannot be consigned to the postmodernist camp, reflects divergent theoretical agendas motivated by different understandings of psychoanalysis.

These authors indicate where Habermas's reconstruction of modern philosophical discourse is limited and why he is not always reliable on Hegel, Nietzsche, Heidegger, Derrida, Foucault, and Castoriadis. They also show why his arguments do not lead straight to his communicative model, as he claims. Nonetheless, the idea of an "unfinished" modernity, which is not identical with Habermas's reconstruction of philosophical discourse, endures. It also persists despite Jay Bernstein's excellent critique of his procedural view of communicative rationality. For Bernstein, discourses that resist separation from the body, *différance*, and the nonidentical point to a local and comprehensive reason that is continually at risk of being silenced by the operation of both instrumental rationality and procedural communicative rationality. This piece and the others are intrinsically interesting, but for the most part they reflect the mood and theoretical commitments of the late 1980s, when the modernity/postmodernity dispute seemed more urgent.

To be sure, there are also indications of a desire to move on. Hoy suggests that we "split the difference" between critical theory and deconstruction and work through suspect oppositions like history and theory, modernity and postmodernity. The more recent essays also explore some new territory. Bohman maintains that critical theory can respond more positively and effectively to poststructuralist theories of language by resisting Habermas's restrictive understanding of world-disclosure. Coole wants critical theory to be attentive to otherness and argues that the formal procedures of discourse ethics must be supplemented by a politics of alterity. Ingram identifies areas of considerable agreement in Habermas and Lyotard and maintains that each philosopher understands justice in terms of the dialectic of enlightenment and that each, in different ways, seeks a solution in Kant's notion of aesthetic judgment.

I came to this volume expecting to find focused discussion on how to understand the "unfinished" project of modernity. In retrospect, it was perhaps because of what was missing that I began to think all the harder about modernity. I conclude that Habermas's question, first raised in 1980, not only survives the philosophical controversies of the past two decades but also is more important than ever before.

The Power of Identity: Politics in a New Key. By Kenneth Hoover. Chatham, NJ: Chatham House Publishers, 1997. 160p. \$19.95.

Mary Caputi, *California State University, Long Beach*

The field of psychology has much to offer political theory, for it makes possible a venue of analysis which, while pertinent to political life, often remains opaque to even the most rigorous empiricist. All of us prefer to think of the political sphere as the by-product of calm Rawlsian reflections and considered judgments; we like to imagine that the public arena showcases our most noble and praiseworthy characteristics, just as Aristotle said. Yet, more often than not these are wishful notions. Inasmuch as psychology insists that visceral emotions and irrational impulses inform political life, sully an

otherwise pristine reading of things, it offers an invaluable contribution to the discipline. Psychological insight clarifies the degree to which unresolved internal conflict comes alive in the public arena, giving expression in frequently sanctioned ways to the hatred, rage, desire, and ambivalence that, if unbridled, can prove ruinous to any collective.

Should this emphasis on our less palatable impulses be minimized, psychology's contribution to political analysis takes on an entirely different cast. When the former abandons the deeply conflicted dimension of psychic life in favor of a more common-sense approach to things, when it overlooks the raucous emotions and unsettled feelings that characterize internal reality, something is lost in the scholarly enterprise. The latter flattens out into a problem-solving mission, a trouble-shooting exercise whose intellectual pursuit has been diminished by the very precepts that inform it. Indeed, combining the psychic and social spheres should not profess to smooth out the rough edges of political life, for psychological insight does not lend an optimistic reading to every situation.

Kenneth Hoover's *The Power of Identity* may be faulted for such a display of optimism. The efforts to bring Erik Erikson's developmental psychology to bear on identity politics surely have the feel of affirmative resolution and ironed-out contradictions; at the extreme, Hoover's recommendation of this developmental approach lacks critical distance, and he stands too ready to offer solutions to complex social issues that have long plagued the public sphere. Indeed, the author's argument glistens with conviction where Erikson's usefulness is concerned; it assumes too readily and in too upbeat a fashion that the developmental venue translates easily into a viable political agenda. Hoover's enthusiasm is commendable, of course, but the reader cannot help but feel that a more captious, incredulous, steely-eyed reading of Erikson is warranted given all that he is credited with delivering.

Taken alone, however, such criticism is excessively harsh. There are meaningful ways in which developmental psychology enriches our approach to identity politics, and Hoover succeeds admirably in presenting a comprehensive overview of what these are. A skilled writer and erudite scholar, Hoover expounds upon two concepts that keynote Erikson's work. One is the conviction that while the content of human identities may vary—while race, gender, sexual preference, and other categorizations may separate us—the process of identity formation itself unfolds along similar lines for us all. This unfolding creates parallel dimensions of human experience, a common basis to which we can all relate. To use Erikson's technical terms, identity formation necessarily includes the components of "integrity," "competence," and "mutuality"; no contextual caveat or mitigating specificity can vitiate the uniting force of these universal elements. Against the drift of much scholarship in identity politics, then, Erikson's theory casts aspersions upon the claims of incommensurability, thus making trouble for the incongruity so paramount to postmodern pastiche and for the celebration of difference so integral to multiculturalism.

The universalist component of Erikson's theory thus allows for a tolerance that our sustained and deliberate attention to difference might preclude. Yet, before a tolerant disposition can emerge, Erikson argues, the experience of cohesion with one's cohort must occur. Only the early, initial experience of integration into a familiar community can later breed the ability to recognize parallel dimensions of human experience: The ultimate goal of peaceful coexistence thus demands a more symbiotic precursor. "Unless individuals acquire strength from some source of cultural support, they will have

a very hard time rising above the parochialities of a particular background to achieve a measure of tolerance" (p. 37). This is the second component of Erikson's theory upon which Hoover draws. The author then deftly expounds upon the political implications of this assertion, for the prescribed "cultural support" surely raises a host of political questions, thereby pointing directly to the connection between developmental psychology and the social sphere.

It is the task of democratic systems, Hoover argues, to allow integrated communities to flourish, to foster cohesive enclaves which in turn breed tolerant citizens. Only within such contexts can the complexities of identity politics be accommodated, thereby discouraging the bigotry and violence which alternative political regimes may unwittingly encourage. Developmental psychology thus resonates deeply with the democratic process; in particular, it offers a welcome alternative to the sometimes vaunted problematics that swirl around identity politics by proposing an end to incommensurability's impasse.

Yet, as stated, the precise manner in which the theory may be applied remains insufficiently explored in the book, leaving the vicissitudes of its practical contribution somewhat obscure. While *The Power of Identity* unequivocally endorses developmental psychology for the study of identity politics, it leaves undeveloped some of the central questions that would surely animate any effort to bring the former into the social field. Hoover is a sophisticated thinker who rightly warns against allowing identity politics to devolve into a naive humanism. Yet, his own project would benefit from a more hard-edged incredulity, the kind that breeds a sustained critical inquiry marked by query and hesitation.

The Self at Liberty: Political Argument and the Arts of Government. By Duncan Ivison. Ithaca, NY: Cornell University Press, 1997. 213p. \$39.95.

Peter C. Myers, *University of Wisconsin, Eau Claire*

Duncan Ivison sets out to accomplish two general tasks in *The Self at Liberty*. First, he means to challenge Sir Isaiah Berlin's famous dichotomous conceptualization of liberty along with its most influential contemporary variants. More affirmatively, by challenging rigid oppositions of negative to positive liberty, of liberal to republican, and juridical or deontological to perfectionist forms of political theory, Ivison seeks to enhance our historical understanding of the character- or identity-forming arts of government that liberal as well as republican regimes practice. Second, he means to employ this enhanced understanding to prepare us to think critically and imaginatively about the sorts of governmental arts and conceptions of self and citizen that we might endorse. This is an interesting and ambitious undertaking in both its parts, although one may judge the first, to which the author devotes the far greater part of his energy, more successful than the second.

Ivison's presentation of his argument can be conveniently divided into three sections. The first, comprising chapters 1 and 2, describes and defends the author's interpretive approach, which consists generally of an amalgam of the historical (linguistic-contextual) and critical approaches of Quentin Skinner and Michel Foucault. In the second section, comprising chapters 3–6, Ivison employs his historical-critical approach to reexamine major elements of our republican and liberal heritage. The major figures in these chapters are Machiavelli, Locke, and Rawls, who appear as chief representative of the classical republican tradition and the "natural-law" and "political" variants of modern liberalism, respec-

tively. The general aim is to show that Machiavellian republicanism bears a closer similarity to each of these major strands of modern liberalism than scholars of either have consistently recognized. As Machiavelli displays a modern concern for domestic and personal security along with his classical devotion to active civic liberty, so Locke "fits comfortably into the category of a theorist of civic or political virtue," despite his forensic conception of the person and his hedonist psychology (p. 133). Likewise in Rawls, Ivison focuses on how the regime of political liberalism—having evolved from its neutralist incarnation—depends upon and seeks to foster a specific set of virtues and moral powers in the persons whom it would govern. In the third and briefest section, which consists of the concluding chapter, Ivison moves from historical investigation to the question of political legitimacy and seeks especially to imagine different objects and arts of government from those elaborated in earlier chapters (p. 162). Radicalizing Rawls's moral pluralism and appropriating the Machiavellian notion that a contestation among divergent "humors" helps sustain republican vitality, Ivison imagines a liberal republic that begins by recognizing the "deep diversity" of its constituents and therefore makes its binding principles the subject of continual negotiation and renegotiation (p. 168).

Various sorts of readers should find the book a useful addition to the growing body of scholarship affirming a republican-liberal synthesis. With respect to its historical-interpretive arguments, the book breaks a bit of new ground, but it mainly synthesizes and refocuses an important and ongoing controversy. Ivison has read widely and displays an impressive grasp of the extensive literatures in the various fields that he surveys. Readers sympathetic to the Skinnerian approach in particular should find in his book a useful synthesis of a mass of historical literature, although they and others may not always accept his interpretive findings. Readers sympathetic to perfectionist liberalism as well as those with postmodern inclinations should, for their different reasons, find the book a useful exposition of the liberal concern for character formation, and they should find provocative his concluding sketch of an alternative strategy of liberal governance.

The argument seems to me exposed to two general lines of objection. First, Ivison's historical interpretations require stronger defenses against the major alternatives. The need is especially visible in his readings of Machiavelli and Locke. The political thought of Ivison's Machiavelli is a house divided, harboring mutually hostile classical and modern elements. Acknowledging that Machiavelli's concern for balancing the divergent "humors" that appear in all republics runs clearly contrary to the Aristotelian-Ciceronian insistence upon civil concord, Ivison yet declares that Machiavelli "remains by and large within the [Aristotelian] mixed constitution tradition" (pp. 66–7). It is possible, of course, that Machiavelli's mind is divided in this decisive respect, but there is a considerable body of scholarly argumentation in defense of the contrary thesis, to which Ivison, the breadth of his reading notwithstanding, devotes barely a mention. That he should give it more serious consideration appears especially advisable in view of Machiavelli's well-known acknowledgment of his own and admiration for others' artful misdirections, as well as his preoccupation with innovation and his teaching that successful innovation often requires the presentation of the new in the guise of the old. If he had paid due regard to the possibility that Machiavelli is a more radically innovative and coherent thinker than it may appear on the surface, then Ivison would have presented a more defensible

account of Machiavellian republicanism and of its relation to modern liberalism.

The case is similar with respect to the author's treatment of Locke. Although his welcome discussion of the Lockean "art of governing men in society" yet leaves room for a more comprehensive account of that art, Ivison's treatment of the design of Locke's proposed poor-law reforms represents a useful and interesting contribution (pp. 122–30). Still more interesting and provocative is his attempt to reconceive the relation of the right to the good in Locke. This attempt seems to me in principle defensible but in its particulars not fully persuasive. Paying insufficient attention, for instance, to Locke's crucial individualist qualification of his affirmation of the duty to preserve mankind, Ivison contends problematically that the common or public good simply supersedes the claim of individual rights in Locke (pp. 101–8). This failure to see the extent of Locke's commitment to the individual's good and rights is related to a failure to think through the foundations of Locke's political philosophy. At once ascribing to Locke a theological foundationalism and observing that Locke's theological arguments may be dispensable at least for some members of society (pp. 99, 119–21), Ivison fails to inquire very probingly into Locke's conception of the good or happiness that a truly rational liberty and a truly rational government would serve.

In these two cases especially, Ivison's readings would benefit by a greater effort to take seriously their subjects' philosophical aspirations, an effort that appears precluded by his sympathy for Skinnerian methods. It is regrettable that even as he affirms the virtues in contestation and defends the Skinnerian approach as enhancing our capacity for self-criticism, Ivison endorses virtually without argument a dismissive caricature of a major alternative, one which could supply some of the defects of his own approach, as "the 'present-timeless' or 'pen-pals' approach" to the study of political thought (p. 12).

The second general line of objection concerns the viability of the reconceived liberalism that Ivison's historical argument is meant to prepare. By exposing the contingent, contestable character of our identities and therewith the depth and legitimacy of the fact of moral-political pluralism, Ivison hopes to persuade us of the importance of submitting our binding civic principles to negotiation. He recognizes not only the need for civic consensus but also that the premise of deep diversity "makes agreement more difficult" (p. 165). He does not seem, however, to appreciate the true depth of the difficulty, which lies in the very attempt to construct a viable liberalism on Foucaultian (or, ultimately, Nietzschean) premises. If the self is truly decentered, then how can the determination of identity be other than an effect of mere contingency and arbitrariness, or of accident and force? On the same premise, what reason can there be for a good-faith negotiation among selves, based upon a respect for the dignity of the selves with whom one negotiates, as distinct from a reluctant acquiescence in a *modus vivendi*, which Ivison renounces? If philosophy is to be understood as critique alone and freedom as mere negation or transgression (pp. 27–8), then by what reason could we affirm the legitimacy of any particular settlement among contesting parties? What is needful is a fuller explanation of how, within this theoretical framework, we can find a space for rational liberty that involves neither a restless, quixotic struggle for liberation nor a submission to political or social necessity (cf. pp. 166–7).

The Self at Liberty admirably raises our critical awareness of the arts of government that shape us even in liberal societies. But it contributes also, despite itself, a reminder

that the enterprise of political philosophy requires not only our intrepid critique of the conceptions of the good that we do affirm but also our dialectical ascent toward a better understanding of the conceptions of the good that we should affirm.

Finding a New Feminism: Rethinking the Woman Question for Liberal Democracy. Edited by Pamela Grande Jensen. Lanham, MD: Rowman & Littlefield, 1996. 304p. \$67.50 cloth. \$24.95 paper.

Reconstructing Political Theory: Feminist Perspectives. Edited by Mary Lyndon Shanley and Uma Narayan. University Park: University of Pennsylvania Press, 1997. 246p. \$45.00 cloth, \$17.95 paper.

Renee J. Heberle, *University of Toledo*

The first collection under review, *Finding a New Feminism*, offers a series (interrupted only by Jean Elshtain's essay on the Mothers' Movement in Argentina) of interpretations of canonical Western political thought that assume the end of feminism: a resolution of the "equality/difference debate," or what the subtitle anachronistically calls "the woman question." These essays argue that the equality/difference debate is already resolved for liberal democracy within the canon of political theory. They argue that the treatment of women by authors of canonical texts indicates a normative commitment and sympathetic attention not only to "woman's" role as she sustains community but also to women's roles as powerful individuals, thus establishing the proper balance between the conflicting values of equality and difference. The second collection under review, *Reconstructing Political Theory*, furthers the well-established but necessarily ongoing project of revising political theory to take feminist perspectives and issues into account. The essays challenge both traditional and feminist constructions of concepts already taken to be political, while further arguing that discussions of the political must take into account issues typically constructed as private concerns, such as dependency, family, children, woman abuse, and compassion.

Most feminist discussions of Western political thought hold that women are systematically disempowered by the terms on which classical, republican, and liberal theory organizes the social order. While these critiques have ranged widely in their assessments of the strengths and weaknesses of political theory vis-à-vis the treatment of the feminine and presumptions about women's place, they agree that the "tradition" has contributed in a fundamental way to legitimating profound gender injustices.

The contributors to *Finding a New Feminism* set out to show these critiques to be misguided. The authors attempt to demonstrate not only that we can derive new insights for feminism from the equality/difference debate and the relationship between the public and private sphere in the texts of the canon as written (without fundamentally challenging their constructions of gendered roles) but also that these texts actually offer women satisfactory and, indeed, celebrated roles in the social and political life of humanity. Thus, for feminist critics of the canon, these essays will appear to be performing a kind of alchemy, showing a tradition that has been argued to be masculinist at best and misogynist at worst to be a kinder, gentler force that empowers women to realize the best form of society. The roles prescribed for women in the canonical literature as interpreted here create the terms on which universal emancipation becomes more likely (Diane Schaub on Montesquieu) or offer women a complementary position to men that gives them effectual rather than nominal

control (Catharine H. Zuckert on Machiavelli and Ann Charney Colmo on Rousseau). Elshtain shows how a private role, mothering, can be deployed in the public sphere to hold up a mirror of morality to a militarist regime and a cowed population. Arlene Saxonhouse, in contrast, shows the dangers of enveloping public concerns (about war) into the world of the private (sexual desire) and losing what is valuable about the distinction between the spheres.

The essays together present a sophisticated argument for an ideal complementarity of gender roles (my construction) wherein women as mothers and erotic partners challenge and enrich the public world of men. Thus, the "woman question" can be resolved by imagining a society shaped by a version of equality (as shared by rights-bearing individuals who desire the opportunity for differentiation) which will allow us to remember the good things about why the sexes are essentially different (erotic attraction) and inhabit separate spheres (mutual support, moral education). Essentially, political theory does not have to change anything it already says about what women are doing in order to establish an argument for a complementarity between the sexes which will enhance liberalism: As feminists we must reevaluate women's roles as empowered positions from which to influence politics and allow and encourage them to do it better. This approach ultimately endorses traditionalist arguments about the necessity of gendered spheres, albeit in revised (and perhaps even more romanticized) form.

For example, Zuckert argues that Machiavelli's comedies show us how the prudent management of the household allows for a successful outcome for all involved, men and women. The management of the private sphere must parallel and cohere with the management of the public sphere. Women are in charge of and wield significant influence on the public world of appearances through the real world of household relations; therefore, for Machiavelli, women potentially embody virtue. In fact, since women are better at managing the private emotions, they may be superior to men, who only experience their desire but cannot channel it to achieve the best outcome. This essay is a more likely effort to recuperate Machiavelli for liberal feminist purposes than is Colmo's effort to recuperate Rousseau through a reading of his essay, "Emile and Sophie." Colmo attempts to recast Rousseau's idealized constructions of the "separate but equal" sphere of the feminine as empowering for women. She ignores the notoriously misogynist context of Rousseau's larger body of work and never questions whether someone who so clearly fears and despises "woman" as perpetrator of the fall of man from the grace of nature can be relied on to establish her freedom. Colmo reads Rousseau figuratively, claiming his construction of Sophie and Emile together represents "the tension of what it is to be human." It is an unpersuasive effort to challenge feminist interpretations that criticize Rousseau because he creates the ideal woman for man, while he creates the ideal man for himself and for the masculine community.

In an essay that represents the "real life" issues at stake in reassessing woman's role as given under the terms of the Western tradition, Elshtain's scattered, personalistic reflections on the mothers of the Plaza de Mayo celebrate these women as they reconfigure the Argentine iconography of motherhood from "weeping woman" into "defiant witness." The Mothers' Movement was a significant force in exposing the cruelty of the militarist state that ravaged civil society in Argentina from 1976 through 1983. What kind of role it played in the democratization of Argentina in the wake of the Dirty War is a different and extremely complex matter. After the demise of the military regime in 1983, the movement split

due to the "politicization" of the group. The split and subsequent marginalization of the movement were also about who would "own" the memory of the Dirty War. Elshtain only interviews her contacts on the side that insists on remaining "apolitical," in the sense of avoiding class politics or involvement with other popular movements. Elshtain's celebration of the mothers who would define their participation exclusively as safe harbors for the memory of suffering reflects the undemocratic imperative in Elshtain's critiques of feminism. That imperative is that woman remain in place as mother even as she shows herself in the public sphere in the name of democratization. Elshtain shows how the mothers, as they render public a previously private suffering, can use that identity in the name of democratic freedoms, but she suggests they should avoid becoming participants beyond that role. This aspect of Elshtain's argument reflects that of the volume as a whole, as it issues the call for woman to become a new and improved version of the identities Western political thought has always allotted her.

A word on the final essay brings me to another general criticism of this collection. Mary Nichols offers textual support to show that, rather than arguing for a natural and therefore just hierarchy between the sexes, Aristotle in fact thought that nature imbues both male and female with masculine and feminine traits. We can each embody the best characteristics of both genders. He does not say this directly, according to Nichols, because he was writing to a particular audience. She moves on to show how Aristotle's enlightened naturalism is reflected in the movie *Fried Green Tomatoes*. Nichols argues that the character Idgy represents Aristotle's ideal person, while in an aside she praises the film for excising the "lesbian component" of Idgy's relationship with Ruth (which is made clear in the novel). Nichols thus implies that this component of their identity and relationship has nothing to do with the "community" they are able to create in the context of an illiberal society. But could it not be the very illiberality of the moviemakers and of the movie-going public that led to this excision? It is particularly odd that the author would praise the movie for not "focusing" on the lesbian (read: sexual—and therefore irrelevant to the moral of the story) aspect of their relationship, and therefore getting the message about individuality and community across more powerfully, when that occlusion is precisely what inhibits the community of recognition and individuality the author is praising. There is clearly no room for the expression of lesbian desire or identity in the ideal complementarity Nichols finds that either sex may potentially embody.

In the introduction, Jensen dismisses contemporary feminist arguments that suggest differences among women may be as significant for a vibrant and liberatory feminism as what women have in common as well as efforts to deconstruct dualistic gendered roles altogether in the name of experimentation with freedom from the heterosexual matrix (obviously and unquestioningly celebrated in this volume). Her critiques construct these arguments narrowly in order to dismiss them more easily. Given the silence of the collection on race, class, and sexual identity, enforced by infrequent but significant swipes at identity politics (apparently "woman" as a group is a difference that can uphold liberal values, but race, class, and sexual group differences are anathema to the humanism espoused in this volume), I think this volume "finds" not a new but a very old, middle-class, Eurocentric feminism. As the authors fail to take issues of concrete and historical differences among women into account, preferring to treat "difference" as an abstract quality that comes naturally to all humans in their efforts to "differentiate," the new feminism of ideal complementarity will resonate for those women who

already associate "womanness" with ideal versions of the female role in the nuclear, heterosexual, bourgeois household. The abstract ideal of community and individuality all wrapped into one package and then labeled "liberalism" is eloquently described. For all its eloquence, however, I am not persuaded that the conditions prescribed for women in achieving it are or should be the aspiration of all women. They are certainly not conditions readily available to all women.

The essays in *Reconstructing Political Theory* are more diverse in their topics and purposes. The authors critically engage feminist (and nonfeminist) arguments and clarify some of the complex, interdisciplinary terrain of feminist political theory. The essays are held together by the fairly general goal of challenging typical constructions of political concepts and can be divided into two categories: those that advance (to varying degrees) discussions of concepts to which feminists historically have had ambivalent relationships and those that redescribe concepts traditionally thought of as apolitical or prepolitical.

Two essays on power, Anna Yeatman's "Feminism and Power" and Martha Ackelsberg's "Rethinking Anarchism/Rethinking Power," incorporate poststructuralist critiques of power as only repressive and of identity as unitary. Ackelsberg discusses the diffusion of power as theorized by anarchists and poststructuralists. She argues for social action that works at the very local level, "not on the basis of some universalized narrative about revolution but on the basis of challenging [a] particular oppressive relationship(s)—[which] partial and limited though it might seem, is the only politics consistent with a commitment not to deny the differences among us" (p. 171). Yeatman articulates the ambiguities of state power vis-à-vis emancipatory movements. State power as seen by emancipatory movements has usually been conceived as either coercive (which leads to a politics of rancor) or protective (as the giver of rights and entitlements). She points out, for example: "In general, women's accession to the rights of the modern individual is understood to have followed from the state's conferral of these rights. This is in direct contrast to the origins myth of men's rights as modern individuals" (p. 149). She goes on to argue for a concept of power as "capacity," which would allow feminism to take into account that women are capable of "violence, strategic cunning, and all kinds of wickedness; those which are playful and satirical as well as those which are harmful to others" (p. 154). These essays help show how rethinking power as a concept can also help us rethink the politics of social action—of what we *do* in the world as self-constituted groups and as individuals.

The final two essays in the volume also encourage us to think about how concepts are constructed and affect social action. Essays by Kimberle Crenshaw and Nancy Hirschman on violence address how policymakers and activists respond to battering. They suggest that policies ignore the lived context of women's lives and are based instead on the imagined figure of a white woman, or on abstract concepts of freedom realized by either a removal of barriers or an offering of protection, neither of which fully empower women's choices.

Taking Yeatman's essay as a point of departure, one can identify a weakness in some of the other essays, that is, they gesture toward the state as offering the means to realize their vision without acknowledging that the state is already part of the problem. The protective state (using Yeatman's construction), it seems to me, shadows their theory.

Anita Allen's essay on rights in the context of privacy as a constitutional and tort issue offers a brief historical survey of

privacy doctrine (as founded in sexist ideologies about women's modesty) and an abbreviated argument of the virtues of privacy over equality as a value shaping jurisprudence about women's lives. I say "abbreviated" because, while Allen rightly points out that equality can be interpreted in a conservative fashion (as equality of opportunity rather than of result), she does not show why privacy is any more likely to be interpreted in a progressive fashion (as freedom to carry out decisions rather than as freedom from undue influence from the public or state). Her essay offers some useful reminders of the immediate strategic use of privacy for those populations most vulnerable to state and social scrutiny, but Allen fails to persuade that it is necessarily more progressive than equality in the long run. Privacy in itself does not empower, and Allen's suggestion that it can include an imperative on the part of the state to subsidize through education and/or funding the private choices made is simply an "add-on" strategy that does not acknowledge the ultimate weakness of privacy doctrine: It artificially removes individual decision making from the sphere of the social. Relying on the state or society to empower choices of individuals "as if" they are purely private may obscure the constitutive effects of state power and end up buttressing the very real scrutiny and pressure Allen is trying to avoid in advocating privacy in the first place.

Uma Narayan also relies on state largess to realize her reconstructed vision of citizenship. She argues that, rather than being defined by individual contributions (usually thought of as wage work) or nationality, citizenship should be defined by ongoing participation in a given political space. Preserving the rights of citizenship should include preserving basic social dignity for all individuals rather than preserving the negative right to self-government or the positive right of needs fulfillment. This subtle but important distinction is drawn out effectively. Yet, the state not only will be "affected" by this new version of citizenship and participation but also will make it possible through creating the conditions necessary for all to participate. Neither Allen nor Narayan acknowledges the ambivalent relationship feminism sustains with the liberal/capitalist state (for an excellent recent discussion, see Wendy Brown, *States of Injury: Power, and Freedom in Late Modernity*, 1995).

Two essays on "rights" further discussion of this especially contested concept. Elizabeth Kiss addresses feminist concerns about rights. She maps out the existing literature, showing both the conceptual and the practical politics of rights as constructed and critiqued by liberal feminists who support rights and by theorists of care who reject rights. In doing so she argues for a version of rights that will sustain private autonomy while fulfilling the obligations of public community. Yet, she does not finally tell how, in various contexts in which political decisions are made about particular individuals' lives, we might negotiate the often conflicting issues of the right to autonomy and the demands of mutual obligation, or morality. Similarly, in "Revisioning the Family," Shanley and Minow, while articulating a theory of rights as "relational" rather than as purely individuating, do not finally show how a judge, in making a decision about custody in the context of a surrogate pregnancy contract case, for example, might take the "moral and psychological dimensions of persons into account" (p. 102). Perhaps an imagined judicial opinion that takes relational patterns of life into account would help us recognize the paradoxes and ambiguities of putting these theoretical imperatives into practice, particularly within the context of the liberal/capitalist state.

The interpretive essays in the volume are those that move to include certain concepts in the political: the role of

children in politics (Elshtain), the notions of dependency (Fraser and Gordon) and compassion (Spelman). These essays reinterpret practices that have affected women (and children) historically but are not recognized or valued as legitimately political. Considered in the context of feminist theory writ large, they contribute effective and well-grounded arguments about the politics of the personal without collapsing the one into the other. Elshtain's essay on political children complements her essay in *Finding a New Feminism*. Yet, I would pose the same question to Elshtain that I did regarding the politics of the Mothers' Movement. That is, what happens to the political subjectivity of mothers and children once in the public sphere? Must they (will they) remain the mother and the child? Will, or should, that identity not be significantly affected? Would Elshtain then be disturbed that they are forgetting their true selves?

Finding a New Feminism counters feminist skepticism of the canon with representations of an idealized complementarity between the two (and only two) genders. These essays will offer students of political theory a sophisticated version of a contemporary conservative argument that is caricatured in debates over "family values." *Reconstructing Political Theory* offers a substantive advance in feminist political theory, as the essays map out and push feminist and nonfeminist scholarship forward on a number of political concepts. I appreciate the clarity with which the essays elaborate and advance traditional and feminist debates about critical issues of politics and everyday life.

The Holy War Idea in Western and Islamic Traditions. By James Turner Johnson. University Park: Pennsylvania State University Press, 1997. 185p. \$45.00 cloth, \$16.95 paper.

David R. Mapel, *University of Colorado, Boulder*

This study compares the development of Christian and Islamic conceptions of holy war from antiquity to the present. Johnson nicely brings out several different meanings of the idea. A holy war may not mean a specific call to arms, for example, but a much more general command to strive for faithfulness (the "greater" form of *jihad* according to the prophet Muhammad). Holy war can also mean a war fought by God himself, by his duly authorized representatives, or by participants who are ritually or morally holy. While holy war is commonly thought of as an offensive war to spread religion or to punish deviance, Johnson draws our attention to the fact that "the people of the Book" have emphasized the defensive character of most wars of religion. (Unfortunately, this fact provides only limited comfort, as both traditions have often expanded their definition of "defensive" to justify essentially offensive and punitive wars.)

Both Christian and Islamic traditions begin from the idea of two worlds, one ordered toward God, the other not. As Johnson explains, for Christianity the distinction is primarily theological and motivational: the City of God cannot fully exist on earth, even in the church, but its members can be identified as those who are moved by love of God. For Islam, the distinction is primarily juridical and behavioral: Muslims are charged with replacing *dar al-harb*, the non-Islamic world of strife or "war," with *dar al-Islam*, the world of true peace, but this goal is one of achieving outer submission to law, not forcing inner conversion of belief. Johnson might have interrogated this distinction between outer submission and inner faith a bit more vigorously, as well as paid more attention to Islamic "modernists" who have challenged the medieval *dar al-harb/dar al-Islam* distinction as having little basis in an

Islamic ethics derived from the Qur'an and the practice of the Prophet. Nevertheless, Johnson is certainly right that this distinction has dominated the tradition.

According to the classical jurists, only the *imam*, who is at once the supreme religious and political leader, has the authority (and duty as representative of the community) to declare offensive *jihad*. Because the line of succession from the Prophet has broken down, both the Sunni and Shi'ite Islamic traditions agree that there is now no one with the authority to declare an offensive *jihad*. Only a defensive holy war is possible, a view that fits fairly well with current international law. As Johnson explains, two later ideas of justification and authority are not as comfortable: the idea of a "defensive" war to recover previously possessed lands, based on the duty of each individual Muslim to protect Islamic territory; and the idea of *ghaza*, an offensive war in which military success proves the presence of the blessing of God and establishes the leader as direct heir of the tradition that began with the Prophet (Saddam Hussein invoked both ideas during the Gulf War). Johnson is quite good at taking the reader through the complexities of Islamic thought about the possibility of authorizing holy war, as well as through the many historical reasons that there is no longer any recognized justification or authority for holy war in the West. He is particularly informative on some of the more recondite sources of the latter development, such as the medieval Christian redefinition of the church's authority over war as juridical rather than executive in character.

Johnson rejects as inaccurate the common idea that holy war is waged without constraints, although he notes that Christian medieval standards were not aimed at constraining war outside Christendom, while classical Islamic doctrine from the beginning was meant to limit outside wars. Johnson argues that both traditions began with the assumption that war established belligerency between entire populations. The traditions then used "functional" criteria to identify noncombatants as those who were generally unable to bear arms and thus need not be killed (but who might be enslaved). According to Johnson, what is missing until the early modern period in Europe is the notion that persons have a basic human right to be treated as noncombatants unless they pose a culpable threat to others. Johnson observes that classical juristic ideas of noncombatancy still have normative force within the Islamic community, and this "constitutes a deeply problematical difference" between the traditions (p. 127). Nevertheless, he claims that many Muslims would condemn violations of modern noncombatant rights, such as terrorism and assassination, as having nothing to do with the broader requirements of *jihad*. It would have been helpful for Johnson to explore in more detail the reasons available within the tradition for making such judgments and also to have noted that modern Western justifications of noncombatant rights are more "functional" than may first appear.

The contemporary West sees the idea of holy war as a threat to civilization, yet "traditional Islamic culture finds in the Western concept of the secular state, the very political institution which makes holy war unthinkable, an offense to God's will for the right ordering of human community" (p. 15). Johnson tries to overcome this stark opposition by developing a more informed and sympathetic picture of each side (and by showing that there are, in fact, many sides). To advance this project, it will eventually be necessary to join the substantive moral and philosophical issues more directly, as well as face more squarely the possibility that some disagreements between these traditions can only be negotiated, not fully resolved. Johnson's book is intended as the beginning of such an engagement. It is not so much a work of political

theory as an historical and analytical study of how these traditions have thought about the justification, authorization, conduct, and statecraft of holy war. A short review cannot do justice to its historical detail and nuance, but this is an interesting, informative, and imaginative book, worth reading by anyone interested in the subject.

The Reign of Law: *Marbury v. Madison* and the Construction of America. By Paul W. Kahn. New Haven, CT: Yale University Press, 1997. 324p. \$35.00.

Helena Silverstein, *Lafayette College*

One might think that a book with this subtitle would be largely devoted to an exploration of that paramount case. One might also think that by now legal scholars would have squeezed every drop of juice out of the most prominent case in American legal history. In both cases, one would be wrong. Paul W. Kahn offers a nuanced interpretation of *Marbury v. Madison*, but his attention is devoted more broadly to a theoretical exploration of the rule of law.

Kahn engages in what he terms an archaeological inquiry into the rule of law. Such an inquiry aims at the recovery of an event through examination of "the multiple layers of meaning constitutive of a single paradigmatic event" (p. 40). For Kahn, *Marbury v. Madison* is the event, and the goal of its recovery is to understand the structure of the imagination constructed within and maintained by that event. What Kahn recovers from *Marbury* is the imagination of the rule of law as a system of political order. This archaeological inquiry and recovery is founded on Kahn's view that the rule of law is a belief system structured by the imagination. As a belief system, the rule of law gives meaning to our political experiences, offers an organization of power, and provides a perspective for understanding both the community and the self.

Like all belief systems, the rule of law competes with alternative imaginations and ways of understanding our political world. Most important, law's rule, as imagined and constituted by *Marbury*, competes with a politics of revolution. The Court's ruling, Kahn argues, is an attempt to construct a political system governed by the rule of law and, as such, reveals an effort to counter and replace the politics of revolution offered by Jefferson. *Marbury* "represents the judicial contestation of the meaning of American political life in response to Jefferson's successful electoral campaign to wage a new revolution" (p. 10). But this contest over meaning is not a contest over fact. It is, rather, a battle of appearances, a struggle to capture the political imagination. Thus, for Kahn, the rule of law, like the politics of revolution and all politics, "is a matter of appearances. The truth of the rule of law is its appearance" (p. 27).

Kahn's analysis seeks to elaborate this appearance. The appearance of the rule of law should be understood in direct contrast with the appearance of action and revolution. Law's rule suppresses action, novelty, and revolution, for when action and revolution occur, law disappears. Law exists between revolutions, and the beginning of a new revolution marks the end of law. Although law and revolution are in opposition, our conception of one requires the conception of the other. Revolution needs law to negate, to define its boundaries, and to reveal to whom the revolution belongs. Law needs revolution to provide its foundational origins. Law draws legitimacy and validation from the prior revolution, yet the project of law's rule is to postpone revolution indefinitely. "To maintain the rule of law is to say 'not yet' to revolution, while saying 'yet still' to past revolution" (p. 67).

The elaboration of this conflict between law and revolution is the most compelling component of Kahn's book. Beyond *Marbury* (and it is worth emphasizing that much of Kahn's discussion of law and revolution goes well beyond this case), the illumination of this conflict has important implications for scholars interested in the relationship between law and social change. If the ambition of law is to conceal novelty and action, then those who push change through the use of law seek to engage in political action within an arena which suppresses that very action. Kahn does not resolve the tension between law and action, nor does he suggest that it is resolvable. If he is right, then those interested in law and social change will find it necessary to consider and respond to the paradox Kahn presents.

Scholars interested in the notion of representation may also be served by Kahn's work. Exploring the rule of law, Kahn finds the appearance of political representation. Distinguishing the representative character of the rule of law from the representative character of elections, Kahn expresses the contested and indeterminate nature of popular sovereignty. Within this indeterminacy, however, Kahn notes that the courts offer an appearance of representation, "because the rule of law, which informs their conduct, derives from the Constitution," a document authorized by the people (p. 203). The people become the locus for political authority, replacing the divine. This appearance of the people within the rule of law, Kahn suggests, is a claim to power that contributes to our way of knowing and experiencing the political world. Although Kahn does not use this view to answer explicitly the countermajoritarian critique of the courts, he adeptly draws on Foucault's discussion of power and knowledge to raise that perennial issue in legal scholarship.

Surprisingly, Kahn's direct treatment of *Marbury* seems almost incidental to the broader theoretical discussions of the rule of law and representation. Kahn examines *Marbury* by displaying the rhetorical techniques employed by the Court to advance the rule of law and suppress the appearance of action. Although the discussion seeks to illustrate how *Marbury* constructs law's rule, it is not difficult to get lost in the details of this rhetorical reading. Still, Kahn offers a unique interpretation of *Marbury* that will be especially appealing to those interested in rhetorical analysis.

There are moments of deep insight within this book's cultural inquiry into the law. The discussion of law and revolution as well as the analysis of law's relationship to time and subjectivity are examples. In these moments, the author's digging through the depths of law reveals significant structures of what has become known as the rule of law. But, as with all archaeological endeavors, there is much dirt and sand through which to sift, and at times the reader may feel like the archaeologist, sifting through the author's prose for the significance that lies within.

Liberalism's Crooked Circle: Letters to Adam Michnik. By Ira Katznelson. Princeton, NJ: Princeton University Press, 1996. 192p. \$19.95.

William A. Galston, *University of Maryland, College Park*

Liberalism's Crooked Circle is not (in any of the usual senses) an academic book, and it does not call for a typical academic review. It takes the form of two open letters to the Polish dissident Adam Michnik, letters from a self-proclaimed American, radical, and Jew to a Polish counterpart. In the classic manner of this genre, it seamlessly blends personal reflections, politically and historically situated analysis of

current conditions, and broader theoretically informed proposals. I admire this book, despite certain disagreements with it, as a model of informed moral and political engagement with some of the deepest social issues of our day.

The book is directed against Western triumphalism and complacency in the wake of the end of the Cold War, against what Katznelson considers a "haughty, self-enclosed liberalism" (p. 18). And not just in the victorious West; the author is gently but firmly critical of the Eastern European dissidents who, he believes, were pushed by their aversion to totalitarianism into the reactive embrace of one-sided (Hayekian or Popperian) theories of negative liberty.

Katznelson addresses two principal substantive issues: the relation between liberalism and socialism and between liberalism and cultural pluralism. Strikingly, this turns out to be an inquiry *within* liberalism: Katznelson is searching, he says, for a "liberalism of adjectives" (p. 26). The experience of the twentieth century leaves us no morally and politically responsible alternatives to liberalism. The bedrock liberal guarantees of constitutional democracy and individual liberty must be primary and nonnegotiable. So in the end we must talk about socialist liberalism, not liberal socialism; and pluralist liberalism rather than any of the currently fashionable anti-liberal theories of "difference."

With regard to the first issue, Katznelson argues that liberalism needs socialism. He cites Stephen Holmes as a reluctant witness for the proposition that while liberalism permits a redistributive egalitarian politics, it neither requires nor by itself creates that practical basis for such a politics (p. 50). (He does not seriously question the claims of thinkers such as John Rawls and Ronald Dworkin that liberalism's underlying moral principles lead to theories of economic distribution as well as political organization.) More broadly, Katznelson asserts, the characteristic "thinness" of liberal institutions creates space for illiberal social movements, against which socialism is needed as a counterweight.

But what kind of socialism? Katznelson wants to revive the project of Laski, Hobhouse, Orwell, and Dewey in terms relevant to our times. This means accepting the primacy of liberal constitutional democracy and within its institutions creating a "self-limiting socialism" (p. 24) characterized by (1) the permanent separation of property and sovereignty, (2) the abandonment of the utopian goal of a total end to exploitation and scarcity, and (3) the acceptance of the constitutive liberal distinction between the public and private spheres. Now that socialism has surrendered its claims to be an alternative form of economic organization, the focus must shift to the control of capital, organization of markets, and rectification of market inequalities. In particular, property rights must be structured to lean against the destructive consequences of unfettered capital (pp. 84–6). This is a socialism chastened by the twentieth-century catastrophe of socialist intentions, so chastened, in fact, as to be virtually indistinguishable from the welfare-state liberalism of Rawls and Dworkin.

With regard to the second major topic, the relation between liberalism and cultural pluralism, Katznelson insists that there is no alternative to an expansive liberalism as pluralism's best defense, a liberalism that avoids both the repudiation and the deification of differences. One theoretical hero of this effort is Isaiah Berlin, who has "aimed to place within liberalism a rich pluralism of values and forms of life" (p. 161). Berlin achieves a generous pluralism without sliding into self-defeating relativism. The second hero is John Locke, whose account of toleration, Katznelson argues in one of the more interesting sections of this book, offers a better guide to pluralist liberalism than Mill, whose "obsessive

antitraditionalism" makes him an enemy of the kinds of differences that should find a home within a generous liberalism (p. 141). Contemporary liberal theorists of cultural difference (Rawls, Kymlicka, Tamir) are asking the right questions but oversimplifying the dilemmas of difference (especially communal religious practices) in ways that reduce the relevance of their answers (p. 155).

There is a leitmotif in the discussion of cultural difference to which I cannot do justice in this brief review, namely, the historic role of Jews as both central and marginal. Katznelson's heartfelt personal understanding of these issues produces one of the most extraordinary passages in *Liberalism's Crooked Circle*, his criticism of Adam Michnik for being insufficiently Jewish. In Katznelson's view, Michnik has not solved the problem of affirming Jewish difference within a Polish national identity so deeply constituted by Catholicism. Michnik's desire to speak and act as a Pole means soft-pedaling the Church's historic complicity in anti-Semitism (pp. 116–23).

In practice, Katznelson's pluralist liberalism amounts to a regime of tolerance; defined as the right not to offer reasons for being different and backed by institutional and legal protections, especially in circumstances of inequality between majority and minority cultural power (pp. 171–3). In this connection, Katznelson invokes Susan Mendus's provocative metaphor of "neighborliness" as an alternative to a community.

While Katznelson's account of pluralist liberalism points us in the right direction, it leaves unanswered the "daunting question" of how the general precepts of political liberalism are to be squared with, or balanced against, the diverse perspectives and practices of subcommunities within a liberal polity. I regret that Katznelson did not conclude this book with a consideration of specific cases and controversies. Does he believe that religious communities should be exempt (on faith-based grounds) from some otherwise valid laws barring unequal employment practices for women? What liberty (if any) do Christian Scientist parents have to withhold their children from standard medical treatment? Was the touchstone case of *Wisconsin v. Yoder* rightly decided?

Despite these omissions, I am grateful for the specificity and candor (and warmth and vigor) of this book. I do not think I will be alone in reading it as a sign of the exhaustion, implausibility, and inhumanity of all alternatives to liberal constitutional democracy in the late twentieth century. The task before us is not to transcend liberalism but to enrich it in ways hospitable to the needs of a fuller human liberty.

Against Liberalism. By John Kekes. Ithaca, NY: Cornell University Press, 1997. 244p. \$29.95.

The Growth of the Liberal Soul. By David Walsh. Columbia: University of Missouri Press, 1997. 386p. \$39.95.

Aryeh Botwinick, *Temple University*

These two books in different ways seek to chart the shortcomings and limitations of liberalism, and their critiques are worthwhile and interesting. Yet, they share a common blind spot in that, under some possible redescrptions, liberalism can be shown to rebound from their criticisms and to situate itself at some point beyond them.

Writing in the tradition of Eric Voegelin, David Walsh conceives of liberalism as a system of ordering. Because it can neither fully articulate its theological and philosophical roots nor shake loose from them, it has given rise to a certain amount of confusion with regard to its fundamental commitments and values. For example, the liberal stress on human

dignity, equality, and freedom needs to be seen as both deriving from and being appropriately completed by the insights of Christianity. Walsh says that "liberal order is the trace of Christianity in a world from which it has withdrawn" (p. 201).

Walsh divides his argumentative and expository focus among historical reconstructions of key thinkers in the Western political tradition, from Hobbes to Hegel and Tocqueville, highlighting the religious dimension in their thought and making connections between his Christological framing of liberalism and central issues on the contemporary liberal political agenda. For example, with regard to abortion, Walsh wants to draw a straightforward linkage between the affirmation of the human person within Christian theology and a resistance to abortion. He says that "liberty means very little if there is no recognition of an unconditional right to life. How can the exercise of liberty be protected if we have not agreed that the being who possesses it must first be preserved" (p. 72)?

The most valuable part of Walsh's analysis consists in his explication of the metatheoretical problematic of liberalism. Walsh shares in common with Thomas Nagel and others the view that neutrality cannot be regarded as the ultimate value of liberalism, because neutrality tacitly presupposes a particular conception of the good that identifies the good with neutrality. Designating neutrality as its ultimate value has ensured "from the beginning" that liberalism would be "the tradition of the quest of the source from which it is derived" (p. 246).

It is at this juncture in his argument that Walsh proposes Christianity as the not-fully-articulated source of the conception of the good animating liberalism. Christianity for him becomes the premise that is best capable of explaining "why men and women are all equal and utterly inviolable sources of rights, deserving of the dignity that goes beyond any and all achievements within this world" (p. 247). It is not just Christianity that is conducive to this result, however, but the skeptical approaches that call Christianity into question as well. If we follow the route of the skeptic by acknowledging that we can call our knowledge statements and beliefs into question, then none of us is entitled to accord a higher status to our own statements about the world in contrast to those put forward by our competitors, and in a negative sense (since none of us can outdo our fellow human beings in the project of justification) our equality vis-à-vis one another and the need to respect one another's positions is established.

Of course, the connection between epistemological and metaphysical skepticism and political liberalism is merely rhetorical and informal in character. The skeptics in conformity with their own skepticism cannot tease out of their premises a particular blueprint concerning how to organize political life. By the same token, however, the connections between Christianity and liberalism also need to be regarded as informal and rhetorical in character. Out of the complex weave of theological and historical motifs that goes to constitute Christianity—which for long stretches has included a salience being assigned to authoritarian governing structures, to match the supremacy of divine rule—the notions of freedom and equality can be extrapolated from it and invoked to serve as the backdrop to liberalism only by way of highlighting an affinity, not by way of underscoring a tight logical, theoretical, or historical connection.

The juxtaposition of the tenets of skepticism to liberalism rather than the theological postulates of Christianity becomes even more compelling in view of Walsh's skeptical Voegelinian hedgings concerning the notion of order itself. Walsh says that "symbolisms of order are what structure our

experience of reality. They provide the context in which analysis and critique of specific issues can be carried on, but they are not themselves amenable to the same kind of objective assessment. Only from within the perspective of participating in them and only in relation to the landmarks disclosed within them can they be evaluated" (p. 261). Only ways of life are internal to specific symbolic ordering systems; there is no transcendent external perspective—no set of master symbols to order all the other symbolic systems that we use—in terms of which the external validity in contrast to the internal coherence of a set of symbols may be assessed. The dilemma to which Walsh points is already implicit in Eric Voegelin's formulation: "All the gods have to live under pressure of a divine Beyond that endows them with their divine life while threatening to let them die from their compactness" (cited in Fred Dallmayr, *Margins of Political Discourse*, 1989). Walsh in his own way thus interprets Christianity both skeptically and relativistically as meeting a test of internal coherence while remaining arbitrary from a more externally grounded perspective. Liberalism shares the same fate as Christianity. It, too, is internally coherent or can be rendered such by adjusting political practice to reflect and conform to whatever set of components in its core principles one takes to be primary, while not being able to vindicate itself outside the charmed circle created by its own set of preferred postulates. In this regard, Christianity is not ontologically superior to liberalism. Why use one to "complete" the other?

John Kekes believes that pluralism, freedom, rights, equality, and distributive justice within liberalism achieve their maximum point and force when grouped around the central value of autonomy. These other components of liberal thought stand or fall with the defensibility of autonomy. Kekes argues that the stress on autonomy within liberalism is vitiated by the prevalence of evil in the world. This, in turn, leads him to propound the thesis that "the evil that people habitually cause reflects on them adversely, even if they cause it nonautonomously" (p. 212). Liberals overoptimistically assume that "virtues are autonomous, and vices are not" (p. 202). A more realistic assessment would get them to see that increasing autonomy harbors as much prospect for increasing vice as it does for promoting virtue.

With regard to liberalism's commitment to pluralism, Kekes points to a fundamental issue of consistency. Since liberalism is liberal about everything except about the necessity of maintaining a liberal society, its value allegiances resist consistent formulation. "Pluralism" conjures up the prospect of an antiliberal society as well as of a liberal one, but the point of including "pluralism" among the litany of liberal values is to prevent such an actualization. The upshot of this analysis is that liberalism must renounce its adherence to either liberalism or pluralism, since it cannot consistently sustain both.

This last criticism brings us to the heart of Kekes's argument and helps isolate the precise juncture at which it goes astray. Kekes is driven to locate autonomy as the central value of liberalism because he is primarily interested in liberalism as ideology, not as theory. He is preoccupied with liberalism as a set of organizational principles integral to a particular mode of collective being in the world, rather than as a series of reflections responsive to some of the deepest questions human beings have raised about themselves and the world. He arrests his inquiry at the level of ideology, without proceeding to the more broadly theoretical domain.

From an enlarged theoretical perspective, we could say that the major value informing liberalism is skepticism rather than autonomy. Autonomy itself can be viewed as derivative

from skepticism. Liberalism stresses the role of the self-directing, free individual as the authentic subject of political deliberation and action because, given the limitations to human knowledge advocated by skepticism, it is only a free, self-directing human being who can generate enough data concerning human needs, ends, and wants to satisfy the requirements of political deliberation and action. Skepticism faces a serious challenge of consistency, however. It cannot be formulated without engulfing, and therefore also undermining, itself. The version of skepticism that manages to escape these strictures is a generalized agnosticism, an agnostic approach extended across the whole map of knowledge, beyond the philosophy of religion; it facilitates the cultivation of an indefinite openness toward the future, an endless deferral of final crystallization of responses to the supreme questions of life and to the balances that should subsist among them.

A generalized agnosticism enables us to resolve the tension between liberalism and pluralism. Precisely because it seeks to nurture continuing explorations by multiple communities of investigators into different sectors of experience, a generalized agnosticism remains open to the prospect that multivalued logics which create space for more possibilities than just A and not-A may eventually overshadow the two-place Aristotelian logic as a more accurate encoding of the structure of reality. Such logics chart the suspension of the law of the excluded middle and thereby enable us to circumvent the contradictions present in the formulation of liberalism. Under the aegis of multivalued logics, we can map liberal pluralism without either confirming or denying its predication upon not-liberalism.

From a generalized agnostic perspective, redrawing the balance of liberal moral and political values so as to include greater attentiveness to the need for "prosperity, order, civility, peace, a healthy environment, security, happiness, and law-abidingness" (p. 210) does not represent a departure from liberalism but an elaboration of its commitment to pluralism. Kekes says at one point that "realistic principles must be derived from, formulated in response to, and continually revised to fit the changing, shifting, unpredictable contingencies of actual human circumstances" (p. 155). The liberalism whose primary theoretical notion is skepticism remains open on an intermediate level of deliberation and decision making to the pragmatic renegotiation of its distribution of value that Kekes envisions.

A Solution to the Ecological Inference Problem: Reconstructing Individual Behavior from Aggregate Data. By Gary King. Princeton, NJ: Princeton University Press, 1997. 342p. \$55.00 cloth, \$16.95 paper.

Douglas Rivers, *Stanford University*

A Solution to the Ecological Inference Problem was published with much fanfare. The NSF, which funded the research, issued a press release, and the *New York Times* and *Boston Globe* printed stories. Few works by political scientists, much less equation-filled tomes like this one, attract that kind of attention. The reason for the notoriety is Gary King's bold claim to be able to perform a seemingly impossible feat. Since the publication of Robinson's seminal paper in 1950, generations of social scientists have been warned about the "ecological fallacy." Has King really found "a method of inferring individual behavior from aggregate data that works in practice" (p. 1)?

The most popular method for ecological inference has been ecological regression, which was described by Leo

Goodman in the *American Journal of Sociology* in 1959. King's proposed method is a random coefficients ecological regression model. The running example in his book involves data on precinct-level turnout rates (T_i) and the proportion of voting-age people in the precinct who are black (X_i). In King's notation, β_i^b and β_i^w are the proportions of blacks and whites, respectively, who turn out in precinct i , so

$$T_i = \beta_i^b X_i + \beta_i^w (1 - X_i). \quad (1)$$

Usually, the goal is to estimate the district-wide fractions of blacks and whites who turn out, denoted B^b and B^w , which are weighted averages of β_i^b and β_i^w . In ecological regression, B^b and B^w are estimated by a regression of T_i on X_i and $1 - X_i$. Goodman noted that if X_i is independent of β_i^b and β_i^w , then ecological regression provides unbiased estimates of $B^b = E(\beta_i^b)$ and $B^w = E(\beta_i^w)$. This is a well-known result in random coefficients regression models.

To this standard setup, King makes two original and useful suggestions. First, equation 1 differs from the usual random coefficients regression model because the coefficients must satisfy the inequality restrictions $0 \leq \beta_i^b, \beta_i^w \leq 1$ and because there is no disturbance. King suggests assuming a convenient distribution for β_i^b and β_i^w (truncated bivariate normal) and estimating the parameters of this joint distribution, including B^b and B^w , by the method of maximum likelihood. Second, King suggests estimating β_i^b by $E(\beta_i^b | T_i)$ and then aggregating across precincts to estimate B^b . (King actually uses a slightly more complicated procedure involving the predictive distribution of β_i^b , but the details are unimportant.) He effectively applies the computational machinery of modern Bayesian statistics to this setup.

It is important to understand that the assumptions required for King's estimator include all those required for Goodman's estimator and then some. Or, put another way, if the assumptions of conventional ecological regression fail, then King's model is also misspecified. I do not think that the additional assumption made by King—of a truncated bivariate normal distribution for the coefficients—is an unreasonable one (though it is not entirely innocuous). But readers may be misled into believing that King has somehow relaxed the assumptions of ecological regression. That is not true.

The assumption that the coefficients are independent of the regressors is the critical problem in ecological inference. Robinson illustrated the problem with a striking example: In the 1910 Census, states with high literacy rates tended to have high proportions of foreign-born persons, though literacy rates were higher for native than foreign-born persons. I found it odd that King did not test his method on the most famous example of the ecological fallacy (though he uses another empirical example from Robinson's paper). The only explanation he gives is in a cryptic footnote: "My brief analysis of some of Robinson's smaller original data sets clearly indicates the lack of information with which to make ecological inferences" (p. 241).

King does offer two arguments about the effects of aggregation bias on his procedure, but I did not find either to be fully persuasive. On the one hand, he says that the basic model can be extended to allow the coefficients to be correlated with the regressors (pp. 174ff). On the other hand, he argues in chapter 11 that his basic estimation procedure (which assumes no correlation) is somehow "robust" to violation of the assumption. It is difficult to reconcile these two claims: If the estimates are insensitive to an assumption of no correlation, then evidently the data cannot be very informative about the degree of correlation. (It turns out that the identification of King's extended model hangs by a thread

on the particular distributional assumption that he makes. A random coefficient regression model with untruncated normal errors, for example, is not identified.)

The argument that King's method is relatively insensitive to common forms of aggregation bias is harder to assess. In Part IV, King applies his method to four datasets for which microdata are available so that the accuracy of his estimates can be judged. Ansolabehere and I used the same strategy in an earlier paper; it does not prove anything, since these are just examples, but I think it provides insight into how the method performs in practice. The results King presents are encouraging. I would, however, have preferred a more systematic reporting of the results. In chapter 10, for example, King estimates that 56% of blacks were registered in 275 southern counties, when the actual proportion is 62%. (These are unweighted averages, which are not usually the "parameters of interest." King displays the posterior distributions of B^b but does not report its posterior mean.) Is this a success or a failure? King does not provide either the Goodman estimates or the aggregate bounds, but I would guess (from inspection of figures 10.3 and 10.4) that his estimates improve slightly over the other methods. Furthermore, King's method will never go completely astray, as conventional ecological regression sometimes does (with negative probability estimates).

Although there is much to like in this book, it is not without its faults. The book is sometimes verbose and disorganized. The entire proof of Appendix C, for instance, could be reduced to a single line: Equation C.1 can be obtained by dividing the last expression on p. 307 by the top expression on p. 308. The derivation of the likelihood function, which could be done in a page or two, is spread out over pages 102–11, 132–8, and 307–8. The notation is a weird mixture of Fraktur, circumflexes, and just about anything else available in the LaTeX fonts. In other places, the technical level is not what it should be. For instance, in section 9.3.2 and Appendix E, King provides a sketchy account of a nonparametric estimation technique. This is a difficult problem, and King does not attempt to justify what he proposes. In any event, what King describes will not work, since equation E.1 does not integrate to one.

None of these criticisms should detract from King's very real contribution. In most circumstances in which conventional ecological regression is appropriate, King's alternative should provide more precise estimates. Is this book an important contribution to the literature on ecological inference? Certainly. Does it solve the problem? Alas, no.

Overcoming Tradition and Modernity: The Search for Islamic Authenticity. By Robert D. Lee. Boulder, CO: Westview Press, 1997. 216p. \$62.00 cloth, \$18.00 paper.

Roxanne L. Euben, *Wellesley College*

Against the assumption that "only the West has produced political theory," (M. Henningsen, "The New Politics of History," in *The Philosophy of Order*, ed. Peter J. Opitz and Gregor Sebba, 1981; Henningsen invokes this position to criticize it.), Robert Lee raises crucial questions about the nature and extent of common political and philosophical dilemmas across cultures. He does so by tracing the contours of the modern Islamic search for authenticity against the backdrop of analogous pursuits by Western political theorists from Rousseau to Charles Taylor. The book serves as a timely reminder that those who dismiss the pursuit of authenticity as the machinations of wild-eyed Islamists fail to recognize the ways in which "authenticity" is a familiar trope

in modern and contemporary Western political thought, and that we need to attend to the nuances and complexity of Islamic attempts to theorize about authenticity. At times the analysis founders in its attempt to push loose parallels among radically different critics of modernity into a transcultural search for authenticity defined not just by common dilemmas but also by consistent themes and "analogous solutions" (p. 192). Yet, overall, this is a worthy and important foray into an underdeveloped field of cross-cultural political thought.

The author begins by identifying four crucial themes in the pursuit of authenticity as articulated by modern Western theorists: a concern for individual and cultural particularity, a radicalism defined by a struggle against both tradition and modernity, an emphasis on human autonomy in the creation of identity and history, and the "unicity" of human experience. The bulk of the book, however, is devoted to an analysis of these themes in terms of four radically different Islamic thinkers of the late 19th and 20th century: Indian "poet-philosopher" Muhammad Iqbal, who sought both to draw upon and transcend Islamic and European ideas in the name of "the true Islam"; Egyptian Islamic "fundamentalist" thinker Sayyid Qutb; Iranian 'Ali Shariati's Marxist-inspired Islamic thought; and Algerian Berber Muhammad Arkoun, professor emeritus of Islamic thought at the Sorbonne, who views the search for authenticity as the attempt to be "at home in the world" along the lines of 19th-century German historicism.

While some may regard the choice to analyze Islamic thinkers in terms of themes derived from Western debates as problematic, the author is right to insist that advocates of Islamic authenticity must be understood, at least in part, in terms of their profound engagement with Western debates. Indeed, the book generally avoids many pitfalls common to the difficult task of cross-cultural analysis. For example, Lee sidesteps the all too common temptation to essentialize what is often called "the Islamic impulse," on the one hand, or assume an undifferentiated, homogeneous "West," on the other. By contrast, he provides admirably clear and nuanced exegeses of significant Islamic thinkers, while allowing "the West" to dissolve properly into a low cacophony of arguments and anxieties that nevertheless reveal common preoccupations with the darker side of modernity. Lee strikes just the right balance between striving to understand what he calls "authentic thought" on its own terms and practicing immanent critique. His sympathies clearly lie with the sophisticated work of Arkoun, but he persuasively argues that the logic of authenticity is unconvincing even if judged in terms of its own objectives.

Framed by these arguments, the book's central ambition is to both explain and widen our understanding of the pursuit of authenticity in modern and contemporary life. While an admirable endeavor, in the course of this analysis, the search for authenticity is made to signify too much and thus, in the end, too little: It is alternately a symptom, a solution, a trope, a method, an epistemology, a strategy, and a common perspective on modernity. That is, it is a symptom of the confusion about values and identities in the modern world; it reflects the failures of liberalism, developmentalism, modernism, modernization, and the neglect of culture; it signifies a struggle against the West, universalistic reason, relativism, subjectivism, tradition/convention, essentialism, and the existing social order; it provides a method for reconstituting personal and cultural identity, epistemological and political foundations; it provides a solution to modern meaninglessness; and it represents a standard whose viability is measured by the extent to which it offers Muslims persuasive ways to cope with modernity (Qutb gets the most votes here).

While explicitly dedicated to illuminating the search for authenticity, the book thus raises another, unintended question: Given this extraordinarily broad definition, what in contemporary political thought does *not* qualify in one way or another as part of the quest for authenticity? The author carefully acknowledges differences among versions of "authentic thought," yet it is difficult to determine what the content of such thought could really be when Qutb and Arkoun, Nietzsche and Taylor are all identified as key expositors. The book is on solid ground when portraying these various theorists as critics united in the extent to which they are responding to and engaged with common dilemmas posed by modernity. But it strains to recast these widely divergent solutions, aims, and commitments as part of a transcultural search for authenticity characterized by similar themes and parallel prescriptions.

Despite the argument that autonomy is a dominant theme common to all these instances of "authentic thought," Islamists such as Qutb, for example, reject the logic of individualism, repudiate the belief in humans as self-creating, and condemn those who arrogantly view the world and history as a product of human will. While Lee is right to emphasize the importance of praxis to Qutb's thought, it is also the case that in this way, much of Islamic thought entails a critique of certain components of the Western idea of authenticity itself. Another case in point: Qutb argues that the antidote to hubristic insistence on human mastery of nature and human nature is an insistence that only God knows the truths necessary for living and living well. By contrast, Taylor is concerned with recapturing the ethic of authenticity prior to what he calls the massive subjectivist turn in recent history; he argues that this ethic was originally actuated by a laudable concern for increased individual responsibility and the insistence, against utilitarian theory, that morality had a voice within. Taylor explicitly sets his project in opposition to those in the Nietzschean tradition who posit a linkage of self-discovery and artistic creation against the constraints of morality, thereby exalting the notion of an agent with radical freedom and untrammelled power to create value.

The insistence that these thinkers are united not only in a critical engagement with modernity but also in a common attempt to reconstruct eroded foundations suggests that this search for authenticity may be but the latest expression of that paradoxical attempt to at once revive and reinvent "the real and true foundations," an attempt common to narratives of historical and political decline throughout the ages. This is in tension with the central premise of the book, that this search for authenticity is constitutively modern or, as the author puts it, "carries no meaning except in a context in which modernity has eroded cultures, values and identities" (p. 191). Moreover, in his attempt to unite them, Lee goes a step farther; he concludes that as the Islamic search for authenticity is less about Islam per se than a reflection of and response to the general "dilemmas of modernity," (p. 191) these thinkers' arguments "are not, in the end, religious arguments" (p. 193). This is a surprising conclusion for a book on Islamic authenticity. While it may be a viable reading of Arkoun, for example, it is substantially less true of the strain of Islamist thought represented by Qutb, where the rejection of Enlightenment rationalism and insistence on the complete sovereignty of God are mutually constitutive.

That said, this is an all too rare exercise in cross-cultural political thought, impressive in both its breadth of knowledge and aspirations. It may raise more questions than it answers, but the questions themselves are essential to the study of Islam and political theory alike.

The Principles of Representative Government. By Bernard Manin. Cambridge: Cambridge University Press, 1997. 243p. \$54.95 cloth, \$16.95 paper.

John Gerring, *Boston University*

This book provides a conceptual and historical overview of the development of representative democracy in the western world. There is no single argument but rather a series of observations regarding various dilemmas of this trajectory—broadly speaking, from the "direct" democracy of ancient Greece to the representative institutions of the present day.

Particular attention is given to a method of selecting political leaders that has heretofore drawn little remark from academics: selection by lot. Chapter 1 describes the use of this method in Athenian government; succeeding chapters show how it remained common among the city-states of the Italian Renaissance and how it occasionally entered into the ruminations of later English and French political theorists (e.g., Harrington, Montesquieu, and Rousseau). The plot structure of the narrative is one of decline, for by the late eighteenth century the lot seems to have been entirely abandoned as a device for leadership selection (with the notable exception of juries). "Never was it seriously considered during the American and French revolutions" (p. 79).

Manin invests the abandonment of this device with a great deal of theoretical and historical weight. The move from selection by lot to selection by election is considered to have marked the critical move from "direct" to "indirect" methods of government—the birth of representative government. Indeed, it is plausible to regard selection by lot as a way-station between rule directly by the people (collectively assembled) and rule by the people's (elected) representatives. With a system of selection by lot, the people evidently rule themselves *in turn*.

Most readers (myself included) would be tempted to conclude that the disappearance of this principle of selection can be explained by the increasing size of political units (from the city-state to the nation-state) and electorates (through the extension of suffrage). Manin, however, argues that "lot was not totally impracticable" (p. 82); thus, he takes the position that its disappearance cannot be explained with functional arguments.

There is, of course, a larger agenda on the table. Manin seems discontent with that element of representative democracy which decrees representatives be different from those they represent. The thesis—sometimes overt, sometimes covert—of this book might be found in Robert Michels's dictum that "the substance of democracy is permeated with aristocratic elements" (*Political Parties: A Sociological Study of the Oligarchical Tendencies of Modern Democracy*, 1962, p. 50). What actually distinguishes representatives from the represented? Manin concludes only that there will be *some* difference—be it greater virtue, competence, or whatever—between the person chosen to represent a constituency and the electors themselves. More than that, he will not say.

The final chapter departs somewhat from the themes of the earlier chapters. Here, Manin offers a historical typology of representative democracy, which he divides into three ideal-types: parliamentarianism, party democracy, and audience democracy. While I have some qualms about the defining attributes, I do think the typology serves admirably as a shorthand description of developments in the Anglo-European democracies over the past several hundred years. That is no mean feat. In the age of parliamentarianism, as the term implies, parliaments were the operative unit of government. This was the golden age of parliamentary oratory, "independent" MPs, and bitter factional disputes. The age, and its

style of government, is exemplified in the English case by Walpole, Pitt, Fox, Peel, and Disraeli and in the American case by such figures as Madison, Webster, Clay, and J. Q. Adams. By the end of the nineteenth century in England (and the mid-nineteenth century in America), parties had replaced parliamentarians as the principal focus of power and authority, inaugurating a new epoch in representation. The third representative form, audience democracy, can be seen in the postwar era, as parties cede power to opinion polls, political consultants, independent (nonpartisan) media outlets, and strong leaders. (Another term for this stage of democratic representation would be "plebiscitarian.") Doubtless, each country has experienced slightly different incarnations of this three-part historical schema. In the United States, for example, one might argue that the age of party democracy did not evolve to the same extent as it did in parliamentary democracies (due largely to the existence of a directly elected president). Nonetheless, this simple typology (which I have presented in somewhat different terms than Manin's account would indicate) does an admirable job of ordering the main developments of Western democracy over several centuries.

Despite a stimulating attempt to compress and periodize political theory and practice, this book suffers from several difficulties. First, the thesis could be more finely tuned, more clearly stated, and more rigorously followed. Second, there are some dubious claims. (Could selection by lot be used to fill high political and administrative positions in the modern nation-state?) Third, there are some odd normative concerns. (Why, for example, does the "aristocratic" element of representation aggravate Manin, when he understands this element as constituting *any* difference between leaders and masses?) Fourth, the book could do a better job of integrating secondary literature on the various topics addressed. (Michels, the intellectual godfather of the book, is nowhere cited; Pitkin's classic treatise on representation—*The Concept of Representation*, 1967—is relegated to a single footnote on p. 6; and virtually no empirical work on constituent-representative ties is referenced.) Finally, the key terms employed in the study—aristocracy, representation, democracy—are often used in odd and/or ambiguous ways. "Aristocratic," for example, would seem to imply more than *any* difference between representatives and the people. "Representative regimes," to take a second example, are defined as having regular election, decision-making autonomy from the electorate, freedom of expression, and open debate (p. 6). It would seem that ancient Greek city-states possessed all but the second. Does this mean that Athens was, in fact, a representative system of government? It is difficult to say.

Carl Schmitt's Critique of Liberalism: Against Politics as Technology. By John P. McCormick. Cambridge: Cambridge University Press, 1997. 352p. \$39.95.

Andrew Norris, *Duquesne University*

We have recently witnessed a striking rise of interest in the political and legal philosophy of erstwhile Nazi Carl Schmitt. Much of this has focused on Schmitt's friend/enemy criterion of the political as found in *The Concept of the Political*. It is both a strength and weakness of McCormick's fine book that it does not follow this familiar path. Its main claim is that Schmitt's resistance to a liberal politics of individual rights and constitutional guarantees of a limited government can be properly understood only in the context of a broader critique of Weberian rationalization. As McCormick demonstrates, for Schmitt, as for Heidegger, bureaucratic liberalism, legal positivism, the political primacy of the economic, and ma-

chine technology itself are all epiphenomena of instrumental reason, or modern metaphysical "technicity." Hence, such often discussed works as *The Concept of the Political* and *Political Theology* are misunderstood if they are considered in isolation from a careful reading of more obscure works, such as *Political Romanticism*, *Roman Catholicism and Political Form*, "The Age of Neutralizations and Depoliticizations," and *Theodor Daubler's "Northern Lights"*. It is in these that Schmitt most clearly delineates what technicity entails and what it opposes. And, McCormick argues, both Schmitt's theoretical and political stances are "extensions, even applications" (p. 4) of this analysis. McCormick does not limit himself to an exposition of Schmitt's thought, but neither does he want to criticize it from a perspective alien to Schmitt's own. Accordingly, his argument is not that Schmitt's political theory fails because it does not ground politics on principles of justice or individual autonomy, à la Rawls or Mill. Instead, he seeks, initially at least, to present an immanent critique of Schmitt by "reading him against himself" (p. 7; but cf. p. 300). This strategy entails demonstrating that Schmitt falls prey to the very sins he denounces in others. McCormick argues quite rightly that only this approach can hope to address adequately the temptations and dangers of totalitarianism.

Schmitt's entanglement with totalitarianism begins with his reaction to Weber. Here we find both poles of the binary which, according to McCormick, structured Weimar even as it structures our own time: the one between procedural neo-Kantianism and neo-Nietzschean Lebensphilosophie (p. 9). As becomes clear in "Politics as a Vocation," Weber stubbornly valued a model of scientific reason that was itself value neutral. This seeming paradox is hardly unique to him. Numerous theorists have pointed out that this model of reason as a means without a given end requires the supplement of the very values it denies. But since these values by definition elude rational evaluation, this requirement inevitably places reason in the service of the irrational. As McCormick deftly shows, Schmitt's initial response to this was to break with Weber's heroic or romantic nihilism and to demand a Hegelian mediation of the intellectual poles of modernity. Schmitt was not able to produce such a sublation, however. Instead, in McCormick's account, he fell back into the duality he began opposing and simply privileged a mythic form of one of its two poles, that of the irrational will.

While this reactive collapse is the guiding thread of McCormick's book as a whole (p. 298), the most focused analysis of it is found in the second chapter, "Myth as Antidote to the 'Age of Neutralizations': Nietzsche and Cultural Conflict as Response to Technology." Drawing upon Horkheimer and discussions of myth by Adorno and Cassirer, McCormick argues that Schmitt turns to myth in an attempt to master his fears by naming them. The name that Schmitt purportedly gives to technicity is "Russia." Rather than perform the hard conceptual labor of subsuming Weber's binary of reason and value, Schmitt allegedly projects one of its elements outward, onto a more manageable enemy, one that may be confronted and destroyed. This confrontation, however, will entail the reappropriation of the very technology that was projected onto the Russians, for only with its aid can they be defeated. Moreover, as the conflict is a substitute for dialectics, it reduces Schmitt's own position to an irrational one. Schmitt thus falls prey to the same dialectic of enlightenment he attacks so insightfully in *Political Romanticism*.

One weakness of McCormick's analysis here is its reliance upon comparisons with Nietzsche to demonstrate points about Schmitt. McCormick claims (pp. 84–5) a more direct

link between Nietzsche and Schmitt than most of Schmitt's readers have observed. But it remains unclear what that link may be. There is certainly no claim made of a causal influence. Instead, the reader is presented with a list of superficially similar passages from the two authors, after which McCormick concludes that their use of the language of the Antichrist encourages a latent irrationality in their thought (p. 115). Expressed this baldly, and concerning two writers who are notoriously difficult to interpret, this seems to put too much emphasis upon (the surface meaning of) their rhetoric. The comparison with Nietzsche also leads McCormick to downplay the differences between Schmitt's writings before and after his break with the Catholic Church. This is ironic, as in a later chapter on representation McCormick does a first-rate job of delineating how Schmitt understood his Catholicism in a Hegelian light, as offering a more adequate relation between form and matter, and hence between reason and will. When this is taken into account, it no longer seems that myth plays quite the role that McCormick claims, at least not in Schmitt's early work. If the Russians are Europe's proper enemy because they embody technicity (and not, as McCormick himself notes on p. 98, merely the procedural side of this binary), and if Catholicism alone adequately resists technicity, then Europe must first convert to Catholicism and then confront Russia. The threat of war with Russia may (seek to) inspire an hysterical conversion; but the conflict itself will be between two substantively different ways of life. *Pace* McCormick, it will not be "aesthetic."

But what of Schmitt's use of the myth of a demonic Russia when he is no longer in the church? McCormick declares that Schmitt's "attempt to infuse the technologically disenchanting world with meaning through 'the concept of the political' . . . is Schmitt's own succumbing to the obfuscating dichotomies of the technological modernity he criticizes" (pp. 18–19). But what is the concept of the political? More than once McCormick asserts, in a fairly off-handed way, that "the political" for Schmitt is "the transhistorically legitimated human propensity toward violent existential conflict" (pp. 17, 96, 110). This suggests that Schmitt deploys the myth of the Russians in order to foster conflict, the arrival of which—though inevitable—should be hastened, as it will somehow bring a meaning to modern European life (pp. 73, 92, 232). "The political, the postulation of an enemy . . . serves to distract from the discomfort . . . of not knowing who oneself [or] one's culture . . . is in modernity" (p. 233).

Unfortunately, this familiar and even standard understanding of Schmitt's most important category is never demonstrated through a sustained reading of *The Concept of the Political*. The closest McCormick comes to this is in his final two chapters. Here, again, he emphasizes the role played by fear in Schmitt's thought. McCormick argues that Schmitt's friend/enemy criterion is simply an appropriation of Hobbes's state of war: In other words, it is a mythic inversion of the normal and exceptional states, one intended to compel obedience through fear (pp. 14, 132, 247, 250–5). The problem with this claim is that in Schmitt's account it is unclear for what the citizens fear. In Hobbes it is for their physical life. Since this is the basis of political authority, Hobbes cannot sanction the sovereign's demand that citizens sacrifice their life. But Schmitt has no such hesitations: While he embraces the general principle of *protego ergo oblige*, he also insists that the state has the right to demand from its members the readiness to die.

McCormick acknowledges this dilemma (p. 257), only to turn immediately to a discussion of Strauss's reading of Schmitt, which he claims focuses on this problem (p. 262).

Strauss argues that, in the end, Schmitt remains within the purview of liberalism. McCormick seems to concur and argues that, because the state transcends the differences and conflicts that animate its subjects, it therefore reinstates the modern "neutrality" that Schmitt explicitly opposes as being antipolitical: Schmitt "defines his 'political' as beyond objective normative standards, by defining it as if it were neutral" (p. 263). But it is unclear why there is any necessary connection between the lack of norms and liberal neutrality. Moreover, Schmitt himself does not emphasize the neutrality of the state. Instead, as McCormick notes, he is concerned with the identification of the citizenry with the state or the constitution that gives the state life (pp. 232, 245). I can only suggest that the relationship between authority and identity lies in the fact that politics offers a form of identity which transcends the physical body and hence can sanction its sacrifice. This may strike many as repugnant, but it is not incoherent, nor does it require the prior positing of an enemy, mythical or otherwise. If this is correct, then Rousseau is a better source than Hobbes for clues to understanding Schmitt's existential politics.

This is not, however, to deny the considerable accomplishments of McCormick's book. Fear and myth may not be the keys to a complete understanding of Schmitt, but they are certainly of real significance. Similarly, whatever the status of its guiding argument, this extremely well-researched work is filled with nuanced and intelligent discussions of Schmitt's legal philosophy, his changing attitude toward commissarial and sovereign dictatorship, his relationship to Lukacs, and a host of other topics. All serious students of Schmitt, Weber, the Frankfurt School, neo-Hegelianism, political representation, and the politics of technology will want to read it.

The Morality of Nationalism. Edited by Robert McKim and Jeff McMahan. Oxford: Oxford University Press, 1997. 371p. \$45.00.

Glyn Morgan, *Harvard University*

Nationalism in one form or another constitutes the most potent and ubiquitous political force of the late twentieth century. The nation-state—the parent and child of so many nationalist movements—remains, despite the challenge of an increasingly integrated global economy, the dominant form of political membership of our age. And yet political philosophers have barely discussed either nationalism or the nation-state. To many philosophers, nationalism is nothing but an incoherent expression of group egoism, a nonrational sentiment unworthy of philosophical scrutiny. Fortunately, some political philosophers have adopted more fruitful conceptions of nationalism and political philosophy alike. Thus, in recent years Will Kymlicka, David Miller, and Yael Tamir (among others) have produced sophisticated analyses of the moral dimensions of our attachment to ethnoculturally defined groups and nations. The McMahan and McKim volume on the morality of nationalism forms a welcome and important addition to this literature.

Unlike many edited volumes arising from an earlier conference, the contributions to this book are uniformly first-rate. Rarer still, the authors speak to rather than past one another. The highlights include Jonathan Glover and Charles Taylor on the appeal of nationalism; Jeff McMahan and Thomas Hurka on the moral permissibility of favoring conationals; Michael Walzer and Robert McKim on toleration and nationalist conflicts; Samuel Scheffler and Arthur Ripstein on liberal nationalism; and David Copp and Alan Buchanan on national self-determination.

Perhaps the most valuable feature of this book is its attention to the psychological appeal of nationalism. Charles Taylor notes that this has been neglected by the modernization theories that dominate the field. Like Isaiah Berlin (whose theory of nationalism is discussed in this volume by Avishai Margalit), Taylor seeks to explain the emotive force of nationalism through a story of the injuries to dignity that cultural minorities experience in the face of superior, conquering powers. The only drawback with this argument is that the "refusal of incorporation" (p. 47) constitutes a species of nationalism rather than its genus. The members of dominant nations are often every bit as attached to their distinctive culture and traditions as are national minorities (as Walter Feinberg notes in his insightful essay). How are we to explain the attachment of the French, the Germans, and the Japanese to their respective nations?

In his response to Taylor's essay, Will Kymlicka suggests that the desire to maintain our language and culture is natural and ubiquitous. For Kymlicka, Taylor's invocation of dignity is otiose. But both can be criticized for confusing a species of nationalism with its genus. Nationalist movements sometimes develop among peoples who lack a sense of cultural distinctiveness antecedent to their struggles with their neighbors. Taylor is surely correct to think that we need an explanation of the "will to difference" that grips so many people in the modern age. The problem with his concept of "dignity" lies, I think, elsewhere. The term is morally loaded. While we may legitimately employ it to explain the nationalist struggles of an oppressed minority like the Kurds, we would be rightly reluctant to see "dignity" at stake in the struggles of Serbs and Croats for their own ethnically pure states. Here we arrive at a thorny problem that confronts everyone who sympathizes with at least some forms of nationalism: the problem of distinguishing morally permissible from morally prohibited species of the phenomenon.

This problem is pursued in a section of the book devoted to nationalism and the moral demand of impartiality. The moral injunction to treat all individuals as equals appears to stand in obvious tension with the nationalists' belief that we have some special relationship of solidarity with our conationals. To some philosophers, partiality toward them is no more justifiable than partiality to the fellow members of one's race. Thomas Hurka seeks to rebut this view by defending national solidarity in terms of the nation's history of "reciprocal benefits" and "shared suffering" (p. 151). Hurka's interesting argument permits a distinction between the moral status of "black and aboriginal movements," on the one hand, and "white supremacy movements," on the other (p. 152). Unfortunately, Hurka shirks the more difficult task of locating specific nations along the spectrum suggested by this dichotomy. Moreover, it is far from clear why our obligations to particular groups with histories of "reciprocal benefit" should be any greater than those we owe to the poor and needy with whom we lack such a history. To the poor and needy themselves, the historically based special obligations of conationals in the developed world may appear as nothing more than a self-serving attempt to justify a refusal to live up to the demands of justice.

Notwithstanding the qualified sympathy that many of the authors in this volume adopt toward nationalism, many political philosophers will still harbor a suspicion that national solidarity has produced—and continues to produce—more harm than good. These critics of nationalism will welcome Arthur Ripstein's essay, which directs some penetrating criticisms against those who have sought a rapprochement between liberalism and nationalism. To Ripstein, liberalism focuses upon fairness rather than history, or culture,

or group identity. Liberals more sympathetic to nationalism will likely respond that fairness alone rarely motivates in the absence of a sense of national solidarity founded upon a shared history and culture. This response raises some difficult sociological questions concerning issues about which, as Ripstein pointedly observes, "philosophers are notoriously lacking in expertise" (p. 224). Ripstein is perhaps too hard on his philosophical colleagues here, since contemporary social scientists do not themselves know much about the historical, cultural, and ideational prerequisites of mutual aid. Some national communities are generous to their least well-off members, while others are not. Clearly, a lot more thought needs to be devoted to this issue. The essays gathered in this excellent volume provide a useful place to start.

Republicanism: A Theory of Freedom and Government. By Philip Pettit. New York: Oxford University Press, 1997. 304p. \$29.95.

Laura J. Scalia, *University of Houston*

For generations, scholars understood classical liberalism as including nonarbitrary governments that were relatively unobtrusive and strongly committed to individual rights and liberties. Intellectual giants such as John Locke and James Madison were considered among the most important spokesmen of this tradition. Sometime in the twentieth century, (at least American) liberalism took on alternative meanings. For some, like Frederick Hayek, it tolerated only a minimalist government. For others, like Herbert Croly, it became the tradition of economic redistribution and big government. For still others, John Stuart Mill became the role model, with liberal government becoming one that accepted any and every alternative life style. In American politics, early classical liberalism became the foundation of conservatism. In scholarship there and abroad, it appears that this early tradition is now taking a different route.

As the subtitle implies, *Republicanism* offers a theory of freedom and government. The author's aim is to reintroduce important features of what Pettit terms republicanism. He does so in the hope of convincing others that this tradition values a freedom which is superior to and more practical than other contemporary notions. With this in mind, he divides the book into two main sections, the first describing the liberty ideal and the second explaining how it would be put into practice. In the first section, Pettit offers a crisp, clear definition of republican liberty: It is freedom from domination and arbitrary interference; it is the antonym of slavery. He contrasts this with Berlin's preferred notion of liberty as freedom from interference, a negative conception that Pettit finds troubling; as he sees it, it proclaims the slave free in cases in which his master likes him and chooses not to interfere with his daily life. Pettit prefers the republican conception of liberty because it supposes that someone who experiences nonarbitrary legal interference is nonetheless free. Anyone who thinks carefully about this issue will no doubt agree that Pettit is trying to recapture an important sense of liberty, different from negative liberty and certainly ignored by libertarians and various scholars of liberty. He rightfully finds his preferred conception a practical and useful way of understanding liberty, for it allows us to think beyond freedom as the absence of impediments, that is, as theoretically antithetical to law and power. If we can agree that liberty can and should include nonarbitrary, legally bounded interferences, then we can agree that there is such a thing as good government. In other words, we can agree that well-

formed states can and do support liberty, provided, of course, that they are able to avoid becoming dominating forces.

The second part of Pettit's book describes features that help government avoid its miserable tendency to dominate and become arbitrary. Here, the author discusses the kind of institutional mechanisms and citizen predispositions which would allow his beloved republican freedom to prosper. To put it briefly, Pettit believes liberty has the potential to thrive in governments that follow established laws, disperse and limit the power of the majority and their elected officials, allow for open contestation and unimpeded political debate, and are supported by a vigilant citizenry. For him, that means establishing a constitutional form of government much like the one in the United States today, albeit with some interesting new twists. For example, he argues that ongoing contestability should be more highly regarded than popular consent. He seeks to extend into the political realm the economic system of rewards and the jury system of screening. Finally, he depicts a vigilant citizenry as one in which individuals are civil to rival interest groups but nonetheless willing to manifest disapproval when necessary for liberty's sake.

Pettit claims that he has put forward a "challenging conception of the ideal" (p. 11). He has. Careful readers will find many interesting and novel ideas in the book, but many will have difficulty wading through the text and finding the great insights. This will especially be the case for readers who are sticklers for good grammar. In an attempt to avoid gender-specific pronouns, Pettit repeatedly matches singular nouns with plural pronouns. (For example, a three-page subsection of chapter 3 includes ten phrases such as: "The dominated . . . person is someone with reason to watch what they say," p. 91). What a pity that the author and Oxford University Press did not seek an alternative gender-neutral strategy, for this bizarre style certainly distracted me.

Those who have steadfast views about what ideas or persons rightfully belong within the liberal or republican tradition also will have difficulty extracting the true pearls in the argument. Pettit says that he recovered his "distinctive" republican ideal from many historical authors, over "very different periods and very different background philosophies" (pp. 11–12). Yet, he never really distinguishes his republican vision of liberty and its accompanying government mechanisms and citizen predilections from the liberal conception of liberty, government, and good citizenship. Nor does he explain why he omits features traditionally associated with the republican tradition. For example, he uses authors such as John Locke (pp. 40, 62, 100, 225, 266), James Madison (pp. 212, 221), Alexander Hamilton (pp. 100–1) and John Stuart Mill (pp. 62, 139) as authoritative spokesmen of his republican ideal. He implies that liberals accept slavery (p. 22) and that republicans do not (pp. 31–5). Historically, both kinds of regimes have tolerated slavery, but only the latter used its own language to justify it (e.g., Aristotle). Moreover, Pettit describes republican virtue as citizen vigilance (chapter 8). He associates that tradition with equality and tolerance (chapter 4). Though there may be no *a priori* reason to reject the possibility of such connections, clearly, liberalism has long been the language of equality, tolerance of ideas, and jealous virtue, whereas republicanism has endorsed hierarchy, homogeneity, and noble self-sacrifice.

Perhaps the author would not be seriously troubled by these criticisms. He finds the use of masculine pronouns sexist (p. 71). Moreover, he admits he is no "historian of ideas" (p. viii) and that "if historians of ideas find [his historiography] misleading, they should regard the more substantive historical suggestions as simplifications that are

justified only by the color they give to [his own] philosophical claims" (p. 11). Thus, for those who can easily accept these premises, the book's compelling features are easier to find. Many readers will find themselves in my position, however. They, too, will applaud Pettit's attempt to redepect liberty as freedom from domination and arbitrary government, and they will agree with him that the best means to achieve such liberty is to create a limited constitutional government and encourage civility and open debate among citizens and leaders. Yet, they will find the book unsatisfying as they wonder why he insists on calling his entire opus of ideas distinctive and republican instead of what it is: a twentieth-century take on the admirable features of classical liberalism and watered down republicanism.

In the end, however, there may be some merit in Pettit's renaming technique. Scholars now have trouble deciding who or what ideas deserve the liberal label. Perhaps the ideals we truly value would gain from a new and distinctive title. Nevertheless, such a move should be made explicit and deserves explanation. Else we will be left in even more confusion, unaware why early liberalism has become republicanism, and why republicanism has lost its earlier affinities to necessary exclusions, self-sacrificing, noble virtue, and homogeneous participatory government. Most important, we will end up masking the real issue which concerns Pettit and many scholars today: Is there a sense of liberty that is both worthy of human dignity and politically viable? On this point, Pettit has much to say and ought to be taken seriously.

Democracy, Bureaucracy, and Character: Founding Thought. By William D. Richardson. Lawrence: University Press of Kansas, 1997. 202p. \$29.95 cloth, \$16.95 paper.

Brian J. Cook, *Clark University*

In *Democracy, Bureaucracy, and Character*, William Richardson has successfully packed considerable perceptiveness and stimulating analysis within a short compass. Indeed, despite the slenderness of this volume, it is somewhat overpacked, with the same essential arguments showing up several times in slightly different form.

Like a host of other books published in the past decade on the theoretical and normative foundations of American public administration, this one begins with a litany of current attacks on the American administrative state. Beyond the superficial and immediate discontent, however, the author finds several sources of profound challenge to the administrative state. He then enumerates and briefly describes four such challenges and sources of tension: "Rational-legal bureaucracy and democracy are at once inextricably linked and antagonistic" (p. 10); "changes in the American regime and the functions assigned to the state" (p. 11); "severe limits on the degree to which American public administration is able to satisfy the demands placed upon it" (p. 13); and "the essentially elitist or hierarchical nature of the rationale constructed by administrative theorists to legitimate the power and authority of professional managers in both the public and private sectors" (p. 13).

Brevity and succinctness, which are among the book's principal strengths, are also its weakness in this early discussion. All four challenges, although handled deftly, deserve further elaboration, especially the "administrative technologies" and Tocqueville's "equality of conditions," which the author identifies as being among the forces limiting administrative performance. Nevertheless, the discussion enables Richardson to arrive at a clear statement of his aims for the book: "to bridge the admittedly contradictory elements of

American public administration and the regime it is intended to serve by examining the complex interaction of several elements" (p. 15). The "binding thread" for these elements is the author's effort to articulate "a proper understanding of and appreciation for the American character." Richardson then proceeds in the second chapter to describe and explain the regime foundations for American character traits. He follows this with five chapters that represent elaborations on his understanding, focused respectively on formal and informal correctives that complement character, the role of honor and reputation, the education of public officials, the relationship between public policy and character, and administrative ethics.

Richardson's description of the essential elements of the design of the American regime, as expressed in the Constitution and the *Federalist Papers*, is clear, concise, and consistent with other accounts I regard as authoritative. Although quite familiar with this material, particularly the commercial nature of the regime and the expectations for and dependence on individualism, acquisitiveness, and self-interest in its operation, I learned a great deal from Richardson's treatment of it. Again, the character-forming aspects of the design are the author's chief concern, and he concludes his initial presentation of founding thought with a bold statement of what is the core message of the book: Legislative, judicial, and executive officials are duty bound to pursue public policies and administrative arrangements that take account of and reinforce the character traits on which the regime is based. Thus, public administration has "a character-forming responsibility" to the regime (p. 31).

In turning his description of regime fundamentals into a tool for analyzing American administrative thought, Richardson argues that two fundamental questions arise, but they have often been ignored by administrative theorists: "What is the proper place for public administration in the governance of the regime? What outlook and attributes of character are required of these individuals?" (p. 39). Richardson is clearly a careful and astute reader of both Tocqueville and Woodrow Wilson. I found it surprising, therefore, that in this discussion, and its extension to matters of public honor and reputation, he fails to explore Tocqueville's treatment of democratic honor from *Democracy in America*. With respect to Wilson, Richardson relies much too heavily on the 1887 essay, "The Study of Administration," as the definitive expression of Wilson's views. That essay does provide strong signals about themes in Wilson's political thought that endured throughout his academic and political careers. One must look at Wilson's work in its totality, however, including published and unpublished papers, public addresses, university lectures, and political speeches. Such a look reveals that Wilson addressed directly and extensively the two questions Richardson raises, including the matter of proper administrative character and how to promote and preserve it. A more careful and thorough treatment of Wilson would have strengthened and deepened Richardson's analysis.

The highlight of the book is the linkage of founding thought and concerns about the character and role of those who would govern with public policy design. Using his examination of founding thought, Richardson scrutinizes several New Deal policies for their performance in conserving and promoting the character traits on which a regime relies. He finds them successful in expanding the scope of public administration in the regime while remaining safely within the limits set by regime fundamentals. From this analysis, Richardson derives a short list of guidelines for policy design. The guidelines are sensibly conservative, such as promoting voluntary, self-interested citizen participation

in policymaking that also encourages people to see the public interest. What makes Richardson's treatment of public policy compelling, however, is his combination of a historically oriented analysis based in regime politics with a concise and concrete expression of the essential job of the public administrator anchored in institutional design for the public interest, that is, the interest of the regime. To my mind, Richardson has succinctly defined what lies at the heart of study and practice in public policy and public administration grounded in politics rather than in economics.

The book concludes on a weak note, with the glaring mistake of identifying Abraham Lincoln's presidential successor as "Samuel" rather than Andrew Johnson! A final, brief assessment of several more recent public policies, such as the all-volunteer army, is somewhat haphazard and not very well grounded in the author's own regime analysis. Nevertheless, overall the book offers valuable argument and insight that can enrich a wide variety of courses in public administration and public policy.

Athenian Democracy: Modern Mythmakers and Ancient Theorists. By Arlene W. Saxonhouse. Notre Dame and London: Notre Dame University Press, 1996. 192p. \$26.95.

Harvey C. Mansfield, *Harvard University*

We today have embraced the view that democracy is the only legitimate form of government. Political theorists have elaborated the view in a section of their field known as democratic theory, in which every question is raised and answered according to what makes for more or less democracy. Democratic theorists are mostly on the Left, to be sure, but their premise is not challenged by thinkers or politicians on the Right. No conservative argues on campaign finance, for example, that the rich as rich deserve to have more political influence than the poor. Conservatives do resist the extension of democracy, but they generally advance an allegedly democratic reason as to why democracy should be limited or, in their view, as to why democracy requires such limitation. Rich people, it is said, must not be denied the right of free speech which their money so loudly amplifies.

On the Left there is equal embarrassment, but of a different sort. Liberals say they want to extend democracy everywhere, but in fact they do not. An up-to-date liberal today is against slavery, segregation, sexism, and homophobia; but these are historical enemies in a series of battles that were fought one by one. Liberals often did not know which battle was coming next, and so they fought slavery without opposing segregation, segregation without opposing sexism, and so forth. Liberals cannot say now what monstrous injustice of inequality we are overlooking and will soon be our duty to eradicate. They have to wait anxiously to see what will be their next cause. It seems that both Right and Left look on democracy as a tremendous force we cannot control, to which we can only react. Both have stacked everything on the legitimacy of democracy alone, and yet neither can prove it to be so. We cannot live with pure democracy, and we cannot justify any impurities.

In this situation it makes sense to go back to theorists of ancient democracy, because they did not make the assumption of our democratic theorists that democracy is the only legitimate government. That is the purpose of Arlene Saxonhouse's latest book, which began as the Frank M. Covey, Jr., Lectures in Political Analysis given at Loyola University. In her study of Athenian democracy, Saxonhouse begins with modern mythmakers, some of whom (such as Hobbes and Madison) too quickly dismiss any possibility that there may

be something to be learned from it, and others of whom (like Mill and Arendt) embrace it with irrational exuberance. These authors were all affected by the simplifying modern decision in favor of democracy, even when they did not wholly adopt it. For Saxonhouse, wisdom in political analysis shows "complexity" (p. 29)—in particular that there is something to be said for other governments, in the light of which a clearer view of the virtues and vices of democracy becomes possible.

The four ancient theorists Saxonhouse discusses—Herodotus, Thucydides, Plato, and Aristotle—all hold debates on the merits of the various regimes. Modern theorists no longer do this, not even those with sympathies for undemocratic regimes. Tocqueville, for example, contrasts aristocracy in the past with democracy in the present and future, thus making clear that the debate between them is over. What, then, do we learn from these debates that is useful today?

Saxonhouse presents each ancient theorist as having a useful theme. That of Herodotus is the equality of *isonomia*, an equality made by law, not nature. It seems that for him there is no natural right on which to ground either democracy or aristocracy. Both have to be, as we would say, socially constructed. The consequence is not necessarily favorable to democracy, because equality or *isonomia* can be had, perhaps more dependably, from monarchy. Here is a point for our social constructionists to ponder. What happens when democracy tries to subsist without natural right or natural rights?

Thucydides shows the potential for deliberation in democracy, if not at first then later, as illustrated in the Mytilenian debate when the Athenians changed their minds, rescinding a hasty decision prompted by the demagogue Cleon in favor of a wiser reversal argued by Diodotus. Saxonhouse agrees with the judgment of Leo Strauss that Diodotus, not Pericles, was the best representative of Athenian democracy. But was Diodotus an actual person or an imaginary creation of Thucydides, as Saxonhouse (still in accord with Strauss) suggests? If the latter, then Athens was not merely a democracy in speech and one-man rule in deed, as Thucydides said of Pericles' domination, but one-man rule—by Thucydides—in speech also. Democratic deliberation is assisted, completed, and even replaced by wise speech. Here is a lesson for admirers of "public reason" who think that wisdom can be made to exude from democracy.

Saxonhouse tells us that Plato, no friend of democracy, nonetheless portrays the problematic gentleness of democracy. Democracy is a particular regime; hence it has a particular character, which Plato shows in *Republic* VIII to be gentleness toward the condemned. Athens was hardly non-judgmental, as we know from the trial of Socrates, but it offered him clemency after the trial (which he refused) and toleration for seventy years before that. Democratic gentleness, we see, is apolitical; through lack of attention more than policy, it allows good men to live and bad men to rise.

"Aristotle, the exponent of a hierarchical worldview, points out the inadequacy of all attempts to put this principle of hierarchy into practice in political life" (p. 120). Let this shrewd conclusion sum up Saxonhouse's analysis of Aristotle on democracy. If a democracy is to be better than a multitude of tyrants, some hierarchical principle is necessary; but how to put it into political practice is quite unclear.

In this helpful meditation, an open-minded book, Saxonhouse wonders how the ancient theorists can be brought to the understanding and aid of modern democracy. The difficulty is that we today can only imagine a politics in which democracy is an open question; the reality for us is that, for good and for ill, democracy is a closed question. We have

more to learn when the question is open and less to fear, we believe, when it is closed.

Beyond Neutrality: Perfectionism and Politics. By George Sher. Cambridge: Cambridge University Press, 1997. 251p. \$54.95 cloth, \$18.95 paper.

Richard Dagger, *Arizona State University*

George Sher begins this important, argument-packed book with the following confession: "I am ambivalent toward contemporary liberalism" (p. ix). On the one hand, "many of today's liberal thinkers are waging a necessary and courageous battle on behalf of certain vital but embattled Enlightenment attitudes," the most important of which is "a confidence in the power of reason to resolve our disagreements. Without such confidence, we are at the mercy of the post-modernist tendency to reduce all political and intellectual disagreement to so much jockeying for power and advantage" (p. ix). On the other hand, Sher is troubled by a "deeply problematic" turn in contemporary liberal thought: "Though still confident about our ability to reach universally applicable conclusions about justice and rightness, these [liberal] thinkers are much less sanguine about the prospects for reaching reasoned conclusions about goodness or value" (p. ix).

Sher thus enters a debate in which the terms are familiar, if not always clear. On one side are those "neutralists" who argue that "the right" is prior to "the good"; on the other are various "communitarians" who insist that "the good" is prior to "the right" as well as "perfectionists" who hold that the only credible form of liberalism is one that aims not for neutrality but for promotion of distinctively liberal virtues. Sher takes his stand with the latter groups, although he also takes pain to distinguish his position from theirs. The liberal perfectionists, among whom Sher includes William Galston, Stephen Macedo, and Joseph Raz, have provided a merely internal criticism of liberal neutralism: "Instead of defending their value-claims, they are often content to remind us that theirs are the values of liberalism, and that most neutralists themselves accept those values" (p. 152). To demonstrate that liberals are committed to certain values and necessarily promote certain virtues is "no substitute for a full positive argument" (p. 152) that establishes the worth of these liberal values and virtues. For their part, the communitarians—Charles Taylor, Alisdair MacIntyre, and Michael Sandel—have tried to provide such a positive argument by tracing "the superiority of certain ways of life either directly to the relevant society's history, culture, traditions, and narratives, or else to the connection between these social factors and the identities of individuals" (p. 152). But they have failed to provide a clear and coherent account of "what our traditions, narratives, and the like require of us" (p. 152). Sher thus aims for a version of liberal perfectionism that will supply the deficiencies of these other criticisms of liberal neutralism.

Before advancing his "full positive argument," however, Sher devotes five chapters to a careful scrutiny of the neutralists' arguments. Chapter 2 is especially valuable for Sher's analysis of the phrase "conception of the good," which leads him to conclude that the idea is far from straightforward. On the contrary, there seem to be three overlapping intuitions at work, each one leading to a different justification for neutralism. The first leads to various attempts to justify liberal neutralism by arguing that only a state neutral with regard to conceptions of the good is consistent with personal autonomy. The second advances the case for "prophylactic neutrality" with the argument that "the modern state's power is so vast, and those who wield it so flawed, that no govern-

ment can be *trusted* to promote its citizens' good" (p. 106). The third takes the skeptical position that states should remain neutral with regard to conceptions of the good because there is no way to know what truly is good. Sher's arguments against the neutralists who defend these positions—principally John Rawls, Ronald Dworkin, Charles Larmore, and Bruce Ackerman—are too involved and too numerous to summarize here. But it should be noted that Sher is an admirable critic who sets out his opponents' arguments clearly and fairly before lodging powerful objections against them.

Sher's own version of liberal perfectionism, developed in the last four chapters, is both "pluralistic" and "monistic." It is "pluralistic in the sense that it attaches value to a number of irreducibly different activities, traits, and types of relationship" (p. 199). What makes these valuable—and Sher's perfectionism monistic—is that they all grow out of fundamental human capacities "whose exercise is both near-universal and near-inescapable" (p. 202). That is, every person has reason to value "knowledge, rational activity, and close personal relations" (p. 207). Further argument leads to the addition of "moral goodness, the appreciation of true beauty, and the development of one's abilities" (p. 207) and eventually "decency and good taste" (p. 212) to the list of qualities that everyone should value and the state should foster.

Two features of this list are especially noteworthy. The first is that these qualities may seem universally desirable simply because they are so vague. Everyone may agree that knowledge is good, for instance, yet disagree about what kinds of knowledge are worth having. But complaints of this sort will not trouble Sher, whose open-ended brand of perfectionism "does not seek to *ground* the state in any particular conception of the good, but nevertheless holds that a government may legitimately *promote* the good" (p. 1). The job of the state is not to identify the forms of knowledge, rational activity, or personal relations that are truly good but to enable its people to make these discoveries for themselves.

The second noteworthy feature of the list is the inclusion of "decency and good taste," which may raise suspicions about what Sher would have the state do to promote "moral goodness" and "the appreciation of true beauty." Would Sher's perfectionism license attempts by the religious Right, for example, to impose its conception of "traditional morality" and a steady diet of Norman Rockwell paintings on American society? This hardly seems to be Sher's intent. Indeed, he is more concerned "that an endless diet of punk rock or sitcoms leaves one ill-equipped to appreciate the music of a Mozart or the prose of a Jane Austen" (p. 213). What exactly he would have the state do to turn people away from sitcoms and toward *Sense and Sensibility*, and how he would prevent the state from forcing sectarian or majoritarian views on everyone, is a subject Sher does not address.

I wish that he had, just as I wish that he had addressed some of the cases raised by fundamentalists of various religions who apparently value autonomy much less than do the philosophers on both sides of the neutralist-perfectionist debate. How, for instance, would Sher's perfectionism settle the case of *Wisconsin v. Yoder*, in which the Old Order Amish maintained that the salvation of their children and their community was of greater importance than the goods of knowledge and the development of one's abilities?

Sher would respond, I suspect, that a perfectionist theory of politics need not settle every issue. For the open-ended, pluralistic version of perfectionism that he defends so ably in this book, in fact, the complete absence of public controversy

would be a sign of failure. To which I can only respond, books as good as this one always leave the reader wanting more.

And this is a very good book indeed. It brings much-needed clarity and philosophical depth to the neutralist-perfectionist debate, and it presents a challenge to the neutralists that they cannot ignore. If *Beyond Neutrality* is not the last word on the subject, the reason may be that so many other words will be written in response to it.

Vindicating the Founders: Race, Sex, Class and Justice in the Origins of America. By Thomas G. West. Lanham, MD: Rowman & Littlefield, 1997. 218p. \$24.95.

James H. Read, *College of St. Benedict*

The aim of this book is to defend the founders against the charge that they were racist, sexist, and biased toward the interests of the wealthy. But its purposes go far beyond a mere defense: West seeks to turn the tables on the critics and demonstrate that the founders' understanding of racial equality, gender relations, property rights, and wealth was superior in every respect to that of modern liberalism and feminism. He targets not only those who directly charge the founders with racism, sexism, and so on, but also scholars who claim the founders' understanding of racial and sexual equality was progressive for its day but limited by the circumstances of the age. For West, the founders' philosophy is true for all times, and our most serious contemporary problems result from forgetting or turning away from it.

West's "vindication" thus takes two somewhat different forms. The first is a defense of what the founders actually said about matters of race, sex, class, and justice. The second is a description of what he thinks they would have said about an enormous range of modern-day issues, including environmental regulations, women entering the work force, AFDC, and single-parent households. The author displays no doubts about the founders' views on current issues. All of them—Madison, Jefferson, Hamilton, Adams, Wilson, Franklin, Washington—would be political, economic, and social conservatives opposed to modern liberalism and modern feminism.

West's argument can be summarized as follows. (1) The founders held a single, coherent philosophy on matters of race, sex, property, and justice (no significant differences among the various founders are described). (2) This philosophy is true. (3) Nothing that has occurred in the last 200 years—no change in polity, economy, or society—alters in the slightest the truth and relevance of this philosophy.

The most convincing and historically focused chapter in the book deals with slavery and race. In answer to the frequently repeated charge that the founders did not consider persons of African descent to be "men" at all, West marshals an impressive body of evidence in support of the claim that they considered them to be "men" entitled to the natural rights announced in the Declaration of Independence. He argues that it was the logic of the Declaration that led to the abolition of slavery in the northern states and to a wave of manumissions in the South.

If the founders knew that blacks were equally entitled to natural rights and that slavery was wrong, why did they not—especially Jefferson—do more to abolish it? Here West runs into difficulties. He is on fairly solid ground in claiming that abolition could not have been accomplished at the Constitutional Convention. But why was the cause not taken up seriously afterward? Benjamin Franklin's last public act was to bring an antislavery petition to Congress. Why did Jefferson and others not follow Franklin's example? West

takes at face value every one of Jefferson's excuses for postponing action against slavery. Would abolition have ranked higher on Jefferson's list of priorities if those held in slavery had been white?

The chapters on women and the family are the least convincing in the book. West argues that the founders did consider women to be entitled to the same natural rights as men. But they did not believe voting rights for women were especially important, because they saw no divergence of interest between women and men: "Americans of both sexes thought women were well represented by their men whether they voted or not" (p. 78). West also points out that women wholly dependent for their support on their husbands were "suspected to have no will of their own" (p. 80) and thus, it was argued, could not cast a free vote. He sees no contradiction between this notion and the true equality and common interest he claims existed between the men and women of the age.

West's principal quarrel with modern feminism concerns its denial that the traditional sexual division of labor is founded in nature. "Nature points most women toward, and most men away from, the care of small children," he insists, and "by nature, men are more likely than women to gravitate toward technical expertise and full-time careers" (p. 89). To deny these natural differences is to reject the ideal of the Declaration of Independence, "which recognizes and protects the equal rights, and therefore the natural differences, of all" (p. 88).

On property rights and wealth West argues that the founders' intention was not to protect the wealth of an elite but to create economic opportunities for the middle class and poor. The founders favored public relief for the poor who were unable to work. But for the able-bodied they believed the best poverty-reduction measure was a dynamic economy stripped of all feudal limitations on the use of one's property, such as entail and primogeniture. This leads West into an attack on modern-day restrictions on property rights. He claims that the founders would have considered modern environmental regulations regarding wetlands and endangered species as "unjust (because uncompensated) seizure of private property" (p. 55). Environmental regulations also hurt the poor by making it difficult for them to start a business.

It is perfectly legitimate to make a contemporary political argument inspired and shaped by a reading of the political thought of the founders. It is another thing for West to claim that his own arguments are really those of the founders, even on issues and problems they could not have foreseen. This is to abuse the founders' authority. And it will "vindicate" the founders only among those who already share the author's political and social views. The book is likely to make many readers—unfairly, in my view—more suspicious of the founders than they were before.

A Trumpet of Sedition: Political Theory and the Rise of Capitalism, 1509–1688. By Ellen Meiksins Wood and Neal Wood. New York: New York University Press, 1997. 150p. \$30.00.

Edward J. Harpham, *University of Texas at Dallas*

Over the past twenty years, our understanding of sixteenth- and seventeenth-century political thought has undergone something of a revolution. Studies that traced out the rise of liberalism or the possessive individualist paradigm in light of emerging capitalism have been replaced by complex histories of civic humanism or natural jurisprudence. These newer

texts explore the evolution of various languages of discourse in different historical contexts. While insightful, these studies all too often suffer from a complexity that is difficult to read, much less understand. The themes integrating a particular episode in the history of political thought often get lost amid a wealth of details and convoluted arguments.

One pleasure of *A Trumpet of Sedition* is the way in which the story behind sixteenth- and seventeenth-century English political thought is made intelligible to the reader. Abandoning much recent scholarship that situates ideas in a largely intellectual context, the Woods unabashedly adopt a Marxist approach to the study of ideas. Ideas are not simply free-floating abstractions that evolve from thinker to thinker. They are responses to and reflections of the social, political, and economic environment of which they are a part. In the hands of some, such an approach often deteriorates into a simplistic can that traces out the rise of capitalism and the triumph of the bourgeoisie. In the hands of the Woods, however, the approach sheds new light on an old story.

According to the authors, three historical factors define the context within which political thought should be understood in the sixteenth and seventeenth century. Agrarian capitalism laid the groundwork for market-oriented economic development and the accompanying social dislocation. The centralized state built by the Tudors bequeathed to the Stuarts state institutions that were unified but vulnerable in important ways. In response to these turbulent times, there emerged a number of important radical thinkers who helped change the way in which political and economic life was understood. Even when defeated, the legacy of these radicals lived on in popular movements and in the thought of their adversaries, who were forced to confront their ideas. Taken from a passage in Hobbes's *De Cive*, the book's title captures the important role that the Woods want to grant radical theorists in the history of ideas.

The Woods are most creative in their treatment of sixteenth-century thought, which draws heavily upon the earlier work of each. Through a succinct analysis of largely unheralded theorists, they explain how the revival of classical humanism in England gave rise to a new "mode of social criticism" that moved beyond classicism. This new social criticism was followed by a number of conceptual innovations. Thomas Smith (1513–77) envisioned the state in terms of individuals, not corporate entities, and helped to lay the foundations for political economy by arguing that avarice could be a positive good conducive to civil order. John Ponet (1516–56), the first advocate of violent resistance to government by private individuals, articulated a secular notion of government as a trust. Discussions of Smith and Ponet, as well as the more well-known Sir Thomas More (1478–1535) and Richard Hooker (1554–1600), provide the backdrop for creative analyses of the Levelers, Hobbes, and Locke.

Although brevity and clarity may be virtues, particularly for writers, even virtues have their limits. *A Trumpet of Sedition* has only 137 pages of text, and it cries out for more extended discussions of certain topics. Many influential figures are left out of the story, such as the Dutchman Hugo Grotius and the Englishmen John Selden and John Milton. No real attempt is made to engage other scholars in a dialogue over how one should read sixteenth- and seventeenth-century English political thought. Although criticism is made of the work of Richard Tuck, who published a considerably longer book on the same period in 1993, the Woods make no serious effort to explain how their accounts differ from his or how they agree. With only seven extended footnotes in the whole, relatively few embedded references, and a brief annotated bibliography—

phy, this book is largely inadequate for anything beyond an introductory course for graduate students.

The lack of a more scholarly orientation is unfortunate for another reason. It begs the question of the limits to a traditional Marxist approach to the history of ideas. What is gained by adopting such an approach? What is lost? Must the insights of scholars such as Quentin Skinner or J. G. A. Pocock be ignored because they work out of different intellectual traditions? More to the point, must readers adopt the value orientation built into a Marxist framework if they are to profit from reading books such as this? In the last few pages, the Woods make clear their own political orientation. They see modern capitalism as standing in the way of an "emancipatory project" begun by early modern radicals like the Levelers and the Diggers in the seventeenth century. All readers may not agree with the authors' starting assumptions or conclusions. As the twentieth century has demonstrated time and again, being radical is not tantamount to being right. Much political tragedy has resulted from the misplaced utopian dreams and emancipatory projects of radicals. But it would be unfortunate if different value premises to the study of ideas or to politics in general kept readers away from this short book. *A Trumpet of Sedition* deserves a broad audience and a close read.

Postmodern Platos: Nietzsche, Heidegger, Gadamer, Strauss, Derrida. By Catherine H. Zuckert, Chicago: University of Chicago Press, 1996. 351p. \$56.00 cloth, \$19.95 paper.

Bernard Yack, *University of Wisconsin, Madison*

Catherine Zuckert's new book is a comparative study of the interpretations of Plato's thought and legacy offered by Nietzsche, Heidegger, Gadamer, Strauss, and Derrida. That said, one may begin to wonder whether the title of the book, *Postmodern Platos*, represents anything more than a marketing maneuver. Such suspicions, however, are unwarranted. Zuckert has good reason to describe these five encounters with Plato as "postmodern," for they are all inspired by a diagnostic interest in identifying and moving us beyond the characteristic defects of modern life and thought. All five of the philosophers studied in this book think of themselves as, to use Nietzsche's expression, "doctors of sick culture." And all five come to the conclusion that developments in Western philosophy play a crucial role in generating modernity's ills. Accordingly, they all turn to the study of Plato, the founder of the Western philosophic tradition, as a form of therapy—whether, as in the case of Nietzsche, Heidegger, and Derrida, in order to figure out exactly where we went wrong or, as in the case of Gadamer and Strauss, in order to recover the original and superior understanding of philosophizing that modern developments have obscured from view.

At first glance, Strauss may appear to be the odd man out in this philosophic gang of five. After all, while he stubbornly defends both classical rationalism and the possibility of understanding texts as their authors intended them to be understood, the others rank among the most important critics of classical rationalism and defenders of the hermeneutic or interpretive turn in continental philosophy. But Zuckert does a good job of showing how Strauss fits in with this group. In particular, she makes a strong case that his turn to Platonic rationalism is inspired by many of the same Nietzschean and Heideggerian questions that lead Gadamer toward hermeneutics and Derrida toward deconstruction.

One of the nicest things about Zuckert's book is the way in which it brings to life the dialogical character of these

thinkers' approach to philosophy. All five treat their encounters with the great minds of the past as a form of philosophizing which, when done properly, can lead to surprising insights about oneself, rather than just information about past beliefs. By bringing their interpretations of Plato together in one book, Zuckert impresses us not only with the wealth of insight and intellectual vitality that this dialogic approach can produce but also with the variety of ways in which it can be carried out. (I would add, though this is not a point Zuckert makes, that viewing these five different versions of dialogic philosophizing together also helps us better locate its inherent limitations.) Moreover, by engaging these thinkers in a continuing dialogue with one another, Zuckert gives her book some of the dialogic sensibility that they all prized.

In order to bring these thinkers together in this way, Zuckert has to exaggerate a little the importance of Plato in the work of Gadamer and Derrida. For them, I suspect, the study of Plato deepened and confirmed, rather than inspired, their most important insights. In any case, their accounts of Plato lack the sense of mystery, the sense that there is a secret waiting to be discovered, that hovers around the encounters of Nietzsche, Heidegger, and Strauss with Platonic thought. Nevertheless, this exaggeration is not very great and does not prevent us from benefiting immensely from the comparisons that it allows Zuckert to construct.

One final point. Readers will quickly notice that Strauss receives two or three times more space in this volume than any of the others. This allocation reflects both the author's sympathies and her accurate assumption that readers will be least familiar with the philosophic background of Strauss's work. While this disproportionate attention may disappoint those looking for fuller accounts of the other thinkers, I do not believe it is a serious flaw. The accounts of Nietzsche, Heidegger, Gadamer, and Derrida are all fair, accurate, and insightful, even if more might be said about their encounters with Plato. Moreover, by studying Strauss in the context of the philosophic questions that he shared with these other thinkers, Zuckert corrects the unfortunate tendency of many of his friends and enemies to treat his thought as *sui generis*, as philosophically, if not politically, rootless. As a result, Zuckert's book offers us not only a fine comparative study of different interpretations of Plato but also a very helpful introduction to Strauss's philosophical thought.

The Natural Rights Republic. By Michael Zuckert. Notre Dame, IN: University of Notre Dame Press, 1997. 304p. \$32.95.

Robert Webking, *University of Texas at El Paso*

The republic of which Zuckert writes is the United States as created in the final quarter of the eighteenth century. The title makes clear Zuckert's fundamental argument: Although the Americans did not create the philosophical theory of natural rights, they made the most explicit and thoroughgoing commitment to it that had yet been practiced anywhere. Zuckert works both to explain the use of this philosophy as the foundation of the American regime and to defend the argument, put forward by other students of the American founding, that the belief in natural rights was not the core concept of what is advantageous and just that shapes American political life. Zuckert focuses on the Declaration of Independence as the most clear and important document stating the Americans' adherence to the natural rights position as well as their "political creed" during and since the founding generation. In exploring its meaning, Zuckert relies

heavily on the political thought of its author, Thomas Jefferson.

Part I is devoted to an analysis of the Declaration and an exploration of the philosophy it expounds. The first chapter confronts the word themselves, seeking the meaning of the equality and rights mentioned in the most well-known passage. The Declaration asserts that its principles are "self-evident" truths, and Zuckert takes the assertion seriously, focusing first upon the language and structure of the document itself. The reading which results shows clearly that liberalism is at the core of the Declaration and casts doubt on the validity of the classical republican and communitarian approaches to understanding the foundations of American politics. It also points to the problems with the interpretations offered by other commentators, especially Garry Wills, Paul Eidelberg, and Morton White. The second chapter reflects on the asserted self-evidence of the truths. Zuckert notes not only the meaning of "self-evidence" but also the importance of the citizenry "holding" truths to be self-evident. He next moves to an effort to elucidate the deeper philosophical meaning of the Declaration's principled statements in a way that the short and powerful phrases of the document itself cannot. With the comment that the founders apparently believed the ground of the truths they affirmed in the Declaration, Zuckert examines that ground especially through analysis of Jefferson's political thought. He turns particularly to "Notes on the State of Virginia" to explore Jefferson's understanding of nature and human nature, and on the basis of that discussion Zuckert develops the meaning of and relationships among the natural rights. He clearly shows Jefferson's adherence to the position that there is an important natural right to property, along with rights to life, liberty, and the pursuit of happiness.

Zuckert uses Part II to consider three competing visions of the thought behind the founding. He maintains and, indeed, further clarifies the basic importance of natural rights for Americans while suggesting that three alternative explanations of America may contribute something to the way Americans see themselves and political life. Zuckert's discussion of the view that the American Revolution was not based on novel principles but on a continuation of themes from the "old Whigs" of the British Glorious Revolution takes the form of comparing the principles embraced in the Declaration with those of the English Declaration of Rights, a

document written to explain the Glorious Revolution. The comparison shows powerfully the American departure from traditional views on human beings and politics toward the new Lockean understanding.

Moving to the view that the American founding is best understood in terms of the Puritan religious principles that animated the immigrants in the seventeenth century, Zuckert compares the philosophical position of the Declaration to that taken in the Mayflower Compact and in a John Winthrop sermon. The clear and striking differences show plainly the movement away from Puritan principles to the natural rights philosophy. That movement can be seen in the views of Protestant ministers themselves, as Zuckert shows in the chapter on the "Lockeanization of Protestant Political Thought."

The final chapter discusses the view that "classical republicanism" is the perspective on human beings and politics that lies at the base of the American founding. Again, Zuckert shows the incompatibility of that view with the natural rights philosophy of the Declaration of Independence. He then continues to explore the role of a kind of republicanism in Jefferson's political thought. He discovers there, more than in others of the founding generation, a new kind of republicanism, but one still focused on the importance of individual natural rights.

It is often difficult for people to consider the meaning of words so familiar as those in the Declaration of Independence. The difficulty is further complicated when the words have led the reader to see human beings and politics in a particular, usually unexamined, way. Zuckert's book helps open up to examination the meaning of the Declaration and, through it, of the American founding. The direct analysis of the Declaration is clear and compelling. The meaning and implications of the philosophy are made still more clear by the analysis of Jefferson's thought (which, of course, cannot be taken simply as the thought of the American founding) and especially by the comparisons to the English Declaration of Rights and Protestant thought of the seventeenth and eighteenth century. In leading readers to work with and reflect upon these writings in the way he does, Zuckert helps them not only to a clear view of the natural rights republic but also to consideration of the meaning and sources of that republic, and to thought about the relationship between philosophy and political life.

American Politics

Democracy and the Policy Sciences. By Peter DeLeon. Albany: State University of New York Press, 1997. 160p. \$18.95.

Policy Design for Democracy. By Anne Larason Schneider and Helen Ingram. Lawrence: University Press of Kansas, 1997. 241p. \$35.00 cloth, \$15.95 paper.

Matthew A. Cahn, *California State University, Northridge*

Policy studies have emerged as an increasingly important subfield within the discipline over the past decade, with the policy sciences literature taking an increasingly central place in that emergence. The subfield is torn among competing paradigms and methods. Area studies, policy theory, process analyses, strategic analyses, and evaluative research each offer insight into policies and their implications. *Policy Design for Democracy* and *Democracy and the Policy Sciences* stake

out what may become the most important niche in the subfield: the linkage of policy tools (tools for making "better" policies) with the normative concern for increasing civic participation. Each book argues persuasively that policy design is a purposeful effort reflecting specific values and interests, not merely the result of systematic political processes. If this is true, then surely policy designs with democracy as a central value are an appropriate and worthy end.

Schneider and Ingram begin with a statement of their central contention: The structure and design of contemporary public policy discourages active citizen participation. "Rather than provide institutions and symbols to ensure that the self-correcting mechanisms of pluralist democracy will be operative, the policies deceive, confuse, and in other ways discourage active citizenship" (p. 5). The book begins with a review of the four dominant theories of public policy: pluralist democracy; policy sciences; public choice; and critical theory. Pluralist theory contributes insights into the impor-

tance of participation, coalition building, and procedural justice. The policy sciences contribute an applied concern for linking policy instruments to specified goals. Public choice contributes a meaningful language of the marketplace of ideas, goods, and services, and it challenges us to limit governmental interference into any of them. Critical theory contributes both a substantive normative foundation for democracy as well as a method for unmasking degenerative social constructionism. More important, the book reviews the evolution of policy design theory, allowing the authors to assess the role of social constructionism implicit in public policy, both in defining policy targets (those who will benefit or be punished) and in defining policy knowledge (interpretations of reality). The book then assesses each prominent theory for its contributions and limitations. Based on this discussion, the authors develop a series of observations that can be applied to real-world policies. They conclude by suggesting that these observations can be used as general principles in democracy-based policy design.

Are they correct? The role of social construction in policy design is of critical importance, but all too often completely ignored, as if the world were perceived in precisely the same way by every person in every circumstance. In this Schneider and Ingram make their most useful contribution. Drawing on deconstructionism to demonstrate that traditional policies have always *implicitly* constructed a policy environment, but one that actively discouraged civic participation, the authors demystify the social engineering that characterizes any public policy. If social perception varies, then policy narratives, as well as policy language, must implicitly define the context of social environs. As a consequence, the general principles that Schneider and Ingram suggest may allow policymakers to construct a social environment within which the institutions that foster civic participation are not merely encouraged but mandated.

There is one enduring problem with the logic of *Policy Design for Democracy*. Schneider and Ingram accurately point out that policy designed by scientists and professionals will consistently reflect the values and interests of the sciences and professions—elites by any meaningful definition. Is it possible for policy scholars to suggest a set of neutral principles that would democratize the policy process? Alternatively, if policy elites were able to engineer policy designs such that they would construct a more open process, would this suggest that policy professionals were in fact able to exceed their narrow values in the interest of democracy generally? This catch-22 is not merely semantic. It goes to the core of policy scholarship. If policy professionals cannot design interest-neutral policies, then Schneider's and Ingram's general principles themselves may be suspect. If, at least on occasion, policy professionals can offer design principles that reflect the broader interests of democracy, then is it not possible that the policy scientists and professionals may be able to design efficient and interest-neutral policies? Since Lindblom, policy scholars have recognized the often tense relationship between efficiency (policy success) and democracy. In many technical policy areas, more participation may inhibit rational policy design. The current environmental justice literature provides ample illustration of this: The NIMBYism surrounding many environmental questions has actually exacerbated unequal distribution of policy benefits. In this context the tension between efficiency—even equity—and democracy can be understood with greater complexity. Is it always true that more participation is better?

This tension is by no means detrimental to the quality of the argument. In fact, it enhances the intellectual utility of the book. Through engaging this tension in this argument, the

authors force readers to engage the tension in the discipline generally. Specifically, is it the function of public policy to resolve narrow public problems in a value-neutral way, as a mechanic might approach a rattle in a car, or is public policy responsible to the broader structures of maintaining democratic values and civic participation? The book is cogent and well written, offering clear discussion in a logical format with just enough restatement of the central thesis in each chapter to allow the reader to follow the discussion clearly and substantively. In reviewing the major themes of the policy subfield, and in offering an analytic framework for improving both the understanding of the policy literature and, indeed, the policy design approach, the book is useful for graduate courses, policy professionals, and the discipline generally, as well as policy scholars in search of a central paradigm.

In *Democracy and the Policy Sciences*, Peter DeLeon confronts the role of the policy sciences specifically in inhibiting democratic participation. He begins with a discussion outlining what he believes to be the problematic nature of American democracy. In so doing he presents a wide discussion on democratic theory as it is manifested in the American national psyche. He then applies the democratic discourse to the foundational literature of the policy sciences in an effort to excavate its democratic foundations. Finally, DeLeon assesses the efforts of the policy sciences to get beyond the positivist quagmire of economics-influenced analysis. In the end, he integrates these discussions in an effort to build a policy science capable of rescuing participatory democracy. In short, Americans are increasingly frustrated with political gridlock, impersonal government, and bureaucracies that appear Byzantine to anyone outside the organizational structure, all of which is reflected in low levels of traditional participation (e.g., low voter turnout) and increasingly harsh displays of political cynicism (e.g., "bureaucrat bashing"). Rather than inadvertently encourage this frustration, DeLeon asks what the policy sciences can do to convert that passion into positive participation.

The core problem, DeLeon reminds us, is that the sheer size of the citizenry makes traditional notions of civic participation impossible. Direct participation in policy decisions is impractical, and participation in policy hearings is at best inconvenient for those outside policy circles. Whether or not voluntary associations ever played the dominant role suggested by Bellah and others, they are increasingly difficult to maintain in our fractured global economy. In such an environment, the Madisonian accommodation of interest group democracy may be a viable—if not desirable—compromise. The problem with much of the traditional literature on democracy and participation is that it assumes a world that no longer exists—and perhaps never did: moderate-sized communities of civic minded, knowledgeable citizens with the time and desire to follow politics closely. DeLeon's argument, then, that a rational science of policy ought to explore alternate mechanisms for maximizing civic participation, is a refreshing change. *Democracy and the Policy Sciences* is an excellent read, perfectly suited for use in graduate seminars and for policy scholars with an interest in the normative concerns of building and maintaining democratic institutions. DeLeon offers a useful review of democratic theory and the evolution of the policy sciences, and he ultimately offers a "tapestry" (p. 99) of approaches that are reflective of participatory policy analysis in an effort to "advance the policy sciences in ways that they will contribute positively to . . . democracy" (p. 11).

In summation, both these books have an engaging style and initiate normative contemplation that ultimately links democratic theory to the applied concerns of the policy literature.

In this, Schneider, Ingram, and DeLeon persuasively remind policy scholars and professionals alike that we are not merely mechanics responding to the pervasive but ambiguous rattling of the body politic. Rather, public policy manifests the tools of a living civilization and therefore must incorporate the organic values and extant expectations of a still evolving civic democracy. Should the policy sciences abdicate their responsibility to encourage, prod, and facilitate democratic institutions and civic participation, we are doomed to the tyranny of technocrats.

Gender Power, Leadership, and Governance. Edited by Georgia Duerst-Lahti and Rita Mae Kelly. Ann Arbor: University of Michigan Press, 1995. 305p. \$47.50 cloth, \$17.95 paper.

Sue Thomas, *Georgetown University*

The literature on women officeholders—elected and appointed—has evolved tremendously over the past 25 years. During the first stage of research on this topic, scholars focused on sociological differences between women and men who held office. Attention was paid to educational and occupational backgrounds, ambition levels, points of entry into politics, and family status. The second research stage illuminated questions of differences in voting record, ideological proclivities, issue support, sense of women's status in the political realm, and activity levels on routine legislative tasks. The third stage, moving toward issues of women's influence in legislative life, concentrated on differences between women and men in policy priorities, success levels of bill introduction and passage, and proportionality—or whether a higher concentration of women was likely to mean greater focus on women-centered legislation.

Rapidly expanding is the fourth stage, which questions the gendered nature of institutions themselves and the sort of effect women can have in places and with processes that are masculinized. Central to this debate is *Gender Power, Leadership, and Governance*, edited by Georgia Duerst-Lahti and Rita Mae Kelly. The editors offer five purposes for the volume, chief among them that concepts of gender power are central to analysis of government and governance and that institutional sexism leads to differential gender power and to differential political power. Underlying these aims are the fundamental arguments that feminism and masculinism are more than ways of being; they are ideologies. Because masculinism is considered the norm, men and masculinity are given the privileged positions in society and politics.

To illustrate their reasoning, the editors offer chapters organized into various sections. Part Two explores the important difference between sex and gender, the former being a biological construction, and the latter a social one. Two empirical questions are raised in these chapters: why there are so few women in top political positions, and how women's influence in legislatures can be measured. According to Cheryl King, answers lie in notions of the compulsory masculinity that operate in political institutions, regardless of the sex of the officeholder. Karin Tamerius argues for the need to move beyond roll-call voting scales to assess the effect of women. Rather, indicators should include operations at all phases of the legislative process and analysis of the differential resources that women and men bring to bear on the process.

Institutional sexism and structural barriers to women's equal participation are the focus of Part Three. The chapter by Noelle Norton on the importance of committee positions proposes an augmentation to existing literature on women

legislators' influence on policy outputs. Her point is that agenda control is related to issues of institutional sexism and that, at a minimum, women need to hold enough positions of power to be able to put the issues most important to them in the foreground. Meredith Newmann analyzes conventional political science wisdom about the work of policy agencies and suggests that typologies such as Lowi's are deeply imbued with gendered assumptions which affect both clients and those in leadership positions in the bureaucracy.

Another long-neglected aspect of gendered institutions is what Duerst-Lahti and Kelly call the "interpersonal dimension." How and how much can and do women participate when psychological power in political institutions still resides with men? Whether the issue is verbal communication patterns and practices or sexual harassment, the silencing effects can be dramatic. Lyn Kathlene's chapter highlights how communication styles in legislatures are dominated by men, even when women are committee chairs. Her work once again calls into question the influence of women in legislatures, given the underlying and unquestioned norms of masculine hegemony. More overt is the psychological warfare of sexual harassment. Rita Mae Kelly illustrates how leadership by women can be undermined by instances of workplace intimidation and harassment. That direct link between performance and safety provides yet another example of what has long been called "the chilly climate for women" in the public sphere.

Part Five offers analyses of the symbolic meaning accorded women's presence in politics. Georgia Duerst-Lahti and Dayna Versteegen discuss the much heralded "Year of the Woman," and Mary Ellen Guy writes about Hillary Clinton's foray into the health care debate. The underlying issue in both chapters is boundaries. Are women overstepping them, in the case of Hillary? Or are women so excluded that the spectacle of an all-male Senate Judiciary Committee debating allegations of sexual harassment brings the lack of descriptive representation of women in Congress squarely into the 1992 election cycle?

Whether talking about legislators, bureaucrats, or executives, the contributors to this volume ground analyses of women's place in politics in the metaideology of masculinism and its effect on women's presence, actions, influence, and future. The editors conclude by asserting two claims. The first is the need for gender-balanced, not just sex-balanced, political institutions. Without it, the perspectives, influences, and contributions of some of our citizens are muted or excluded. The resulting price is a high one and is paid both by those with privilege and those without it. A final, highly relevant point for political scientists concerns the need for researchers to analyze politics through a gendered lens, whether or not their research concentrates directly on issues of women in politics. A full understanding of the nature of power and the realm of politics is not possible until gender is part of the fundamental basis for all exploration. These points are so well taken that they cannot be made often or insistently enough. Because of them, *Gender Power, Leadership, and Governance* is an important addition to the literature.

Women's Political Voice: How Women Are Transforming the Practice and Study of Politics. By Janet A. Flammang. Philadelphia, PA: Temple University Press, 1997. 419p. \$69.95 cloth, \$24.95 paper.

Mary Hawkesworth, *University of Louisville*

In characterizing our scholarly investigations as a mode of scientific inquiry, political scientists claim to generate objec-

tive accounts of the political world. Sophisticated methods, replicability, and falsifiability are relied upon to ensure the objective validity of the discipline's scientific claims. The critical, nondogmatic, disinterested pursuit of truth is the standard set for well-trained political scientists, and the constant examination and testing of competing hypotheses constitute the means to achieve the standard.

How well does the discipline of political science live up to this regulative ideal? In *Women's Political Voice*, Janet Flammang provides compelling evidence that it falls far short of the mark. Her comprehensive overview of thirty years of feminist scholarship on American women's political behavior demonstrates that mainstream political science is riddled with erroneous claims about women and about American politics, that androcentric bias permeates supposedly "neutral" methods of inquiry, surfacing in problem selection, research design, definition of key concepts, decisions concerning relevant evidence, and counterevidence, data collection and analysis, and interpretations of results. Flammang carefully documents feminist scholars' refutations of the discipline's conventional views and shows how research on the political experiences of women and people of color, the majority of American citizens, changes the categories of political analysis and the substantive understanding of American political life.

The book is structured to engage the discipline's dominant paradigms in the areas of mass politics (political mobilization and political participation studies), elite politics (political recruitment, policy preferences, and political styles of male and female elected and appointed officials), and elite-mass interaction (agenda setting and the development and maintenance of political coalitions). Within each area of investigation, Flammang illuminates the means by which deeply entrenched disciplinary assumptions preclude political scientists from attaining an objective account of women's political involvement. She demonstrates, for example, how the state-centered paradigm of proponents of an institutional definition of politics and behaviorists' restrictive focus on interest groups, parties, and elites converged to render invisible 150 years of political mobilization in the women's movement. She shows how gender stereotypes substituted for empirical analysis in early studies of female voting behavior, generating unsubstantiated claims that wives followed their husband's lead in casting their ballots. She points out that survey researchers' accounts of male feelings about politics sustained claims about men's greater political participation in years when females were devoting more hours to the work of political parties and were casting more ballots than men. She demonstrates how reliance on roll-call analysis as an indicator of legislative performance underestimates the difference female legislators make with respect to the substantive representation of women's interests.

In addition to refuting erroneous claims, Flammang sifts through hundreds of feminist studies of women and politics to generate a portrait of female political activism and a systematic account of the obstacles to equality women still confront in American politics. In so doing, she suggests that women's understanding of their political action raises important challenges to the received view of politics in the discipline. In contrast to the instrumental assumptions of the self-interested maximizer that undergird rational choice and pluralist approaches to politics, women continue to explain their political behavior in terms of efforts to achieve the public good, social justice, and meaningful equality. In contrast to the trustee/delegate/politico and broker/ritualist/inventor typologies of the legislator's role, studies of women legislators suggest that a more complex set of categories are

necessary to capture their behavior. And in contrast to the discipline's emphasis upon interest groups and policy entrepreneurs, or the "national mood" and elections as keys to agenda setting, the complex interaction between grassroots activists in the women's movement and feminist policy networks suggests a markedly different model of agenda setting.

It is impossible to do justice to the richness of Flammang's account in a short review. But it is important to note that *Women's Political Voice* succeeds admirably on a number of different levels. It provides a sophisticated account of the central epistemological and methodological issues that divide mainstream and feminist approaches to political science. Indeed, Flammang suggests that these issues help explain the failure of the discipline to engage the refutations and counterevidence advanced by feminist scholars. The positivist presuppositions that inform mainstream approaches in political science provide a form of methodological immunity against the postpositivist arguments of feminist scholars.

The book also examines two markedly different feminist approaches to the study of women and politics. Extrapolating from a framework developed by Sandra Harding in the *Science Question in Feminism* (1986), Flammang contrasts the works of feminist "accommodationists" (who believe the discipline requires only marginal adjustments to accommodate women's political practices) and feminist "transformationalists" (who believe the discipline must undergo major epistemological and methodological changes to capture the full range of women's political experience). Although Flammang makes every effort to be fair in her treatment of "accommodationists" and to demonstrate the important contributions they have made to an understanding of women and politics, she builds a consistent case for the superior merits of the transformationalist arguments.

Flammang also does an excellent job in bridging the gulf that too frequently divides feminist empiricists from feminist theorists. She lucidly demonstrates the emergence of debates in feminist theory from the complex political struggles within the women's movement. In turn, she uses arguments drawn from feminist theorists to illuminate policy stances and political strategies of feminist political activists. She provides the best discussion of feminists' continuing struggle to come to grips with issues of race, class, and ethnicity that I have seen. Her sensitive treatment of the legitimate claims of feminists of color includes important insights drawn from the works of African American, Asian American, Latina, Chicana, and Native American women activists and theorists. The singular omission from her comprehensive analysis of feminist coalitions and the "hard work of sisterhood" is a sustained discussion of lesbian feminist struggles within the women's movement.

Throughout the work, Flammang also develops a case study of Santa Clara County, California, "the feminist capitol of the nation," in order to show how transformationalist feminist political research illuminates problems for investigation occluded by the dominant disciplinary paradigms and affords richer explanations of women's political practices than mainstream accounts.

Women's Political Voice is a model of postpositivist scientific inquiry, employing theoretical insights and a range of methods to structure empirical investigations of contemporary politics. The account of political life it affords seriously challenges the adequacy of numerous disciplinary paradigms. In depicting alternative conceptions of and possibilities for political life drawn from women's political experiences, it raises the question of the discipline's complicity in producing and enforcing an overly narrow construction of the political world. In her even-handed examination of a wide range of

evidence and argument, Janet Flammang embodies the highest standards of scholarly investigation, and she affords the discipline of political science an opportunity to reexamine its dated presuppositions and test its status as a scientific endeavor.

Everson Revisited: Religion, Education, and Law at the Crossroads. Edited by Jo Renée Formicola and Hubert Morken. Lanham, MD: Rowman & Littlefield, 1997. 242p. \$63.00 cloth, \$23.95 paper.

Lief H. Carter, *Colorado College*

In 1947 the U.S. Supreme Court announced, in *Everson v. Board of Education*, that the Constitution's Establishment Clause obligated the states to maintain the metaphorical wall separating church and state. In the same majority opinion, however, Justice Black concluded that state funding of bus transportation of students to and from Catholic schools did not breach the wall. Just as *Korematsu* (1944) had prefaced with a stern warning against racism its approval of the blatantly racist internment of Japanese-Americans during World War II, so many feared that *Everson* had produced a rhetorically camouflaged defense of public support for private sectarian schooling.

1997 marked the 50th anniversary of *Everson* and occasioned the ten original essays published here. In the cases both of racial discrimination and church-state relations, we now know that the rhetorics of *Korematsu* and *Everson* have displaced the precedential authority of their factual holdings, but neither area of constitutional law has settled into unquestioned public policy. For those who seek to formulate workable policies regarding the role of religion in public and private schooling, these essays are useful stimulants to rethinking creatively the major policy problems in that field, and especially policies concerning school vouchers.

These essays range very widely, from Daryl Fair's engaging if journalistic recounting of the New Jersey political forces that produced and shaped the actual *Everson* litigation, to attorney William Bentley Ball's memoir on his uses of the *Everson* precedent when he litigated subsequent Establishment Clause cases, to Robert Booth Fowler's provocative "skeptical postmodern defense" of government aid to religious schools. These essays do, however, have a central tendency. Five of the ten authors teach at schools with specific religious affiliations, and their writing pushes toward more accommodationist and less separationist readings of church-state relations.

Thus, Stephen Monsma of Pepperdine describes the *Everson* rhetoric of separation as "the wrong road taken." Jo Formicola of Seaton Hall provides a balanced and (for this non-Catholic) fascinating insight into "Catholic jurisprudence on education." Formicola both describes the efforts of the Catholic Church to develop a coherent position on Establishment law and the practical choices that the church must make, such as the obligation to honor diversity requirements when a Catholic school participates in student-loan programs. Hubert Morken, a biographer of Pat Robertson and founder of the Religion and Politics section of the APSA, traces Evangelicals' rejection of current separationist doctrine back to Horace Mann and the importance of nonsectarian religion in the programs of the old "common schools." Angela Carmella, a professor at Seaton Hall law school, and Mary Seegers, of Rutgers-Newark, provide legal, political, and theological background for understanding several proposed versions, particularly that of Rep. Dick Armey, of the Religious Equality Amendment.

These essays by no means tilt toward a fundamentalist campaign for "getting religion back in the schools." While Daniel Dreisbach's essay bemoaning the Supreme Court's failure to read the history of the Establishment Clause accurately has a Bork-ish slant, Derek Davis's argument rejecting mandatory moments of silence in public schools (a practice which Establishment doctrine now presumably permits) balances Dreisbach's tone. The editors judge *Everson* as a desirable political event, if only because its ambiguity keeps alive debate over the many different practical applications of separationist and accommodationist views of religion in public life, but they also call for "a reorientation of the relationships between public education and religion and between private education and the state" (p. xii).

While these essays may well help educators who confront church-state political controversies in schools to think more clearly and creatively about their options, I have some difficulty imagining other academic audiences for which they will be useful. The problems with this collection may be endemic to any collection of essays that tries to focus on a "loaded" political topic from varying perspectives. The essays must be short, but that means neglect of interesting academic treatments of such matters, for example, LaRue's analysis of *Everson* in *Constitutional Law as Fiction* (1995). And there are the redundancies, the repeated descriptions of *Everson*, *Lemon*, and the familiar march of Establishment cases in the last 50 years (described not unlike biblical sequences of begattings). We read several times that Justice Jackson, dissenting in *Everson*, equated the majority opinion with Byron's Julia, who, "whispering 'I will ne'er consent,'—consented." Brevity obligates many of these essays to presume that readers have prior knowledge of the key cases in the field, but readers with no prior training in constitutional law will have to struggle to follow some arguments precisely.

Readers who do bring a background in constitutional law and practice to this collection will find some conceptual confusions and omissions frustrating. The central confusion arises from the strain to make the collection "about" *Everson*. Thus, the preface asks "whether *Everson* will continue to create problems within American society, or whether it will solve them" (p. xi). Some essays, such as those by Morken and Monsma, suggest that *Everson* deserves some share of blame for the current state of schooling and of legal policy about religion in schools. But cases in isolation have no such linear power and influence. In hornbook legal reasoning, stare decisis plays virtually no role in constitutional law. In constitutional practice, particularly in unsettled areas like this one, decisions flow from an immense complex of political and psychological influences, not the mechanistic application of precedent.

Many of the essays thus take the form not of political or policy analysis but of legal advocacy, a form with its own deeply biblical roots. With the exception of essays by Davis and Fowler, there is little if any acknowledgment of the political realities and power dynamics in public schools and on school boards when sectarian religious impulses hold power. Were these essays to analyze politically where Establishment law may go in the next decade (the "crossroads" in the book's subtitle), they would look at what the Court says and does now. Unfortunately, books cannot keep up with "now." Since this publication, the Supreme Court in the 1997 term overturned its rigidly separationist position in *Aguilar v. Felton*. The Court also overturned Congress's Religious Freedom Restoration Act. These cases will provide better clues for where Establishment and free-exercise policy may go than will railings about the failure of the Court to get First Amendment history "right" 50 years ago, especially in a case

that, on its facts, permitted state assistance to students in religious schools.

Because the bulk of these essays advocate legal positions, they omit much of scholarly literature. Dreisbach's criticism that the Court has fictionalized history (p. 33) cries out for references to arguments, such as those of LaRue (1995), that constitutional law inevitably does, and should, fictionalize. As legal arguments, these essays assume a clause-bound definition of doctrine, but other writers, including Ronald Dworkin and Sotirios Barber, offer strong readings of the Constitution as a whole that lead in very different directions than do debates over the *Lemon* test's interpretation of the Establishment Clause. For that matter, E.D. Hirsch's recent writings, particularly *The Schools We Need* (1996), omitted from Morken's essay, would greatly strengthen his case.

My vote for the best read in this collection goes to Robert Booth Fowler's "Skeptical Postmodern Defense of Multies-tablishment." He wisely sets aside the cases as piecemeal political events and turns to the critical question: Does not a commitment to a pluralistic and multicultural society necessarily entail a tolerance for religious groups? If so, does not this tolerance entitle religious groups to no less governmental support than the support other groups receive? But, he concedes, skeptical postmoderns reject religious explanations and world views out of hand. Why should they support the very groups that oppose them? His answer is compelling: If postmodern skeptics at least embrace the catholic respect for persons, then acceptance and support of those with whom we disagree must extend to the religious right. This may be the "essential test of whether we really do respect persons" (p. 186). It is to the credit of this volume's editors and authors that they maintain a tone of tolerance for and acceptance of those with whom they disagree.

Picking Federal Judges: Lower Court Selection from Roosevelt through Reagan. By Sheldon Goldman. New Haven, CT: Yale University Press, 1997. 488p. \$45.00.

Susan B. Haire, *University of Georgia*

The delay in filling the record number of federal judicial vacancies in the 1990s has led many scholars to reexamine the influences that shape the selection process. Fortunately, with the publication of Sheldon Goldman's book, political scientists now have available what will become the definitive work in this area. Well-written and meticulously researched, it pulls together many disparate pieces to provide a thorough knowledge base detailing the politics of selection. More important, this study offers a theoretical framework for understanding the dynamics of the appointment process.

Central to this framework is a straightforward conceptualization of presidential strategies in making the appointments. According to Goldman, the process of identifying a nominee to the lower courts can be characterized as advancing policy, partisan, or personal agendas. In the first case, judicial selection is used to support the president's policy goals. In the second, the appointments are vehicles for shoring up political support for the president or his party. In the third, personal friends or associates of the president are appointed. These considerations need not be mutually exclusive; the difference lies in the primary emphasis underlying the motives of the president and administration officials. Critics may challenge this framework as one that does not recognize the "uniqueness" of each administration's judicial selection process. Goldman's analysis addresses this issue by analyzing appointments at the individual judge level and recognizing that a president may advance different agendas at different times,

depending on the circumstances surrounding the appointment. The study makes clear, however, that in most administrations, a particular agenda dominates the procedures for identifying nominees.

After introducing the historical and theoretical perspective, Goldman presents a fascinating account of appointments made by presidents Roosevelt through Reagan. His research is exemplary in part because of his rigorous analysis of presidential papers, Department of Justice files, and other historical documents. Readers are given details on individual appointments as well as an understanding of the agendas adopted by the appointing president. For example, Goldman traces Roosevelt's appointment of Peter Woodbury to the U.S. Court of Appeals, First Circuit. Union leaders and officials in the administration, including Secretary Perkins, were opposed to the nomination, as they believed Woodbury was "antilabor." Unwilling to drop the nomination, officials in the Department of Justice analyzed 31 economic and labor decisions in which Woodbury participated as a state supreme court justice. (He was eventually confirmed.) Overall, Goldman finds that 24 of Roosevelt's 50 appointments to the appeals courts were in the policy agenda category, most of which occurred when the New Deal was being challenged. The book provides similar analyses of judicial selection processes of other administrations. Some readers will be surprised at what the analyses uncover, particularly with regard to varying levels of presidential involvement in the process. For example, contrary to the emphasis given by candidate Nixon to appointing "law-and-order" types to the federal bench, as president he paid almost no attention to lower court appointments and delegated much of the responsibility to John Ehrlichman.

In the analysis of each presidency, Goldman assesses the influence of participants outside of the administration who may affect the judicial selection process. Again, his careful analysis of historical documents provides a refined appraisal of the role played by home state senators and members of the Senate Judiciary Committee. Goldman's research documents a shift over time as administrations instituted procedures designed to strengthen the president's role in the selection of nominees at the expense of home state senators. The book also sheds light on the role of party leaders in judicial selection—an area previously unexplored by scholars. Goldman's work suggests a limited but important role here, particularly when administration officials attempt to make cross-party appointments. His research also chronicles the rise and fall (and rise and fall . . .) of the American Bar Association as a major player in the selection process.

Any research by Goldman would not be complete without profiles on the background characteristics of the judges on the lower federal bench. Perhaps what may interest scholars more, however, is his research on the actions of administration officials behind the scenes. For example, he documents several instances in which the names of women and minority candidates were suggested to officials in the Department of Justice and White House during the Eisenhower administration, but officials did not pursue these nontraditional candidates. Although a few female and minority judges were appointed during the Kennedy-Johnson years, Goldman's work clearly suggests that such candidates were not even given serious consideration until the Carter administration.

Overall, this research indicates that presidents generally do not use the policy agenda approach. With the exception of Roosevelt and Reagan, most presidents adopt partisan agendas in judicial selection. Goldman suggests these findings are related to the stability of the party system. He argues that during periods of party stability, presidents adopt partisan or

personal agendas. When the policies of the courts are seen as being out of step with an emerging new party system, presidents will adopt policy agendas. While these arguments are supported somewhat in his research, they are tenuous. Goldman himself acknowledges that the election of Nixon and his subsequent failure to adopt a policy agenda for lower court appointments suggest the limited utility of this explanation. Scholars in other fields of American politics also have debated when "party stability" exists and other issues in realignment (and dealignment), including the recalcitrant problem of where southern democrats in the 1950s and 1960s "fit" in a two-party system. Moreover, the relationship between party stability and judicial agendas may have changed beginning with the Reagan era, as judicial selection has become more contentious during periods of divided government. Additional studies will need to build on this, then, to develop our understanding of the appointment process as the dynamics that shape the selection and confirmation of nominees continue to shift in the 1990s.

Finally, Goldman's research also contributes to the scholarly literature because it highlights how much still needs to be done to develop our understanding of the links between selection influences and judicial behavior in the lower courts. Clearly, the conservatism of Reagan judges is not surprising given Goldman's description of the policy agenda adopted by administration officials. Yet, previous research also establishes the liberalism of Carter appointees in the lower courts, even though, according to Goldman, the selection process was not driven by a policy agenda. As scholars build models of judicial decision making, Goldman's work should be a constant reminder of the need to be more rigorous in accounting for the meaning underlying those "presidential dummy" variables.

The New Majority: Toward a Popular Progressive Politics.

Edited by Stanley B. Greenberg and Theda Skocpol. New Haven, CT: Yale University Press, 1997. 333p. \$30.00.

L. Sandy Maisel, *Colby College*

This book emerged from more than a year of discussions among a distinguished group of scholars and activists—all progressive Democrats—who are frustrated and dismayed by the course their party has taken in recent elections. Former Clinton pollster Stanley Greenberg and Harvard political sociologist Theda Skocpol were the catalysts for a group of more than a dozen who sought ways for their party to respond to the political environment of the current era and to achieve electoral success without abandoning the fundamental principles that they feel define the Democratic Party.

The theme of the volume is that a new majority in American national politics can be built by "championing the needs and values of American families striving for a better life in the face of unsettling changes. . . . People want to tame and channel changes that threaten the family, exacerbate racial conflicts, and separate the rich from all others" (p. 1). The theme is developed in an opening chapter by Skocpol and Greenberg and then in thirteen individual pieces, each of which examines a different aspect of the political agenda suggested. These articles are divided into three sections: The first contains five chapters that look at developing a new social contract between citizens and the government; the second has four chapters on how people can be brought back into the political process; and the third offers four discussions of different aspects of how this agenda will build a political majority. Quite an impressive undertaking!

The question is what to make of these suggestions, and the

answer rests on a decision about what criteria one should use to judge them. By any standard, they raise the level of political dialogue from the drivel that dominates the airwaves and print media to a far more lofty plane. These are serious pieces, based on careful analysis of historical trends and current problems. In this regard, Alan Brinkley's chapter on the history of public investment in economic development and Michael Sandel's on the American tradition of civic virtue and the conflict among progressives—between those who fear the "curse of bigness" and those who feel the national government must intervene to counter the consequences of concentrated economic power—stand out. Similarly, Ira Katznelson's effort to demonstrate flaws in the conventional wisdom concerning the dire future for the Democratic Party in the South deserves careful attention.

The chapter by William Julius Wilson, on recasting affirmative action into a program for affirmative opportunity for those who are socially and economically disadvantaged, and the one by Theodore R. Marmor and Jerry L. Mashaw, who examine the need for continuing programs of social insurance, each show how traditional Democratic programs have lost their popularity because of the ways in which they have been presented to the American public and how they can be redefined so that more will see their appeal. These and most of the other contributions add significantly to the public debate over the policies our national government should follow.

But in another sense, Marmor and Mashaw point to the flaw in this book as well. As they state in discussing social insurance programs, "the real issue here is not economics but ideology" (p. 88). And the real issue with this book is not whether the authors are correct; that I happen to agree with them is beside the point. The real issue is not whether they present a progressive agenda in well-reasoned terms (which they most frequently do) but, rather, that their difference with Will Marshall (*Building the Bridge: Ten Big Ideas to Transform America*, 1997) or even, I suppose, with David Frum (*What's Right: The New Conservative Majority and the Remaking of America*, 1996) or Newt Gingrich (*To Renew America*, 1995) is one of what one believes, not of what one can demonstrate to be conclusively right. The arguments for and against the merits of the positions they espouse rest on one's values and assumptions, not on social scientific analysis.

In addition, the editors suggest another criterion on which the positions should be judged: Is this a blueprint that the Democratic Party could adopt in order to form a progressive electoral majority? The chapter by Margaret Weir and Marshall Ganz, on successful patterns of how to reintroduce civic engagement, and the one by Miles Rapoport and Marc Caplan, on successful efforts at democratizing reform (based on their Connecticut experience), point to aspects of the blueprint that can meet their desired goal. Too much of what is suggested, however, seems like wishful thinking to the reader anxious for a game plan that will lead liberals back to victory.

In the final analysis, this book fails to deal with the distinction between the message and the messenger. The book is dedicated to Robert F. Kennedy, whose brand of politics inspired many of the contributors. As we approach 2000, they want their party to stand for what he represented in the late 1960s. They demonstrate well how progressive ideas can be reframed in the contemporary context. What they lack is a successor to Senator Kennedy who is willing to carry this message forcefully to the American people. I am afraid it is often the messenger, not the message, that the people hear.

Organizing for Foreign Policy Crises: Presidents, Advisers, and the Management of Decision Making. By Patrick J. Haney. Ann Arbor: University of Michigan Press, 1997. 183p. \$39.50.

James M. Scott, *University of Nebraska at Kearney*

Patrick J. Haney examines "the ways that U.S. presidents since World War II have organized and managed advisory groups during foreign policy crises and the ways that these groups, so structured, performed the tasks of providing information, advice, and analysis" (p. 1). Through this examination, Haney seeks to explore the links between structure and process, guided by the proposition that the "institutional model" established by the president "ought to have empirically discernible effects on the political process of decision making" (p. 47). To undertake this highly worthwhile effort, Haney uses a "case survey" method, which employs a set of questions to "interrogate" case studies of the Berlin airlift (1948), the Korea decision (1950), Dien Bien Phu (1954), Suez (1956), the Tonkin Gulf (1964), the Tet offensive (1968), civil war in Jordan (1970), the 1973 October War, and the Panama invasion (1989). The first group of questions is designed to reveal the organizational structure used by the president, relying on the "models" described by Richard Johnson (*Managing the White House*, 1974) and Alexander George (*Presidential Decisionmaking in Foreign Policy*, 1980). The second group of questions focuses on how well or poorly the advisory groups complete what Haney conceptualizes as the "generic tasks" of decision making (surveying objectives; canvassing alternatives; searching for information; processing new information; evaluating costs, risks, and implications of the preferred choice; and developing implementation, monitoring, and contingency plans).

Haney achieves his main purposes quite well—describing how crisis decision-making groups were structured and how they performed their decision-making tasks. In the third chapter, Haney concludes, for instance, that Truman and Nixon established a formalistic model, Eisenhower established a competitive-formalistic hybrid (largely formal in structure, but competitive in informal operations), and Johnson and Bush established a collegial-formalistic hybrid (collegial in the small group of top advisors, but formalistic below this level). In the fourth chapter, Haney reports that Eisenhower's advisory group generally performed well; that Nixon's advisory structure performed well in the 1973 October War, but had mixed results in the case of the 1970 civil war in Jordan; that the Truman and Bush structures displayed a mixed performance; and that Johnson's advisory group performed poorly (until its decisions after the Tet offensive). While this descriptive information is effectively presented in the main (Haney draws on a wide range of material from the numerous case studies on which he bases his analysis), *Organizing for Foreign Policy Crises* would be even stronger if Haney had included more in the way of description and detail about the nature and dynamics of the structures and processes in these crises, perhaps in place of some of the extensive literature and methodological reviews.

In addition, Haney advances the conceptualization of organizational structure and process, raises a number of interesting implications and suggestions for further research into crisis decision making, and offers a methodological contribution. Through his examination of structures, he provides insights on the need to go beyond the formal, competitive, and collegial ideal types, suggesting refinement and further specification to include additional, hybrid types. His conceptualization of procedural tasks establishes a useful benchmark for examining decisions and the performance of

advisory groups and offers an interesting and potentially fruitful avenue to expand our understanding of success and failure in decision making. Among the several implications and suggestions Haney derives from his analysis, his calls for study into the issues of crisis definition and construction are particularly useful. Methodologically, Haney's case survey approach represents a constructive way to harness existing, often atheoretical, single case studies to comparative, theoretical analysis. While his method is necessarily limited by the quality and focus of existing cases, Haney relies on multiple cases for each crisis, which strengthens his implementation considerably.

Haney is more tentative in his discussion of the link between (certain) structures and (certain) processes, which is probably the most theoretically significant aspect of the book. In general, Haney concludes that there is "no obvious, direct relationship between a particular advisory structure and the decision process that results" (p. 125). He does find, however, that the more collegial structures (Johnson and Bush) seem to be less effective in completing the procedural tasks well, and that the actual results for each organizational structure frequently fail to match what might have been expected, given the nature of each different model.

Here, some limitations to the analysis may be noted. As Haney indicates, all the presidents in question used the formalistic structure or some variation. Clearly, one area for future work would be to expand this limited variation by including crises from presidents who employed more purely collegial or competitive models. This might help identify a more obvious pattern in the relations between structure and process. Even in the evidence Haney has collected, the relationship may be more patterned than he indicates. The author presents a clear and cogent discussion of the results for each of the six procedural tasks in each individual crisis (see his summary tables 4, p. 86, and 6, p. 126), exploring how each advisory group performed. Organizing this data by organizational structure instead of crisis (i.e., procedural tasks—performed well or poorly—according to organizational structure used) would have allowed him to suggest that, among other things: (1) the formal and competitive-formal models seem more likely to complete the tasks well, and the competitive-formal hybrid seems much less likely to fail at these tasks; (2) the formal model does the first three tasks well more often than poorly, and the last three tasks poorly more often than well; and (3) the collegial-formal hybrid seems just as likely to complete the procedural tasks poorly as well. Hence, Haney may be too modest in his discussion of the links between structure and process that emerge from his analysis.

This notwithstanding, *Organizing for Foreign Policy Crises* suggests that factors other than structure are at least as important, and probably more so, in determining how well or poorly advisory groups perform certain tasks. For instance, Johnson purportedly used the same model in each of the crises examined, but it worked in the decisions after the Tet offensive and "failed" in those before. In addition, Haney's analysis shows that the formal model used by Nixon worked better when Nixon was not engaged and attentive (October War) than when he was (civil war in Jordan). The formal model also seems to have worked better under Nixon (or Kissinger) than under Truman, and the formal collegial model worked better under Bush than under Johnson. In the end, one is left with the unavoidable conclusion that such factors as the personality, style, and interest of the president and individual advisors matter most in the outcomes. As Haney concludes, presidential attention to management and process may be the critical factor (p. 130). Given this overall

finding, Haney could have devoted more attention to these explanations for the variation in the way procedural tasks were performed.

In the end, *Organizing for Foreign Policy Crises* is an interesting, useful, and provocative work that makes solid methodological, descriptive, and conceptual contributions, even if its contribution on the theoretical link between structures and processes is more limited. As Haney suggests, the presidency is "an institution that is intimately linked with its inhabitant" (p. 145), which perhaps offers direction to future explorations of crisis, structure, and process.

Executive Governance: Presidential Administrations and Policy Change in the Federal Bureaucracy. By Cornell G. Hooton. Armonk, NY: M.E. Sharpe, 1997. 274p. \$63.95.

Francis E. Rourke, *Johns Hopkins University*

This book challenges the principal explanations offered in the past for the rift that commonly divides a new president and his political aides from the career officials in the federal bureaucracy, as the two groups go about their joint efforts to put the nuts and bolts of policy together in the wake of a national election. Cornell Hooton believes too much of the earlier research on this conflict has a "top-down" perspective. It has examined this source of friction within the American policymaking system from the point of view of the president and those he has selected for service either at the White House or in one of the executive agencies. It has paid very little attention to the attitudes and activities of career employees in the ordinary bureaus of government, upon whose energy and skill the success of all presidential programs ultimately depends.

In an effort to correct this oversight, Hooton investigates the role of career bureaucrats in the development of transportation policy from the mid-1970s to the early 1980s. This was an area in which the incumbent president, Jimmy Carter, had strong personal preferences, and his views did not always coincide with those of senior career officials in the two transportation agencies on which Hooton's research focuses: the Urban Mass Transit Administration and the Federal Highway Administration. (Eventually, the study includes a third bureau within its orbit, the Food and Nutrition Service at the Department of Agriculture.)

A strong feature of the book is the light it throws on the operational styles or working procedures that prevail in government bureaus as they go about the difficult task of converting the plans proposed by political leaders into the programs needed to achieve these objectives. Hooton contends that much of what may appear to be defiance by bureau personnel of directives from the president or his political appointees may simply reflect the fact that the bureau's standard operating procedures do not easily lend themselves to pursuit of the policy objectives the administration is proposing.

As Hooton himself puts it: "This study argues that many of the difficulties of changing practice are attributable not simply or even primarily to the personal dispositions of career officials but rather to the normal characteristics of organizational behavior. . . . The existing training, expertise, and task orientations within a bureau favor certain policy options and slow the adoption of others" (p. 160). He contends that "a variety of attitudes, anecdotes and testimony suggests a willingness among career officials to support presidential administrations' policy directions" (p. 4). Moreover, it may be difficult "for an agency to change policy even when the career staff approves of the change" (p. 5).

Hooton believes that the attitude of the bureaucracies he examined toward administration policy was to some extent shaped by the compatibility of the proposals with the agency's standard operating procedures. This analysis is reminiscent of Graham Allison's celebrated study of the Cuban missile crisis in 1962, which held that policy decisions cannot be fully understood without taking into account the operational routines of the organizations principally involved in their formulation or execution. More recent events, such as the tactics of the FBI when it sought to arrest leaders of a religious cult at Waco, Texas, have given new life to the utility of this kind of analysis in explaining some types of agency behavior. The standard procedures of the FBI seemed ill-suited to attain even the agency's objectives in the Waco case.

Hooton's analysis of bureaucratic behavior is certainly a very useful supplement to other explanations offered for the troubled relationship between political appointees and career officials in the development of national policy. It does not, however, discredit alternative paradigms. It is clear, for example, that the differing roles played by these two sets of officials in the policymaking process can also engender considerable friction in their relationship, even if the bureau's standard operating procedures are in perfect harmony with the president's policy proposals.

For example, the very different time frames within which career bureaucrats and political appointees work in dealing with policy issues has often been a source of irritation for both sides. Presidents and their aides are constantly in a hurry, given the deadlines imposed by the political calendar. At the beginning of their tenure, a fast and successful start is needed to take advantage of the honeymoon period. At that point the White House can normally expect to benefit from a great deal of public good-will. This is also a time when constituencies whose support helped elect the president are pressing for quick action on policies they favor. Meanwhile, career bureaucrats may still be struggling with unsolved problems from the past.

Another source of division between the two groups is the fact that the presidential aides with whom career bureaucrats ordinarily deal report to one principal, the president himself, while bureaucrats also are responsible to numerous other principals, including the courts, the clientele groups that have a stake in the agency's decisions, and the congressional committees that oversee an agency's activities and supply it with appropriations. Hooton provides evidence that the obstacles to a harmonious relationship between the bureaucratic and the political sectors of government in this country are even more formidable than previously imagined.

The Manipulation of the American Voter: Political Campaign Commercials. By Karen S. Johnson-Cartee and Gary A. Copeland. Westport, CT: Praeger, 1997. 232p. \$55.00.

Karen M. Kedrowski, *Winthrop University*

Johnson-Cartee and Copeland attempt an important task. Their purpose is to bring together the disparate literatures of political science, political communication, and production to analyze political campaign commercials. Their point of departure is that each of these disciplines has unique insights that should be brought together in one volume for the use of interested scholars in each field. Interestingly, both authors are academics who have also worked as professional political consultants—making some of the very "polispots" (their term for political campaign commercials) that they analyze here.

I looked forward to reading the book, especially given the practical experience that the authors brought to the table, but

I was disappointed. The authors state that their book provides a "narrative analysis" (p. xxi). "Narrative" is accurate. Each chapter draws upon an exhaustive amount of literature. There is endless discussion of the different types of political ads and their intended purpose. Several chapters have elaborate typologies of ads. For example, the authors developed six types of positive ads; three modes of negative ads; two types of inoculation ads and eight types of negative reactive responses; fifteen types of "American myths" used in ads; twenty-one types of "persuasive appeals"; and sixteen different styles. There are transcripts of ninety-seven polispots to illustrate the categories.

The problem enters with the definition of "analysis." Certainly, constructing typologies is a form of analysis, but there is no attempt to go beyond these elaborate, lengthy, and at times complex constructions. For instance, the authors provide no systematic analysis of ads to determine which types are used most frequently and which are most effective.

Similarly, Johnson-Cartee and Copeland repeatedly discuss the intended purpose of the various polispots and televisual techniques but do not indicate how they reached these conclusions; presumably they are the authors' own impressions, rather than the product of focus groups, systematic content analysis, or some other method. Likewise, the book contains no interviews with the political consultants who produced the polispots to see if their intended purpose was the same as the authors' conclusions. It is certainly possible that a political consultant meant to send a message that was not perceived in the intended way by the audience, or by the authors. In one instance, the authors even intimate such a possibility (p. 132). There is no attempt to analyze the ads from this perspective.

There is very little discussion of the extensive political science literature on whether exposure to political campaign commercials makes a difference in vote choice or the decision to vote. Given the title of the book, a chapter demonstrating that ads do indeed "manipulate" seems necessary. Instead, only occasionally do Johnson-Cartee and Copeland remark in passing, and often without citation, that airing a particular ad may have affected public opinion polls or increased candidate name recognition.

The book lacks any sort of overarching conclusions about the diverse and extensive literature surveyed. The narrative analysis produces a lot of trees, but the authors do not help the reader visualize a forest. Similarly, a concluding chapter could have been used to make some sort of normative statement about the implications of manipulating voters through political ads. Obviously, Johnson-Cartee and Copeland (and many candidates for office) believe that polispots have some effect on voters. In fact, many politicians believe that the enormous expense of producing commercials and purchasing advertising time is a major factor in the high cost of today's political campaigns, which arguably keeps many qualified potential candidates from running. Yet, the authors fail to offer any opinions or conclusions about the appropriateness of polispots in today's political discourse. Instead, this book stops rather abruptly at the end of the last substantive chapter.

Nonetheless, the book is not without merit. In the chapter on negative ads, Johnson-Cartee and Copeland make the point that these have become synonymous with "mudslinging" in the mind of the public and academics. They argue that critical attack of opponents is a legitimate political strategy that can educate voters about important facts. Thus, "negative" ads should not be considered illegitimate or misleading. Their point is well taken, and their discussion is well worth reading. Similarly, the chapter on the power of recorded

visual images, which focuses on camera angles and compositional techniques used by political consultants to create different effects is excellent. Political scientists are unlikely to be familiar with this literature, and the chapter summarizes the material nicely.

In sum, the book has some value as an exhaustive literature review, but it makes no new contributions and does not attempt to draw any conclusions from existing information.

Budgeting Democracy: State Building and Citizenship in America, 1890–1928. By Jonathan Kahn. Ithaca, NY: Cornell University Press, 1997. 222p. \$42.50.

Charles Stewart III, *Massachusetts Institute of Technology*

For the same reasons a fish does not know it is wet, the modern American political observer is probably unaware that politics at all levels is enveloped in the budgetary reform baggage left over from the turn of the century. The value of Jonathan Kahn's *Budgeting Democracy* is its careful recounting of the process that transformed how Americans perceived government taxing and spending in the early twentieth century, which in turn altered how policy conflicts large and small have played out over the past century.

The general story of how the federal government got a budget is fairly well known among students of American national institutions: The Taft Commission begat a congressional reform effort, which begat the Budget and Accounting Act of 1921, which begat the president's budget. Before 1921, federal agencies made their spending appeals directly to congressional legislative committees, bypassing the president (and often the Appropriations Committee, too). Taxes were not even mentioned when appropriations requests were made. After 1921, all appropriations requests were channeled through the president (who actually had the power to change them), who made a set of revenue estimates that were reported to a single committee in each chamber of Congress. Both the Congress and the executive branch received new auditing capacities. An appropriations process was replaced with the budget process. Presumably, appropriations politics were replaced with budget politics.

Kahn's examination of turn-of-the-century budget reform pushes the empirical case back before the well-known national reform effort by focusing on the earlier movement to reform municipal budgeting. Here, the history is longer, more varied, and in many ways more interesting. Young reformers, imbued with a moral dislike of machine politics, armed with knowledge of the modern management practices that were overtaking large industrial concerns, and confident in an ideology that focused accountability in the hands of a few well-trained experts, whittled away at the standard government practices of the big cities, especially New York.

The focal point of this reform effort was the New York Bureau of Municipal Research, which served as the holding company of some of the best-known personalities of early-twentieth-century reform, such as Frederick Cleveland, William Allen, and Henry Bruere. Within the orbit of the bureau were such important academics as E.R.A. Seligman and Charles Beard. The Bureau of Municipal Research was largely successful in altering the fiscal institutions of the city through a combination of sheer energy, managerial talent, and public relations savvy. On this latter point, we have some of the most entertaining reading in the book. The bureau began sponsoring public exhibitions to publicize and illus-

trate the issues at stake in the annual New York City budget consideration. When the city took over the enterprise in 1911 (learning from successes of previous bureau exhibitions), it rented an old dry-goods warehouse and filled it with charts, models, graphs, multicolored cubes, and pictures to bring the city budget to life. Seeking to include the whole family, Brentwood, "a twenty-one-year-old horse that had served the fire department faithfully (and, of course, efficiently) for seventeen years . . . was tethered outside, in front of the building" (p. 108), to the delight of city children.

It was the experience with budgeting in New York—both the politics of creating a budget for the first time and the mechanics of implementation—that made the leap from New York to Washington inevitable. Keep in mind that during the early years of the century, the scale of New York City's budget and the federal budget were not wildly different, so success in one realm was an obvious predictor of success in the other. Grover Cleveland, particularly, was detailed to the Taft Commission, which provided the intellectual ammunition for the federal reform effort of the 1910s and, ultimately, the momentum for the passage of the federal Budget and Accounting Act.

Political scientists trying to understand American "state-building" will find a plethora of information to help round out the account of how the U.S. government acquired the trappings of the modern state early in this century. The book provides a much-needed corrective to the current literature, which has focused on the building of governing capacity in national institutions. Kahn makes a convincing demonstration that if you were a politically aware American in 1910, you would be much more interested in developing capacity at the local level, where things actually happened, rather than in sleepy old Washington. Tip O'Neill's aphorism, "all politics is local," turns out to apply to national budget reform as well.

This is a helpful book, though it is not as thorough as it might have been. Two important arguments remain underdeveloped. First, running throughout the book is an explicit criticism of the model of representation implied in the reformers' efforts, coupled with a claim that the real import of municipal reform was the shifting of government benefits away from the working class and recent immigrants toward the urban middle and upper classes. While this latter claim may be true, it is weakly supported by the evidence in the book. Certainly, the New York City budget reforms had real distributional consequences for residents and interests residing in the city, but no systematic evidence is adduced to examine these assumed distributional consequences.

Second, a not-so-subtle conspiratorial ingredient is added to spice up the narrative stew. Budgets are claimed to have "eased the crisis of representative democracy by creating a new myth of representation which secured the acquiescence of citizens in the increased exercise of governmental power over their lives without supplying them with any more real control over that government" (p. 5). Americans have acquired a "fixation" on budgets, which has created a new crisis of representation today.

However one may feel about these normative claims, very little in the book sustains the point one way or the other. Representation is a complex thing, and simply showing that one set of reformers succeeded in pushing the emphasis along one dimension (and may have had designs to push it even farther) is a long way from demonstrating that democracy is undermined when the capacity for synoptic planning is expanded.

A major theme in the literature on American state-

building is that the case for U.S. exceptionalism rests on the highly fragmentary nature of American politics. The fault line usually examined is the one that separates national governing institutions. The contribution of *Budgeting Democracy* comes in exposing the fault line that emerges because of federalism. That alone makes this book a valuable addition to the canon of American reform politics.

Liberty, Property, and Privacy: Toward a Jurisprudence of Substantive Due Process. By Edward Keynes. University Park: Pennsylvania State University Press, 1996. 238p. \$40.00 cloth, \$16.95 paper.

Keith E. Whittington, *Princeton University*

This is a work of advocacy, but advocacy of a peculiar kind. The author is ultimately concerned with defending a version of substantive due process and with using that reconstituted notion of due process to criticize and reformulate recent decisions by the Supreme Court. Keynes pursues this point, however, through an extended history of historical reasoning, legislative debate, and jurisprudential rulings on the meaning of the due process clause and its precursors. This approach provides a welcome relief from competing polemics attacking and defending recent judicial rulings, and it is a useful history that will be of interest to many with no particular stake in current doctrinal jousting. The book's argumentative goals emerge and recede again as the historical evolution of due process understandings is traced. The result is an interesting and highly readable history of substantive due process in the national government, but one that may not be very likely to convince readers to change their views on how the clause should be interpreted in the current context.

The book traces the evolution of thinking about the cluster of concerns surrounding due process from the colonial period through the Court's recent abortion decisions. Keynes hopes to show that "due process includes a substantive as well as a procedural component" and that the substantive component is not confined to a narrow set of "specific liberty or property interests" (p. x). In developing this substantive component, Keynes argues that those rights are best conceptualized as conditional rather than absolute and as rooted in fairly concrete historical sources and not simply in abstract moral reasoning. He finds support for these contentions in a variety of sources, ranging from historical legal commentaries, to constitutional texts, to judicial doctrines, to the debates of constitutional drafters. Keynes works through several chronological periods—from before the Civil War, through Reconstruction and the drafting of the Fourteenth Amendment, through the rise, fall, and second rise of substantive due process jurisprudence. In overviewing each period, Keynes is concerned both with establishing his central concerns using the historical evidence and with arbitrating among the numerous scholars who have examined this material.

Keynes breaks little new ground in examining the historical material, but his discussions are clear, full, and well written. As an introduction to substantive due process and the debates over due process, the book succeeds admirably. Because this is ultimately a work of advocacy, however, Keynes sometimes seems to stretch to make his points, often unnecessarily. For example, due process language is too often identified with constitutionalism more broadly. Keynes blurs important distinctions in claiming that, because early American constitutions both recognized "substantive limits on the power of government" and included due process language, the due process clauses were therefore substantive guarantees and not simply procedural (pp. 18–19). That the

founders undoubtedly intended to protect life, liberty, and property did not necessarily mean that they regarded the due process clause as more than a procedural guarantee. Similarly, his post-Civil War analysis elides distinctions between equal protection and due process concerns, often underestimating the independent significance of the former in order to establish or emphasize the substantive component of the latter.

Such quibbles with the historical presentation are not crucial to evaluating the normative goals of the book. The motivating concern of the work is with contemporary jurisprudence, and Keynes hopes to persuade his readers that the modern Court has adopted a "fundamentally flawed" approach to thinking about rights and the powers of the state (p. xii). Central to those modern flaws is the fact that judges are forced "to act like legislators" in employing modern doctrine, while often producing incoherent or misleading opinions to rationalize outcomes (p. xii). The original substantive due process logic of the Reconstruction Republicans and the *Lochner*-era judiciary provides a compelling alternative, in Keynes's account. As many recent revisionist studies have concluded, the *Lochner* Court was far more principled and far more restrained than is commonly believed. The multifaceted reasoning of the first wave of substantive due process jurisprudence, rooted in a common law tradition and the concrete historical intentions of the framers of the Fourteenth Amendment, provided an exemplar of principled, coherent, and sustainable judicial protection of individual liberty.

The historical approach is not well suited to establishing this normative case, and the necessary normative arguments are never extensively developed. Readers are left to their own devices in answering key questions regarding the viability and desirability of Keynes's normative project. Why should we be particularly concerned with the state of recent due process jurisprudence? Even if the framers of the Fourteenth Amendment had substantive liberty commitments derived from common law, natural law, and social contract theorizing, why should we be either guided by or constrained by their particular understandings of either the sources or extent of individual liberty? Such fundamental questions about the status of judicial review and constitutional interpretation could perhaps be laid aside in order to follow Keynes's interpretive recommendations, but even here the argument is frustratingly partial. What should we make of the fact that substantive due process doctrine was being developed in dissenting opinions in the immediate postbellum era and was only embraced by the Court decades after the Reconstruction-era thinking that presumably determined its meaning? Given that the substantive due process commitments during Reconstruction were specifically economic, how should that logic be applied in the modern context? What survives of the animus against "class" legislation, and how should that idea be applied in the context of government regulation of sexual activities? How much deference should be shown to legislation that has some connection to a legitimate state power but serves primarily to advance the interests of some citizens at the expense of others? The author's discussion is not helpful in answering such questions, not only because they are largely left unexamined but also because they are often implicitly waved away. The book is filled with assertions that various pieces of legislation were simply "irrational" or "arbitrary" (e.g., pp. 168, 173, 178). Not only are such claims usually far from obvious, but also they hide whatever reasoning might go into rendering such decisions. Labels of that sort often substitute for analysis and do not build confidence in how

such a jurisprudence would improve either the Court's reasoning or its political standing.

This book is a useful introduction to the evolution of the due process clause and its interpretation over the course of American history. It will take quite a bit more work, however, to move us "toward a jurisprudence of substantive due process," as the book's subtitle promises.

Turf Wars: How Congressional Committees Claim Jurisdiction. By David C. King. Chicago: University of Chicago Press, 1997. 207p. \$34.00 cloth, \$15.95 paper.

Bryan D. Jones, *University of Washington*

In graduate school, I swore that I would NEVER, but NEVER, study two topics: urban services ("count manhole covers") and congressional committees. Having done both, I plead that things changed: Both were far more interesting than I thought, and both illuminated fundamental processes of governance while still remaining empirically tractable. David C. King's book will ensure that no graduate student will again swear not to study congressional committees, at least. He not only has produced a seminal work on the committee system but also has done it in a way that makes the whole process exciting and interesting to anyone with any interest at all in Congress.

I want to argue, however, that King's book is worthy of study not just by students of Congress or American national institutions. It ought to be examined generally by political scientists because of the processes of democratic governance that it illuminates. To make this case, I point to four reasons this is a critically important book on Congress.

First, *Turf Wars* is above all a study of the dynamics of jurisdictions. King argues that jurisdictions have both a statutory base (assigned by chamber rules—Rule X in the case of the House) and a common-law base (how the Office of the Parliamentarian refers bills to committees). Common law jurisdictions are necessary because the issues that face Congress are not fixed, and committee entrepreneurs have motive to claim new "property rights" as they emerge. As a consequence, committee jurisdictions are not fixed; they evolve in response to the emergence of issues and the activities of congressional entrepreneurs. Most jurisdictional differences, King claims, occur when new issues emerge; there is very little conflict over established jurisdictions. But, viewing jurisdictional rules as "dynamic or adaptive documents" (p. 4) over extended periods means that great changes in jurisdictional arrangements occur. Moreover, statutory changes generally ratify already accomplished common-law alterations.

King goes on to detail the strategies that are more successful in influencing the referral of bills to committees. The discussion is not only a how-to manual for members of Congress but also illuminates the criteria used by the Parliamentarian in the referral process. The most successful strategies are directed at establishing either expertise (including interest and the willingness to commit resources) or the issue's jurisdictional proximity to the committee.

Second, *Turf Wars* is a historical and empirical study of the Office of the Parliamentarian. King's careful depiction of the House moving toward a nonpartisan officer making judgments about committee jurisdictions can give no aid and comfort to the party cartel model of Cox and McCubbins.

Third, King speaks to a major fault line in theorizing about Congress. Not content to stop with a superb analysis of jurisdictional dynamics among committees and the role of the Parliamentarian, King comments on current debate about

the function of the committee system. Does it provide an "informationally efficient" mechanism for chamber majorities to understand the effect of policies, or does it establish a mechanism for reelection-driven legislators to enjoy "gains from trade" among policy specialist committees? King sees the committee system as a collective good that can be undermined through member defection, which leads him to favor the informational viewpoint. While King's careful empirical study of the precursors of entrepreneurial activity on the new issue of mag-lev trains (chapter 6) supports the distributional model, the assignment of bills to committees seems more to conform to an informational efficiency ideal.

Fourth, the book is more than a study of Congress. It is an implicit (and occasionally explicit) argument about the evolution of governing institutions. Regardless of the "three theories of Congress" notion that permeates recent discussions, I claim that political scientists can no more have a theory of Congress than economists can have a theory of General Motors or astronomers can have a theory of Jupiter. Surely, theory is more than this. What would a general theory of governance look like? King has laid out many of the elements of an evolutionary theory of institutional change, one whose context is the tractable problem of congressional committee jurisdictions. He is not as explicit here as on the other points I have summarized, but a reader does not have to strain to find it.

The key is King's view that jurisdictional rules are "adaptive documents" (p. 4). The following are some of his key findings that speak to an evolutionary approach.

- Reforms follow, rather than proceed, the incremental evolutionary process of jurisdictional change.
- Jurisdictions are path dependent.
- The office of the Parliamentarian evolved historically to "solve" the collective goods problem of maintaining a committee system; yet, the Senate was unable or unwilling to use the same depoliticized approach.
- Members of Congress are entrepreneurial when it comes to jurisdictional expansion; they have motive to use trial-and-error strategies to claim jurisdictional advantages.
- The Parliamentarian selects among strategies that fit the "weight of the bill" rule, which refers according to jurisdictional proximity and committee expertise.

If these findings are only slightly rephrased, the following picture emerges. Most change in social institutions is through a trial-and-error with selectivity process, resulting in considerable incrementalism and little intended comprehensive change. Once a system adopts a best strategy, from among the rivals it will not move to maximize—its solutions are path dependent. While some solutions are so attractive that all social institutions will converge on them (specialization and division of labor), others are not so uniformly attractive that convergence is so uniform (the House and Senate find different solutions to the bill referral problem). There must exist in evolutionary theory a source of variation (entrepreneurial legislators). There must exist a selection mechanism (the referral system).

The only problem I have with *Turf Wars* is that there is no need to try to distinguish between distributional or informational or party cartel models of committees (although a great deal of good comes from discussing the problem in these terms). Each of these depictions represents something important about Congress—because our national legislature is an adaptive organization facing competing demands. So long as an adaptive, evolving organization faces multiple demands, its solutions, as represented by its committee structure, will

be an evolving compromise—albeit with different salient aspects in different eras (score one for Rhode).

David C. King has written the seminal work on the committee structure in Congress, a book that will be consulted as the standard work for years to come. It should be evident from this review that I think it is far more: *Turf Wars* is a template for the study of formal institutions in a complex society.

The Days of Wine and Roses Are Over. By Daniel C. Kramer. Lanham, MD, and London: University Press of America, 1997. 340p. \$64.50 cloth, \$37.50 paper.

Jeffrey Kraus, *Wagner College*

Kramer offers us a biography of Hugh Carey, a governor who had a significant influence on the direction taken by New York City and state in the last quarter-century, but whose administration was overshadowed by that of his successor, Mario Cuomo. As Kramer notes in the preface, only one other book has been written about the Carey era (1975–83) in the fifteen years since the governor left office.

The book's central thesis is aptly summarized by the title of the final chapter, "A Rolls Royce Engine in a Studebaker Body." As Kramer notes, Carey "did more than anyone else to save the City of New York from bankruptcy in 1975" (p. 316). Yet, this was the same man who responded to concerns about PCB contamination in a state office building by offering to drink the water there. While Kramer concludes that Carey was an outstanding governor, his stewardship was affected by what Gerald Benjamin describes as his "disregard of public image" ("The Carey Governorship," in *Making Experience Count: Managing Modern New York in the Carey Era*, ed. Gerald Benjamin and Norman Hurd, 1985, p. 251) and by Carey's lack of interpersonal skills.

The book begins with a brief discussion of Carey's formative years. We learn of the family troubles during the Great Depression and how those experiences later helped convince the governor that New York City had to remain solvent during its fiscal crisis in the mid-1970s. As a young officer during World War II, Carey helped liberate the Nordausen concentration camp. According to Kramer, this experience "bred in him a loathing of the use of violence and killing to solve political and social problems that has lasted to this day" (p. 7). This may help explain Carey's opposition to the death penalty.

Sixteen chapters then cover Carey's first campaign for governor and various aspects of his administration. Four of these are devoted to the administration's efforts to keep the city and state from insolvency between 1975 and 1978. Much of this material has been examined elsewhere in both the popular and scholarly press (Ken Auletta, *The Streets Were Paved with Gold*, 1979; Robert Bailey, *The Crisis Regime*, 1984; Fred Ferretti, *The Year the Big Apple Went Bust*, 1976; Charles Morris, *The Cost of Good Intentions*, 1980; Martin Shefter, *Political Crisis/Fiscal Crisis*, 1987; and William K. Tabb, *The Long Default*, 1982). Kramer's analysis is distinguished by the significance he places on Carey's years in Congress (1961–75).

Kramer presents the position that Carey was particularly successful in securing federal support for a New York bailout (despite the blaring *Daily News* headline: "Ford to City: Drop Dead") because of his ability to present New York's case in Washington (in testimony before various congressional committees, Carey explained that the city's fiscal crisis was threatening the state's solvency and impairing the efforts of other states to secure money in capital markets). Carey's personal relationship with many members also proved important. As Kramer ex-

plains, "the Governor's activities in the House and Senate did not consist merely of speaking before committees. He made use of his network of friendships in the House among members of both parties, and among conservatives as well as liberals to try to develop a majority in that body for loan insurance" (pp. 69–70). Carey ultimately prevailed, and New York City did emerge from its fiscal crisis.

Various chapters deal with Carey's relationship to the Democratic Party (not very good) and the state legislature (at times even worse); his reelection campaign; and economic development, transportation, environmental, health, and criminal justice policies.

One of the last chapters covers with what Kramer calls Carey's "Long Winter of Discontent" (fall 1980–fall 1981), when "several episodes convinced many New Yorkers that their Governor was a flake" (p. 276). Some of these mistakes were political, such as his support for Bess Myerson for the U.S. Senate in 1980 because he regarded the seat as the "Jewish" seat (p. 276) or his lukewarm support for President Carter's reelection. Other errors were more personal in nature. His attempt to condemn the property of a Shelter Island neighbor for "security reasons" failed but resulted in Carey being savaged in the press. His sudden decision to dye his hair and his marriage to Evangeline Gouletas, about whom there was considerable confusion concerning the number and whereabouts of her previous spouses, brought derision. A chapter on the Governor's management skills and a concluding chapter round out the work.

The book's title comes from Carey's first State of the State Address. After two decades of profligate spending under Nelson Rockefeller, New York would have to live within it means. In view of what would happen in the months and years to come, Carey's words were prescient.

Hugh Carey would be the first chief executive to grapple with the role of government in a time of diminishing resources. In contrast with his Republican predecessors, he proved to be something of a fiscal conservative, presiding over a cut in personal income taxes and slowing the growth rate of state spending. Carey would also play a significant part in changing the state's mental health policy; the practice of "warehousing" the mentally retarded in large congregate facilities ended when Geraldo Rivera exposed abuses at the Willowbrook School. Carey moved the state toward the more humane practice of placing only the most seriously ill in psychiatric centers and locating the overwhelming majority of the state's charges in group residences and other less restrictive environments. Under Carey, New York became the national leader in the deinstitutionalization movement.

Kramer's work benefits from interviews with Carey and more than 125 of his contemporaries. The book sheds a great deal of light on a man obscured by his lieutenant governor and successor, Mario Cuomo.

The President's Call: Executive Leadership from FDR to George Bush. By Judith E. Michaels. Pittsburgh, PA: University of Pittsburgh Press, 1997. 348p. \$50.00 cloth, \$22.95 paper.

FDR and the Modern Presidency: Leadership and Legacy. Edited by Mark J. Rozell and William D. Pederson. Westport, CT: Praeger, 1997. 242p. \$59.95.

M. Stephen Weatherford, *University of California, Santa Barbara*

Among the president's greatest and most inscrutable challenges is shaping the bureaucracy to carry out the administration's goals. Many heads of large organizations face similar

challenges, but the context of public accountability, media coverage, and especially the competition inherent in the separation of powers multiplies the difficulty—and arguably transforms it qualitatively—for the world's most visible leader. These books offer perspectives on presidential control of the bureaucracy from two promising vantages, at the beginning of the modern presidency's growth and at the end of the Reagan-Bush era, which marked the interment of the New Deal belief that activist government could make things better.

FDR and the Modern Presidency brings together papers from a conference held at Louisiana State University, Shreveport, in 1995, on the fiftieth anniversary of Franklin Roosevelt's death. Although the modern presidency did not begin with the New Deal, Roosevelt's task was less to control an established bureaucracy than to develop the government's capacities, its sources of information and levers of implementation. The normative issues were clearer and the opportunities for experimentation freer than for later presidents, and the ideas and arguments—over what the government should be able to do, what sorts of institutions should be constructed, and what qualities of individuals should be recruited—had a clarity and open-endedness that they would never have again.

The authors of the eleven papers are historians and sociologists as well as political scientists. They offer a wide variety of vignettes from the Roosevelt years. Like snapshots chosen randomly from a very large album, most capture some telling little truth that leads one to want to find out more about the characters in the picture and the events that brought them together. For instance, Martin Halpern tells the fascinating story of the meeting, in the depths of the 1938 recession, between FDR and Henry Ford, icons in an explosive national debate in which one side feared that the government was bent on socialism and the other believed that the propertied classes were planning to withdraw finance capital from the economy. William Ellis traces the troubled ambassadorship of Robert Worth Bingham in England, showing that Bingham's internationalism allowed the administration to express positions for which the isolationist American public was not yet ready. And yet, Ellis argues, the relation between FDR and Bingham was much more complex than the conventional view of a president who manipulated subordinates for his own purposes. Allida Black's chapter on Eleanor Roosevelt's efforts—inside the White House and out in the country—to advance the cause of civil rights brings out both the limits to Mrs. Roosevelt's influence and her own ambivalence when it came to applying the same principles to the Japanese internment that she advocated for Negroes in the South.

If these chapters lead toward the wider literature on the people around Franklin Roosevelt, others whet the appetite for more extended expositions of the events and their interpretation. For example, Margaret Rung looks at the way legitimate claims to bureaucratic authority developed as government grew, highlighting the tension between college-based expertise (with its strong class bias in the 1930s) and the promise of upward mobility for long-time civil servants who had worked hard for promotion. By the late 1930s, personnel specialists had developed a body of professional knowledge that helped to transform this "political" debate into an administrative one, first toward technical questions about job classification and then toward issues of human relations and program development. Michael Lewis places the early history of public works during the New Deal into the perspective of state autonomy, arguing that the initial administrative vehicle, the Civil Works Administration, was scuttled within a year of its formation, in essence because of its

success as an autonomous innovation independent of societal groups. The mandate and organization of the successor agency, the WPA, not only was circumscribed by the influence of business interests and state governments but also reflected the delicate balance of forces within the developing profession of social work, between case workers focusing on the needs of individuals and social engineers who saw unemployment as the inefficient use of economic resources. Matthew Dickinson describes FDR's advisory system of "competitive adhocism," arguing that it is vitally relevant to current debates over the administrative presidency, because the system is at heart antithetical to the operation of a "presidential branch" narrowly centered on the White House.

The entries inevitably vary in quality, but the collection as a whole will stimulate students' interest in the Roosevelt years. At the same time, experts on the New Deal will find few of the chapters completely convincing interpretations: Their brief, staccato pace allows little opportunity for nuance, a dangerous failing in writing on the richly storied New Deal.

The President's Call carries forward the story of the administrative presidency, placing a survey of President Bush's Senate-confirmed political appointees (PASs) into the context of postwar presidents' use of the appointment power, and focusing especially on the similarities and differences between those of Bush and Reagan. Although Michaels initially intended to replicate earlier polls of upper-level bureaucrats carried out by the National Academy of Public Administration, the study itself ran into such a flurry of melodramatic perils that it could serve as a cautionary tale for those who suppose that a questionnaire is all one needs to get at the truth. In spite of these problems, the descriptive portrait is of considerable interest, and the historical summary, especially of initiatives under Nixon and Reagan, provides a telling perspective.

Momentum, as candidate Bush found, is an unreliable ally; Michaels ran into similar reversals. She was awarded a doctoral research fellowship at the General Accounting Office, and with the cooperation of NAPA, her project appeared to be well underway. The bureaucracy being a place of many vetoes and no imprimaturs, however, each step needed to be negotiated, and each negotiation cost a few hostages. The GAO was unhappy with NAPA's questions, and modifying them undermined the goal of replication. The White House was skeptical of GAO's intentions and refused to sanction the survey, leaving an atmosphere of suspiciousness even when the list of PASs was finally released. And the list was out of date anyway, making it hard not only to locate all 600 or so current PASs but also to compare the respondents (response rate $\approx$ 38%) to the population. Michaels followed up the mail questionnaire with personal interviews of about three dozen respondents, and this lends additional detail. It is difficult, however, not to be skeptical of the validity and generalizability of the results, and the analysis does little to dispell such concern. Between what appears to have been GAO's principled opposition to anything more revealing than running the marginals, and Michaels's own aversion to moving beyond description, neither validity analysis nor causal hypotheses come in for sustained attention. For instance, the criteria for including or deleting individual respondents are unclear; response categories do not appear to be unbiased samplings of the universe of content, and opinion responses are not anchored in any uniform standard, especially on questions regarding job satisfaction or reasons for leaving government service; and the absence of multivariate analysis invites mistaken attributions of causal influence.

Much can be learned from good description, however, and

this is especially the case with the political stratum of the bureaucracy, which remains an aspect of the American political system about which our understanding is sorely incomplete. Michaels confirms what previous studies (four NAPA reports during the 1980s, the Volcker Commission report in 1989) have revealed: Morale is low among both political appointees and careerists, and the proliferation of political appointees and the increasing emphasis on ideological loyalty have slighted both administrative talent and subject-area expertise. The confirmation process and the budget process continue to be foci of complaint by PASs, and suggestions for reform are constructive and sensitive to the public, political context; these are not simply business leaders bent on transposing private sector hierarchies to public administration. At the same time, there are some notable surprises. In spite of Bush's rhetorical commitment to the ideal of unbiased public service, his appointees did not differ much from those of his predecessor: They were Bush loyalists rather than Reagan loyalists, but their background of government service, organizational experience, or substantive expertise was equally light. At the same time, once PASs gained some experience or substantive expertise was equally light. At the same time, once PASs gained some experience of working with senior civil servants, they evaluated the careerists as skilled and reliable, not at all the political obstructionists they had expected. And in contrast to Heckscher's famous aphorism, after ten years or so of Republican presidents, the bureaucracy was no longer a government of strangers but a coterie of colleagues with similar backgrounds and political beliefs.

The wealth of descriptive data on Bush appointees is placed into perspective by the author's review of the history of attempts to craft an effective administrative presidency. Previous researchers—Nathan, Pfiffner, Aberbach, and Rockman, among others—have told the key episodes of this story, but Michaels interweaves historical developments in light of the dynamic tension between politics and administration, between centralizing control and overloading White House decision making. In the end, the book may not quite measure up to its subtitle, but it amounts to more than a small survey study wrapped in a large box of quotations from previous studies. Indeed, Michaels makes a good case for an unbroken thread of institutional development from Nixon through Reagan and Bush, and scholars who see a secular "thickening" of the medium in which presidential power is exercised will find in this book valuable evidence for various models of presidential cycles and political time.

These two new books on public administration at the highest level of government were published at about the same time as James March's Gaus lecture to the 1997 APSA convention ("Administrative Politics, Organization Theory, and Political Philosophy: Ruminations on the *Reflections* of John M. Gaus," *PS* 30[December 1997]:689–98), and the juxtaposition suggests the context for judging their contribution. At a time when significant new theoretical approaches are contending in the larger discipline, when popular mistrust of government signals the need for political scientists to help deepen our understanding of democratic administration, March urges three "scholarly commitments." On the first, understanding the detailed context of administrative practice, these texts rate high praise. On the other two, linking the study of public administration with organization theory and with democratic political philosophy, they fall lower on the scale. We find little guidance here on questions of how public organizations deal with asymmetric information, adapt to changing environments, or develop networks into decision-making patterns. Nor do the authors grapple with questions

of accountability or legitimacy, the quality of civic discourse, or the refurbishment of social capital—more distant from daily practice to be sure, but issues to which the administration of government is surely vitally relevant.

Consider, for instance, the potential for systematic comparison along the continuum from neutral to responsive competence, where the variation across the presidencies from FDR to Bush is dramatic. How does responsive competence systematically alter the relationship between principals and agents? How does it change the conditions for successful organizational learning or adaptation? What light can now be shed on the trade-off between responsiveness to the cycle of presidential elections and the role of bureaucracies to ease the difficulty of committing to long-term goals? These questions come from what March calls the “lost tradition” of John Gaus. The research in these two books provides the sort of data needed to confront such questions, but other scholars will have to put the data to use.

Federalism and Environmental Policy: Trust and the Politics of Implementation. By Denise Scheberle. Washington, DC: Georgetown University Press, 1997. 224p. \$58.00 cloth, \$20.95 paper.

Susan J. Buck, *University of North Carolina, Greensboro*

This book is one in a series edited by Barry Rabe and John Tierney, *American Governance and Public Policy*. The series is targeted at both academic and professional audiences, and this volume fits that audience well. It addresses the increasingly important question of implementation design for environmental programs that inextricably link federal mandates, federal oversight, and state agencies. Especially noteworthy is Denise Scheberle's discussion of the perceptions and roles of federal regional officers.

The book explores working relationships between state and federal administrators in five environmental programs. Four are administered by the Environmental Protection Agency (EPA): the state drinking water and wellhead protection programs (authorized under the Safe Drinking Water Act, as amended) and the radon and asbestos programs (authorized under the Toxic Substances Control Act). The fifth is the surface mining program, authorized by 1977 legislation and administered by the Office of Surface Mining Reclamation and Enforcement in the Department of the Interior. The case studies of the five programs are thoroughly researched. Scheberle's descriptions of the enabling legislation and the development of the programs are helpful in setting the political context for ensuing federal-state relationships; her presentation of the surface mining program is particularly good.

Scheberle surveyed state directors for all five programs as well as the appropriate EPA regional officers and OSM field officers. She also conducted telephone interviews with state and federal officials. In the opening chapters, Scheberle presents two analytic models to organize her analyses: a typology of federal-state working relationships based on trust and extent of involvement, and a systems model of extrinsic and intrinsic factors that affect state implementation. The second framework is similar to the well-known implementation model of Daniel Mazmanian and Paul Sabatier (*Implementation and Public Policy*, 1983). It adds factors specific to state implementation, such as role orientations of federal oversight agency personnel and national-level political support, although it is necessarily less detailed than the Mazmanian and Sabatier model. It provides a useful set of guidelines

for discussions in the case study chapters. The first model is more problematic, however.

In the first model, *trust* is defined as the intensity of the belief by one set of officials (state or federal) that their counterparts are dedicated to implementing policy effectively. *Involvement* includes formal and informal communication between the two sets of officials, the frequency and nature of oversight activities, funding, and resource sharing. Scheberle then combines these attributes to describe four types of relationships between state and federal officials. The type characterized by high trust and high involvement, described as “pulling together and synergistic,” is identified as the obviously preferred relationship.

I spent a fair amount of time puzzling over this typology. First, it is not clear to me that *trust* is solely or even predominantly based on one's beliefs about another official's dedication to the task. It is much more likely to be based on one's perception of the likelihood that she will deliver what has been promised, such as funding, technical assistance, or political intervention. The most dedicated person may be unable to follow through on agreements, and an official who is indifferent to policy outcomes may have professional or practical reasons for being utterly reliable. Second, I am not convinced that the most preferred quadrant of this topology is always high trust and high involvement. I can easily envision a program in which the federal and state officials have little direct programmatic involvement with one another but still produce successful state programs; an example that comes to mind is state wildlife management programs funded through the Federal Aid to Wildlife Restoration Act (1937).

The real meat of the book comes in the final two chapters, with the respective discussions of federal regional officers and Scheberle's conclusions. The author correctly notes that the roles and perceptions of federal regional officials have been largely ignored by policy implementation scholars. Scheberle's interesting findings may well spark a new interest in regional and field officers. Bless 'em—they must frequently be miserable, caught between state officials who view them as the primary contact with the national government and its maze of mandates, and the home office, which often delivers new policies like Jove from Olympus but then retains fundamental control of funding. Scheberle's research shows that while regional staff have a lower level of confidence in state program effectiveness than do state officials, they also lack confidence in federal efforts and headquarters staff. For example, only 47% of federal regional staff think that federal implementation efforts have been effective (Table 5-3, p. 172). This dissatisfaction can be even more striking when broken out by programs: Zero percent of federal wellhead protection staff thought the federal program was effective (Table 5-4, p. 173). What might be done to improve these relationships and, presumably, the program effectiveness?

Scheberle suggests that solutions lie in increasing levels of involvement and trust. Involvement might be improved by increasing the frequency and quality of interagency (state, regional, and national) communication. Trust is more difficult to establish, but Scheberle notes that encouraging open dialogue, discouraging sub rosa communication, and focusing on policy outcomes rather than implementation means may be helpful. Unfortunately, such recommendations ignore the bureaucratic imperatives that often control agency personnel regardless of the policy being implemented. I think it is more likely that low levels of trust are a symptom of poor institutional design. Rather than seeking to increase involvement and trust, policymakers might be better served by examining the structures of incentives and disincentives for state agencies with an eye to institutional redesign.

This volume is useful in three significant areas. First, it is a scholarly examination of the important issue of federal-state relationships in environmental policy implementation. Second, the five programs chosen as case studies cover a sufficiently wide range of policy types to allow plausible generalizations about the perceptions of agency personnel at the various levels of government. Third, the discussion of regional federal officials provides a nucleus for future research on a vital area in implementation studies. This book should be of interest to administrators at the state, regional, and national level as well as to scholars concerned with policy implementation processes.

Ambition and Accommodation: How Women View Gender Relations. By Roberta S. Sigel. Chicago: University of Chicago Press, 1996. 240p. \$48.00 cloth, \$16.95 paper.

Linda L. Fowler, *Dartmouth College*

Roberta Sigel examines the consequences of the women's movement for the daily lives and perceptions of women. Changes in gender roles and the rapid movement of women into the work force led Sigel to ask a simple question: How do women perceive their current status in society, and what further actions are they prepared to take to realize their goals of equality? Sigel asked this question in 1985, when she conducted focus groups and opinion surveys with 650 New Jersey women and men, but her recently published analysis of the data seems both fresh and timely.

In the roughly two decades that political scientists have been polling public attitudes regarding women, they have documented changes in stereotypical thinking about women generally, probed differences in the way men and women approach political issues, and examined the propensity of the electorate to support female candidates. To my knowledge, however, no one has systematically looked at the question of discrimination toward women and asked how they feel about it.

The mid-1980s were a particularly interesting period in which to explore these attitudes, because women "no longer accepted the dominant group's conception of themselves" (p. 19); they also were experiencing a backlash orchestrated by newly mobilized religious conservatives. The rich and nuanced picture Sigel constructs from both focus groups and telephone interviews not only is compelling in its own right but also offers insight into public opinion during a key transitional period in American politics.

Using the theory of relative deprivation, Sigel looks first for a sense of grievance and then for signs that women's dissatisfaction with their lot leads to group consciousness and collective action. Her research indicates a high level of awareness on the part of women and men in her study about the "second-class status" of women and a considerable degree of discomfort among members of both sexes over its persistence in American society. Yet, the respondents show little inclination to take political action to remedy the situation.

Women as well as men, Sigel reports, are inclined to blame men rather than society for the unequal treatment they experience, but neither group seems to put much faith in collective challenges to the social order or in governmental intervention. Indeed, women appear to think it is up to them as individuals to rise above whatever biases they encounter, and they also are likely to claim that they have not personally experienced the discrimination they readily acknowledge around them. Men, not surprisingly, reveal less intensity about gender inequality, but they, too, seem to think that

discrimination is the way of the world and appear more indifferent than hostile to political action on behalf of women.

Clearly, Sigel's findings suggest that awareness of inequality is not a sufficient condition for political action. She offers the view that women's participation in intimate relationships with men distinguishes them from other aggrieved groups, such as African Americans, who demonstrate much higher levels of mutual solidarity and obligation. The cost of conflict is so high, she argues, when the oppressor is also a parent, husband, lover, or father of one's children that women choose to devote their energies to pragmatic adaptation rather than challenge perceived injustice through protest or political demands. Similarly, the resistance of men in the private sphere to their perceived loss of dominance conflicts with their embrace in the public sphere of abstract principles of merit and equality. A sizable majority of both women and men, therefore, react to the trend toward greater opportunity for women with acceptance and approval but display considerable ambivalence about the next stage.

That something so deeply political as the women's movement in the 1980s should elicit so little in the way of an agenda for collective action is stunning. But Sigel is handicapped in fully exploring this seeming paradox by her decision to rely so heavily on focus group data as a source of evidence—which is relatively common now but was unusual at the time of the study's initiation. The interweaving of the two makes the book accessible to a wider audience than might otherwise be the case, but it does limit the scope of the analysis. By the time Sigel lays out her observations of the groups and presents the frequency distributions of the key survey items, she has little room left to model the statistical relationships among the variables. Given the fascinating array of attitudes she has uncovered, the reader is eager to obtain a clearer picture of how the various pieces fit together.

It is difficult to generalize from analysis of a single state. In some states the population probably would have been less supportive of women's equality than was the case in New Jersey, and in others women may have been more receptive to political mobilization. Yet, Sigel's study vividly demonstrates why political entrepreneurs are so critical in American politics in setting the national agenda. Transforming a *condition*, which one accepts as an unpleasant fact of life, into a *problem*, which one endeavors to correct, is the work of party activists and interest group advocates. Left to their own devices, women and men are inclined to make do and muddle along, regardless of their education and occupation. What Sigel documents so thoroughly is not a rational calculation among citizens to play the free rider but an absence of political imagination.

The Farrakhan Phenomenon: Race, Reaction, and the Paranoid Style in American Politics. By Robert Singh. Washington, DC: Georgetown University Press, 1997. 352p. \$60.00 cloth, \$17.95 paper.

Richard A. Keiser, *Carleton College*

Robert Singh has written a peculiar book. It makes lengthy and determined, but flawed, arguments for two theses for much of its first four chapters; then, the final two substantive chapters convincingly refute these two theses. The central question is how a man like Louis Farrakhan has risen to prominence and leadership in black America. Put another way, what factors transformed the leader of an obscure religious group, the Nation of Islam, into one of the most widely recognized and powerful black leaders in the country?

Singh's first thesis is that media coverage did it. In a chapter entitled "From the Margins to the Mainstream: The Rise of Louis Farrakhan," Singh argues that the first step in Farrakhan's rise was the media attention he received during Jesse Jackson's 1984 campaign for the Democratic presidential nomination. Prior to that according to the author, Farrakhan occupied a position of national obscurity and near total anonymity among whites, but after the campaign he was widely recognized across the country. Farrakhan's death threats against the black journalist who reported on Jackson's "Hymietown" remark and Farrakhan's description of Adolf Hitler as a "wickedly great man" created a national controversy.

Another major step toward national prominence as a black leader, according to Singh, was Farrakhan's invitation in 1993 from the esteemed and mainstream Congressional Black Caucus (CBC) to participate in the panel "Race in America." The event was covered live by C-SPAN and received considerable attention from the news media. Undoubtedly, the coverage and the respect of the CBC helped to elevate Farrakhan's stature in the white community. The final key event was, of course, the Million Man March.

Having established the course of Farrakhan's rise Singh then asks what kind of leader he is. Singh turns to Richard Hofstadter's *The Paranoid Style in American Politics* and argues that Farrakhan demonstrates the six distinctive characteristics of this "mental disorder" (p. 152). The most noteworthy is the perception of an immense conspiracy to destroy an entire cultural way of life or political group. Farrakhan's disorder, according to Singh, emerges from his delusion that a diffuse antiblack conspiracy is responsible for the devastation of many black communities across America.

Two-thirds of the way through the book, scholars familiar with the Nation of Islam (NOI) and schooled in the literature on subnational black politics will be unsatisfied by these arguments. Undoubtedly, the Jackson campaign, the CBC invitation, and the Million Man March did bring Farrakhan onto the radar screen of white Americans and made them see him as a preeminent black leader. But that status is not achieved because of what whites think; rather, it depends on the opinion of blacks. The question that begs for an answer here is why Jackson, the CBC, and the marchers treated Farrakhan not as a marginal, eccentric, and extremist purveyor of bizarre views (as NOI leader Elijah Muhammad and his disciple Louis Farrakhan had long been seen by the vast majority of black Americans) but as a leader with support that went far beyond the NOI membership, and thereby gave the media a spectacle.

Why Jackson asked Farrakhan to join his campaign is not explained; when Farrakhan's anti-Semitism redounds negatively on Jackson, we learn only that "intrablack electoral imperatives" (p. 47) precluded Jackson from denouncing Farrakhan. Similarly, no explanation is offered for the CBC invitation or why the CBC signed an agreement with the NOI that gave it the same consultative role on legislation recently accorded to the venerated NAACP. Jackson had learned from Harold Washington's stunning victory in Chicago in 1983 that the balance was shifting in the black community; black nationalists were gradually gaining the political allegiance of an increasingly frustrated cross-class electorate, whose disillusionment with black elected officials was growing. CBC members—such as John Lewis, Kweisi Mfume, Charles Rangel, John Conyers, and Bill Gray—as well as black mayors like Andrew Young, Maynard Jackson, Tom Bradley, Wilson Goode, and even Harold Washington recognized that if they repudiated and marginalized Farrakhan

they risked losing a large segment of their electoral base, not just a few misguided religious zealots.

Singh sharply shifts his argument in the last third of the book and largely rejects the thesis that media coverage catapulted Farrakhan from obscurity. At the same time, he also undermines the idea that there is something paranoid or delusional about blacks believing that whites have conspired to destroy their communities. Singh cites statistics on household income, percentage of population below the poverty line, unemployment, welfare receipt, and prison incarceration that demonstrate a lack of progress since the 1960s, and he argues that there are empirically rooted reasons for large numbers of poor Blacks agreeing with Farrakhan about a conspiracy while, middle-class blacks are drawn to the fiery leader, according to Singh, because he champions economic individualism and free-market principles. The author seems to conclude that Farrakhan is no more paranoid or deluded about conspiracies than a majority of black Americans, and he has become a prominent leader not because of the media but because his message resonates with the black community.

This book is a good introduction to Louis Farrakhan's public statements and his relationship with the more mainstream black political leadership. Yet, the Nation of Islam is not discussed in the kind of detail available elsewhere (e.g., Claude Andrew Clegg III, *An Original Man*, 1997), and the analysis of Farrakhan does not take us far beyond the insights offered by Adolph Reed ("False Prophet: The Rise of Louis Farrakhan," *The Nation* 252 (1991):51–56, 86–92).

The Rise of Baptist Republicanism. By Oran P. Smith. New York: New York University Press, 1997. 320p. \$38.50.

Mark J. Rozell, *American University*

This study, a revision of the author's doctoral dissertation, is a worthy addition to the rapidly growing literature on religion and politics. Smith traces in detail the move toward fundamentalism and Republicanism among the fifteen million members of the Southern Baptist Convention (SBC) and its implications for the politics of the South and the nation. His very thorough documentation and the breadth of coverage add to the value of the study. This book is a very useful source for scholars researching just about any aspect of the subject, even though there is no deeply theoretical analysis in the end.

Smith covers a great deal of territory. He traces the evolution of the SBC through three conservative eras in this century (1920s, 1950s, 1980s), documents the internal and external events that changed the SBC culturally and politically, examines the SBC's role in the modern "culture wars" through a single-state case study, profiles the membership of the organization, and evaluates the political implications of his findings for the South and nation.

Smith is attempting to make his analysis appeal to a multidisciplinary audience, particularly in the fields of political science, sociology, and religious studies. It is a difficult feat to accomplish to the satisfaction of scholars in all three disciplines, but in fairness the topic requires one to span traditional academic boundaries and try to find some synthesis. Smith is telling the story not only of the transformation of the SBC but also of the South and the Republican Party—and the intersections among them. The book largely succeeds in finding the right balance while not reducing the coverage in any one area to a superficial level. That may be the book's strongest achievement.

In brief, Smith makes it clear that the growing conservatism of the SBC leadership and the rise of the increasingly Republican South are deeply connected, a linkage that

perhaps had not received ample attention from other writers at the time this book was published. He portrays a certain discomfort among many SBC members and, not surprisingly, former members with SBC leadership policies ranging from promotion of GOP activism to boycott of the Disney Corporation. Although Smith counsels against the organization moving too far to the right, it is difficult to escape the conclusion that the SBC became an increasingly powerful political and cultural force once it adopted a more militant and activist posture.

At times Smith writes as though the old solid Democratic South already has become the solid Republican South. Given continued but admittedly weakened Democratic control of most southern legislatures, I am tempted to say "not so fast." But electoral trends may validate his characterization in the near future. In Smith's coverage of southern politics and religion, there is a heavy emphasis on his home state of South Carolina (including an entire chapter), which has the benefit of offering a more detailed case analysis, but it is a little disappointing that the author did not make use of some other state-specific works to provide both validity for and telling contrasts to his own findings.

Such a well-researched study begs for a somewhat deeper theoretical analysis than Smith provides. He offers, for example, a list of advice for the political survival of Baptist Republicanism—also applicable to the GOP—and much of what he says is obvious. Essentially: avoid extremism and harsh rhetoric, be wary of alliances with theological/political strangers, show that movement activism brings about real achievement, and so forth. None of this is arguable, but political scientists will wish for more analysis steeped in disciplinary theory.

These problems aside, Smith has written a richly detailed, valuable study that clearly deserves a place on the shelves of scholars of southern politics and of religion and politics. The writing style is ongoing, although there is a bit too much of the thesis-style sign-posting that usually does not end up in academic books. Smith documents his work meticulously: in fact, the appendices, notes, bibliography, and index total more than 100 pages, about one-third of the book, perhaps a little too much of a good thing. He nicely illustrates findings throughout with helpful figures and tables. The type size in several tables is so absurdly small that the publisher should either enlarge them in any future printings or offer buyers a magnifying glass.

America in Black and White: One Nation, Indivisible. By Stephan Thernstrom and Abigail Thernstrom. New York: Simon & Schuster, 1997. 704p. \$32.50.

Edith J. Barrett, *University of Texas at Arlington*

Much of the scholarly literature on race and race relations over the past thirty years has examined the successes and failures of the civil rights movement, the Civil Rights Act of 1965, and subsequent antidiscrimination and affirmative action legislation. Some authors have been critical of these developments, but much of the criticism has been tempered by the acceptance that some type of social policy is necessary to remedy past discrimination. In recent years the shape of the discussions has taken a different turn. Many Americans—both the intellectual elite and nonelite—are vocally turning against affirmative action, evidenced most recently by the passage of California's Proposition 209. *America in Black and White* is a polemic against all race-conscious social policy, made by two well-credentialed authors, one a professor of history at Harvard University, the other a senior fellow at the Manhattan Institute and an award-winning writer on race

relations. In more than 500 pages of historical details, Stephen and Abigail Thernstrom outline why they believe America must turn away from race-targeted social policy.

According to the Thernstroms—and undoubtedly nearly everyone, black or white, agrees—race relations (read: black-white relations) in America have come a long way since Gunnar Myrdal wrote his infamous work in the 1940s. No longer must blacks drink from separate water fountains, sit at the back of the bus, or bow their heads in subservience to whites who call them by their first name. Blacks are more than three times more likely to graduate from high school now than in 1960; they are five times more likely to attend a four-year college; and they are three times more likely to consider themselves members of the middle class. Life for African Americans has improved immeasurably over the past five decades, and the Thernstroms try to make this very clear. More important to the authors, however, is their belief that racist attitudes among white Americans have diminished. Because racism is no longer a guiding force in the attitudes of whites, and because blacks are now so much better off economically, socially, and politically, the Thernstroms argue, the time for race-based public policy—if ever there was one—is no longer. The authors hold earnestly to the belief that white and black Americans can live together as a single nation, but until race is removed from our policy lexicon, it cannot happen.

America in Black and White provides a comprehensive history of racism in America from the Jim Crow South of the 1940s to the crime-ridden urban ghettos of the 1990s. The book is divided into three parts. Part I provides a history of racism in the South, offering a detailed summary of black life under Jim Crow; the changes brought about by Roosevelt's federal policies; the strides made in integration by the military during World War II; the strength and patience of civil rights activists and of Martin Luther King, Jr., in particular; and finally, according to the authors, the unraveling of the civil rights movement, epitomized by urban riots, the Black Panthers, and the separatist Nation of Islam. The purpose of this first section is to show how much has changed for African Americans and, according to the authors, how quickly it all came about. Furthermore, through their historical account, the Thernstroms wish to make clear that in only two decades many white Americans came to comprehend the backwardness of racism, and with that realization, their attitudes changed dramatically.

Part II is a summary of statistics on the economic, social, and political well-being of blacks today and in the past. The chapters present imposing evidence of the improvements that have come to African Americans. The Thernstroms contend, as well, that the significance of race has declined dramatically in much of American life. They show evidence that education and whether or not there is a male present in the household matters more than race in determining household income. White and black criminals face the same justice system, they maintain; sentences tend to be more severe for blacks because they commit more serious crimes. Black political candidates need not worry about running only in majority-minority districts, the Thernstroms contend, because minority candidates can now win in majority-white districts. While this optimistic view of race relations emerges from seemingly compelling statistical evidence, one is reminded of the duplicity of statistics. Education and marital status do explain income, but what does that tell us, when it is also true that blacks achieve lower educational attainment and are much more likely than whites to live in female-headed households? Does race still not matter? Part II is useful for the data it offers; few other single books provide so much information. The Thernstroms offer their interpretation of the statistics,

but, fortunately, readers are given enough information to be able to draw their own explanation.

Part III, the crux of the book, outlines the role of social and political institutions in shaping black America today. Three chapters are devoted to education, including past and current school desegregation policies, the use of performance testing for students and teachers, and affirmative action admissions in colleges and universities. One chapter focuses on affirmative action in the workplace and another on voting rights and gerrymandering of electoral districts. The final chapter examines the attitudes of whites and blacks toward race. Once again, the book provides useful information, albeit with the authors' particular bent.

Although it does not offer new information to the literature, the book nonetheless provides a thorough review of the historical evidence. On the surface, the Thernstroms seem committed to presenting all evidence, rather than only that which supports their argument. Some times this works, and some times it does not. For example, the authors use the improved rates in high school graduation, college enrollment, income, and unemployment to argue that life is getting better for African Americans. Yet, when they find that the rate of unwed births has been rising more quickly for whites than blacks, they comment that "the rate of change is surely not the most important point" (p. 240). Or, when expressing their disapproval of affirmative action plans in hiring and promotion, they want us to believe that the U.S. Supreme Court had no justification whatsoever for its rulings in favor of hiring blacks or women; at least in the case of *Johnson v. Transportation Agency, Santa Clara County*, there was "absolutely no evidence of past discrimination" (p. 435). While an argument that the Court moved in the wrong direction from a legal, moral, or even political standpoint could be convincing, to ask the reader to accept that the nine judges were grossly negligent in their decisions, seeing discrimination when none existed, stretches the credibility of the point. To their credit, the Thernstroms do not hide their political bent.

If there is one piece truly missing from this book, however, it is insight on what comes next. If America were to abandon completely affirmative action and other race-guided policies, as the Thernstroms recommend, how will black America fare? The authors make it sound so easy. Get rid of color in our policy, and it will no longer exist in our society. If the first post-*Hopwood* class at the University of Texas Law School, virtually devoid of minority students, is any indication, American will be taking a giant step away from racial equality. The authors of *America in Black and White* offer a well-argued prescription for addressing America's racial tensions, but they neglect to mention the potential side-effects of their remedy.

No doubt the debates for and against race-conscious policies will continue in the months and years to come, and no doubt the evidence presented by the Thernstroms will be cited in the discussions. For this reason, any serious scholars of race will want to read *America in Black and White*. As America seeks the best direction for social policy, it is imperative that we examine all points of view and consider all options. We cannot afford to be one-sided, and for this reason the Thernstroms have provided a valuable book. Clearly, *America in Black and White* is written for a nonacademic market; the evidence presented is neither new nor rigorously analyzed. Yet, for its purpose, which is presumably to enter the debate on the next direction of race-based policies, the book has its merits. Given the current controversial state of the political discussion, there is plenty of room for new views. While many readers will not agree with the Thernstroms, they will nonetheless finish the book with a sounder sense of a popular take on affirmative action.

The Politics of Social Welfare: The Collapse of the Center and the Rise of the Right. By Alex Waddan. Cheltenham, UK, and Brookfield, MA: Edward Elgar, 1997. 204p. \$70.00.

Stathis N. Kalyvas, *New York University*

How did the Right win the battle of ideas surrounding the welfare state? How did liberals allow the debate to shift from social justice and poverty to dependency? In other words, how did important parts of New Right ideology permeate the liberal consciousness and become established parts of the conventional wisdom? This book discusses the rise and crisis of the welfare state in the United States and offers an argument explaining the ideological defeat of pro-welfare liberals by the Right. It provides a detailed overview of welfare state-building, beginning with President Johnson's War on Poverty (particularly the Economic Opportunity Act) and including numerous defeated initiatives, such as President Nixon's negative income tax and family assistance plan, and President Carter's Program for Better Jobs and Income. The book's twin focus is on social policy and the ideological context in which it is conceived and implemented.

Waddan is particularly keen on explaining "the open and agonizing nature of the collapse of faith in the capacity of social welfare liberalism to provide solutions" (p. 46). The central argument is that the way in which the welfare state was built in the 1960s undermined its future: the model underpinning it was not viable in the long term; whatever its merits, it could not last. Overly optimistic and naive liberal reformers defined poverty in a self-defeating way conducive to political and ideological confusion. Overall expectations surrounding the War on Poverty were unrealistic. A philosophical ambiguity and an ad hoc nature seemed to permeate the whole effort. The demise of the welfare state was inherent from the very beginning and in its very core. Even when the ideas enjoyed a political hegemony, Waddan argues, there was little consideration of the long-term implications of welfare policies. While governments engaged in the correction of identifiable social wrongs, there was either an unwillingness or an inability to think through the possible implications of each incremental measure, an absence of reflection about the societal costs imposed by welfare policies, and a reluctance to assume these costs and implement adequate reforms.

An example of how the unrealistic expectations of liberal reformers hurt their long-term goals is the way in which they sabotaged the Nixon-era reforms, particularly the family assistance plan, thus missing an opportunity to fortify a philosophy committing government to help the poor under virtually any circumstances. Welfare measures slugged along in a haphazard way: No real integrated structure was created, while the continued expansion of welfare rolls was not followed by a rationalization of the system. The fragmented nature of the welfare structure, particularly its residual-type elements, made it an easy target for opponents. As a result, when welfare policies met with the fiscal pressures stemming from the economic dislocations of the 1970s, particularly the recession of 1979–80, they were promptly defeated on the ideological front. It was an easy task for the New Right to connect the issue of taxation with the notion of the undeserving poor, turn poverty into dependency on welfare, and drive home its point that welfare programs undermined both the health of the overall economy and the dignity of the individual.

Although this is an interesting and plausible argument, it is just that: an argument. No competing explanations are offered, no alternative hypotheses examined. Indeed,

Waddan readily acknowledges that his book is "essentially a commentary" on the crisis of the welfare state in the United States (p. 9). He does not make any particular effort to convince the reader why his argument is more valid than others that have been (or can be) advanced to explain the same phenomenon. Moreover, even the causal mechanisms underpinning his argument are never specified; they are vague and shifting. A comparative framework could have helped in this respect. (In fact, the book's title is misleading; its subject is the politics of social welfare in the United States.) Although Waddan claims that the American case is a valuable guide to the problems encountered by the European welfare states, he takes a stand in favor of U.S. exceptionalism: "Clearly developments in the US cannot be divorced from the country's particularly idiosyncratic historical approach to social welfare issues; and obviously this tradition helps to explain why American liberalism has suffered such a spectacular and painful crisis of confidence" (p. 3).

Waddan then points out (p. 172), however, that the "relatively weak collectivist traditions" of the United States do "not fully explain quite why liberal advocates were so badly beaten." This vagueness underlines the absence of a rigorous specification of the central hypothesis. A related but more serious problem is the absence of theory from the analysis. Even though Waddan refers to welfare state theories (such as Offe's and Esping-Andersen's) at the beginning and end of the book, he makes no systematic attempt to connect his argument to these. On a more general level, while he makes several implicit assumptions about the role of ideas in the success or failure of social policies, there is no explicit theoretical discussion of either the role of ideas in policy-making or the interaction among ideas, interests, and structures; Waddan seems to ignore the thriving relevant debates.

The absence of original data, a research design, and a theoretical framework turns this book into a purely descriptive account of the politics of social welfare in the United States. It is certainly possible to argue that descriptive works do not require a full-fledged research design and theoretical framework but the presence of many implicit and explicit causal claims in the analysis interferes with the description. Although this book could serve as both a factual reference and a commentary on welfare politics in the United States, it is hardly the only one in the market. After all, the author himself suggests (p. 29) a book which, he claims, provides a lengthier and more comprehensive account than his of interpretations about the origins and long-term development of the welfare state.

"We Ain't What We Was": Civil Rights in the New South. By Frederick M. Wirt. Durham, NC: Duke University Press, 1997. 286p. \$49.95 cloth, \$16.95 paper.

Richard L. Engstrom, *University of New Orleans*

In 1970 Frederick Wirt published *The Politics of Southern Equality*, a case study of the initial effect of civil rights laws on Panola County, Mississippi. In 1989 he returned there to begin examining the effect roughly 25 years later. The results are reported in *"We Ain't What We Was."*

Panola County is a small black-belt county in northwestern Mississippi. It had a population of just under 30,000 in 1990, 48% of which was African American. Its economy has evolved from primarily agriculture to small industries. The black population remains very poor, however, with 46% classified as below the poverty line, compared to only 13% of the whites.

The title of Wirt's volume is taken from a saying among the county's African American residents: "We ain't what we

should be, and we ain't what we can be, but by God, we ain't what we was!" Improvements in the political, educational, and economic opportunities of African Americans since Wirt's first study are documented. Changes in federal civil rights laws are identified, not surprisingly, as having been necessary for these improvements to have occurred. But the changes to which Wirt devotes most of his attention are in the attitudes and behavior of the county's whites. It is their reactions to the changes induced by civil rights laws that is the focus of this volume.

Wirt describes his method as "primarily qualitative, with a heavy lashing of quantitative data and measures" (p. 6). He relies on more than 100 interviews with "key actors" in the political, educational, and/or economic life of the county (p. 264). These are supplemented by a content analysis of two weekly newspapers in selected years and a survey administered in 1990 or 1991 (both dates are provided) to around 1,200 students, public and private, in the 6th, 9th, and 12th grades.

The general conclusion that Wirt reaches, based almost exclusively on the interviews, is that the white residents have retreated from the "bitter recalcitrance" he found pervasive in the 1960s. They now display instead a "pragmatic acceptance" of the changes induced by the civil rights legislation. This pragmatism is attributed to an understanding that the cost of noncompliance with these laws now clearly exceeds the benefits. Whites in Panola County still do not endorse the objectives behind these laws.

The analysis concentrates on the county's politics, education system, and economic development activities. The latter two dimensions are covered best. Wirt identifies the effect that two distinct cultures in the county, the Delta culture in the north and Hill culture in the south, had on white reactions to school desegregation and economic diversification. Once the "freedom of choice" subterfuge was disallowed, the whites in the southern part of the county kept their children in public schools and supported integrated education. Those in the northern part chose the private academy option for their children and opposed additional funding for the financially strapped public system. Whites in southern Panola County were also quicker to recognize that good race relations were important to attracting the businesses that would provide economic growth and diversification, resulting in more economic gains in that part of the county.

The analysis is weaker with respect to changes in county politics. As a result of the protections provided by the Voting Rights Act, majority black districts were created for county and municipal legislative bodies, and African Americans were subsequently elected in these districts. The consequences are not examined with nearly the detail one would expect in a single-county case study. For example, changes in public employment and service delivery are noted, but not very systematically and almost exclusively at the municipal level. The county government receives very little attention in this respect, an especially curious omission given that the county is identified as the more important and powerful level of government.

Political change in the county is said to be highlighted by the election of an African American, Leonard Morris, to the state legislature in 1992. While his district has a black majority and is dominated by most of Panola County, it is not as heavily black as those from which African Americans previously had been elected. (Wirt never provides the actual racial composition of the district, but other sources place it at 54% black in total population and 51% in black population of voting age.) This election receives special attention because Morris, according to Wirt, received an astonishing (by county standards) "40.8 percent of the white vote" (p. 81, emphasis in

original), which Wirt for some reason repeatedly identifies as a "plurality" of the white vote, despite only one opponent for Morris. This crossover figure, it turns out, is based on the vote cast in the five precincts identified by "local knowledgeable" as white. No other basis for this designation is reported, however. No figures are provided, for example, as to the relative presence of blacks and whites in these precincts. The designations are said to be "confirmed," however, because Morris failed to carry these precincts, unlike those designated as black. The 40.8% figure is simply the median percentage of votes received by Morris among these five precincts. This is hardly a valid basis for providing, let alone emphasizing, a specific point estimate of crossover voting. Far more information about the precincts on which the estimate is based could be given in a case study such as this, especially for an election so critical to the author's argument.

There is little doubt that great racial change has come to Panola County, as Wirt documents. But he also stresses that the change has been limited to that induced by law. When it comes to aspects of life that the law does not reach, such as friendships and religious worship, Wirt tells us that the county remains divided by color. Indeed, the church repeatedly serves as Wirt's "counterexample" to the other changes brought by the law. Segregation apparently remains most intense in Panola County, as in most of this country, on Sunday morning.

Latino Politics in California. Edited by Aníbal Yáñez-Chávez. San Diego: Center for U.S.-Mexican Studies, University of California, San Diego, 1996. 142p. \$12.95.

Christine Marie Sierra, *University of New Mexico*

The Latino presence in California is formidable and growing. Numbering more than 10 million, Latinos make up nearly one-third of the state's population. Demographers estimate that Latinos will account for almost half of California's residents by 2040. To be sure, the Latino presence in California is not new but embedded in the very origins of the state (and territory) itself. The importance of the Mexican-origin population to California's history is multifaceted. Yet, it is in large part the burgeoning numbers of Latinos—still predominantly Mexican in origin—that have drawn increased attention toward Latinos and their role in Californian society.

A scholarly assessment of Latino politics in California is both important and timely. The Center for U.S.-Mexican Studies has produced a volume of essays that attempts such an assessment. Aníbal Yáñez-Chávez, a professor of geography, brings together an interdisciplinary array of scholars to address important aspects of Latino political participation. Although the focus is on California, important theoretical and empirical observations relate to Latino politics at the national level as well.

As the volume makes clear, the politics of numbers does not translate easily into the politics of power for Latinos in California. Voting potential is decidedly diminished by the large number of noncitizens—estimated at 54% of Latino adults in California. Moreover, such socioeconomic characteristics as youthfulness and relatively lower levels of income and education suppress the Latino propensity to register and vote. Nevertheless, Latinos do participate in electoral politics in California as voters, political party supporters, community activists, and elected officials. Public policy debates in the state, especially in the areas of education and immigration, involve Latino group interests directly. The contributions to this volume address such topics, albeit with varying degrees of success.

Rodolfo O. de la Garza takes to task two prevalent

"myths" that dominate public discourse on Latino voting: (1) Dramatic increases in the Latino population will necessarily affect the political system in significant ways, and (2) Latinos can and will leverage their potential as a "swing vote" in critical elections in order to command more attention from political elites and political parties. Drawing primarily from previously published reports and scholarship, de la Garza identifies constraints on Latino political influence in national and state politics to counter the first myth. He draws attention to the increasing heterogeneity of the Latino population, for example, with regard to nativity, citizenship status, and ethnic identification, to show how increasing numbers—and diversification—may undercut Latino political power. At the same time he underscores how, as loyal partisans rather than switchers or swingers, Latino voters and activists are more likely to wield influence within their respective parties.

Focusing specifically on California, Carole J. Uhlaner synthesizes a number of studies to provide an overview of Latino political participation and party and issue preferences. Although Uhlaner taps data sources that are familiar to students of race and ethnic politics, namely, the 1984 Caltech study of ethnic minorities in California and the 1989 Latino National Political Survey (LNPS), she draws some new comparisons from both studies that offer a fresh look at these data. In addition, she presents results from an October 1994 poll to discuss Californians' preferences on Proposition 187, the statewide initiative denying public services, public health care, and public education to undocumented immigrants. The latter discussion is particularly revealing of how ethnicity, citizenship status, and political mobilization figure into highly contested debates regarding immigrants.

A third essay, by demographer Leo F. Estrada, is a rather weak complement to the contributions by de la Garza and Uhlaner. Although Estrada extends the discussion of demographic limitations to San Diego County's Latino population, his essay lacks breadth and depth, contributing primarily basic data tables drawn from Census and *Current Survey of Population* reports.

The final chapters of the volume address education and immigration policy, two exceedingly contentious issues in California. Education specialist Patricia Gándara identifies the particularly acute problems in California, where students of Mexican origin are fast becoming the most numerous segment in the state's public schools. She recommends specific policies for their solution, such as bilingual education and school desegregation. Her essay, however, is disappointing and appears somewhat misplaced in this volume. A lengthy review of educational theories on Latino underachievement supersedes further discussion of more relevant topics, such as California's political environment and its effect on Latino education and reform initiatives. Noticeable as well is the omission of work by political scientists, such as Kenneth Meier and Joseph Stewart, dealing with Hispanic education.

Historian David Gutiérrez provides an excellent discussion of Mexican migration to California in the context of the political economy of the Southwest. While theoretically instructive, his essay makes the case for reframing the debate over immigration. Gutiérrez persuasively argues that transnational migration networks, in this case between Mexico and the United States, have "reconfigured" the boundaries of the American political community in ways that require new understanding of the migration experience, community building among newcomers, and the very nature of citizenship itself. He draws out important political implications for policymaking and political organizing that could lessen the demagoguery and divisiveness so characteristic of public debate on immigration and immigrants.

The essays in this volume were originally prepared as papers for a conference held at the Center for U.S.-Mexican Studies. Ironically, San Diego and its surrounding communities do not receive much attention in this book. Indeed, regional analyses of Latino politics within California would have been useful. At the same time, the center has produced a volume that is useful for public education and university and college courses. But because of its rather introductory nature, *Latino Politics in California* may be of limited use to scholars in the field.

Interestingly, the editor faults the volume's conventional emphasis on electoral politics (especially voting behavior) to account for Latino politics in California. Although more on Latinos in electoral politics could have been included (e.g., as candidates for political office and as public officials), the point is well taken. Additional arenas and expressions of contested politics in California that involve Latinos—from the elite to the community level—warrant further and fuller investigation. *Latino Politics in California* is just a start.

Comparative Politics

Determinants of Economic Growth: A Cross-Country Empirical Study. By Robert J. Barro. Cambridge, MA: MIT Press, 1997. 145p. \$22.50.

Robert W. Jackman, *University of California, Davis*

The study of economic growth has enjoyed a considerable resurgence over the past decade, inspired in good measure by Robert Barro's empirical work. This brief volume contains three essays that originated as the 1995-96 Lionel Robbins Memorial Lectures at the London School of Economics. Together, the essays constitute an excellent and accessible synthesis of recent empirical research on growth.

The first essay, "Economic Growth and Convergence," begins with a nice discussion of neoclassical and endogenous growth theories. As Barro points out, original neoclassical arguments imply that there are ceilings on growth, absent continuing technological innovations, but the evidence suggests otherwise. At the same time, more recent endogenous growth approaches fail to incorporate typically observed patterns of conditional convergence; that is, other things equal, the poorest economies grow most rapidly. Barro develops an empirical framework that corrects for these two lacunae.

Drawing on estimates for a panel of approximately 100 countries from 1965 to 1990, Barro reports strong evidence for conditional convergence. Among other things, he shows that growth is fostered by higher initial schooling and life expectancy, lower fertility and government consumption, better maintenance of the rule of law, lower inflation, and gains in the terms of trade. At given levels of such variables, growth is a negative function of the initial level of per capita GDP, as conditional convergence would lead us to expect. Barro concludes the first essay with growth projections for 1996-2000. The average overall projection is for an annual growth rate of 2.4%, while regional average growth forecasts range from 0.5% for sub-Saharan Africa to 3.7% for Asia. Remarkably, this verisimilitude is achieved without invoking "Confucian" or any other norms!

The second essay centers on connections between economic development and democracy. Barro finds evidence of a weak, nonlinear democracy effect on growth. Expanding political rights where they had previously been absent fosters growth. Given an intermediate level of democracy, however, further expansion inhibits growth. The pattern is modest at most.

Perhaps of more interest to political scientists, given recent debates, Barro finds strong evidence that prosperity enhances democracy, a relationship he labels the "Lipset hypothesis" after Seymour Lipset's influential paper that appeared in this *Review* (1959). Even in a panel regression framework that includes a lagged measure of democracy (five years), democratic performance is enhanced by per capita GDP, life

expectancy, and a smaller gap between male and female schooling. In other words, economic development affects both levels of democracy and rates of democratization. The essay concludes with an analysis of actual and projected long-run values of democracy, by country, for 1975 and 1994. The comparisons are especially informative in view of the third wave of democratization.

The final essay examines the effects of inflation on growth. Again, this issue has received a good deal of attention and has clear policy relevance, but much of the evidence adduced to date has been inconclusive. Barro finds strong evidence that high inflation does inhibit growth. He further shows that the adverse effect is pronounced. Indeed, high inflation has dramatic consequences over longer periods (say, 20-30 years) on the standard of living.

The crispness of these essays does not come at the expense of methodological rigor. Barro deftly addresses problems of estimation throughout, and his treatment of potential endogeneity problems is especially noteworthy. In this respect, his analyses also serve as a useful methodological corrective to many recent efforts to advance our knowledge of the sources of economic growth.

In all, this small book packs a big punch. To be sure, it does not contain all the detail that one would find in a full-blown text (such as *Economic Growth*, 1995, which Barro wrote with Xavier Sala-i-Martin). But that is not Barro's purpose. *Determinants of Economic Growth* is instead intended as an accessible synopsis of the considerable recent body of empirical work on growth. The book succeeds admirably in achieving this goal. Indeed, it has an unusually high signal-to-noise ratio. And those who may be inclined to the view that economists are insensitive to the *politics* of growth will also be pleasantly surprised.

This is must reading for social scientists interested in understanding patterns of economic growth and in learning about recent contributions to the field. Barro lays out a clear and well-defended position, and his analysis has many implications for those with research and teaching interests in the area. I also recommend his book highly to those looking for an example of an informative and effective approach to data analysis that addresses a central policy issue.

Voting and Political Attitudes in Denmark: A Study of the 1994 Election. By Ole Borre and Jørgen Goul Andersen. Aarhus: Aarhus University Press and Oakville, CT: David Brown, 1997. 352p. \$33.00.

Peter Nannestad, *Aarhus University*

Outside the ranks of country specialists, knowledge of voting behavior in Denmark is most likely quite limited. Possible exceptions are the "landslide" election of 1973, when the

electorate suddenly turned the Danish party system upside down, and the referendum on the Treaty of Maastricht in 1992, when a majority voted against the treaty in defiance of the endorsement of all major parties. The book by Borre and Andersen—both leading scholars in the field of Danish electoral behavior—can be viewed as a first attempt to redress this situation.

The book takes its point of departure in the Danish general election of 1994, which was covered by a very extensive survey, but its principal aim is not just to explain the outcome. Through systematic comparisons with survey data from earlier general elections (generally reaching back to 1971), dynamic aspects of Danish voting behavior during the last two decades are highlighted throughout the study. Furthermore, some of the topics covered in the second half of the book, such as legitimacy of the welfare state (chap. 8) or mass attitudes toward unemployment policies (chap. 9), go beyond the confines of electoral studies in a narrow sense, in that they are not treated in relation to electoral choices.

Through eleven chapters the authors draw a richly faceted picture of Danish voters and their political environment. In doing so they present a wealth of detailed analyses, and they test a broad selection of theoretical propositions on their Danish data, especially in the first half of the book. Examples include theses about the demise of parties (chap. 1), the decline of class voting (chap. 5), “old politics”/“new politics” (chap. 2), proximity versus directional models of voting (chap. 3), and economic voting (chap. 4). The basic result is that “Danish voting behavior can be understood as plausible (if not always wise) responses to actual and proposed policies, to outcomes and to political events” (p. 16). In that sense the Danish system can be characterized as a bottom-up democracy. But the book also pinpoints the possible weakness of such a system. Generally, the voters display a rather limited understanding of the world around them. Therefore, external shocks to the system can easily lead to destabilizing conflicts between the electorate and the political elite.

Comprehensiveness is undoubtedly one of the main qualities of the book. It contains a wealth of information and results on different aspects of voting behavior and political attitudes. This quality comes at a price, however.

In the first place, the authors at times seem to push their analyses to the limits of what the data can support, or even beyond. This is particularly obvious in chapter 4, in which an attempt is made to explain support for government and opposition parties based on their competence ratings in various policy areas. The analysis is marred by simultaneity problems, and hence the estimated coefficients from the OLS regressions reported are most probably both biased and inconsistent. Consequently, some of the conclusions drawn—for instance, that concerns for personal economic well-being and for the macroeconomic situation of the country affect the vote equally (p. 112)—ought to be interpreted with greater caution. Furthermore, some causal models in chapter 5, on the effect of changing class cleavages on the vote (p. 145), most probably also suffer for the same reason. In some instances, more advanced econometric techniques might have remedied some of the problems, but the crux of the matter is that sometimes the authors want their cross-sectional data to provide answers to questions that require longitudinal observations. This was pointed out by Kramer as early as 1983 in the case of economic voting (Gerald G. Kramer, “The Ecological Fallacy Revisited: Aggregate- versus Individual-level Findings on Economics and Elections, and Sociotropic Voting,” *American Political Science Review* 77[1983]:92–111).

In the second place, the theoretical framework of the book

is not very precise. The authors profess to work from the “policy voting model,” which assumes that “Danish voters indeed have opinions corresponding to policy positions in a number of policy areas, and that these positions are consistently related to their evaluation and choice of parties and alternative governments” (p. 12). In order to offset this model from “formal public choice theories prescribing what the voter should do [sic],” it is labeled “semi-rational or value-rational” (p. 12). But throughout the book different theoretical perspectives and concepts are quite liberally applied. Thus, the key concept is party identification in chapter 1 and class membership (in a Marxist sense) in chapter 5. How these concepts and perspectives relate to what is declared to be the basic theoretical perspective of the book is not always obvious. To put it differently: The vagueness inherent in the term “semi-rational” allows a great deal of what looks like ad hoc reasoning. The authors deliberately abstain from formalizing their model. This is certainly advantageous in some respects, but it seems to me that the constraints provided by the need to formalize might have done their theoretical work a lot of good in terms of enforcing clarity and consistency.

Despite these shortcomings (to which may be added the sometimes sloppy language editing and proofreading), the book is a must for anyone remotely interested in Scandinavian politics. To those without such an interest, it will still provide stimulating reading. The Danish Social Science Research Council, which financed the 1994 survey (as well as the previous ones), certainly got value for its money. The recent decision to stop financing this line of research defies understanding.

The Stasi: The East German Intelligence and Security Service, 1917–89. By David Childs and Richard Popplewell. New York: New York University Press, 1997. 320p. \$45.00.

Henry Krisch, *University of Connecticut, Storrs*

A central characteristic of modern dictatorships is a “political” (often misleadingly called “secret”) police. The leaders of regimes “revolutionary” in both domestic and international politics see in their transformational rule the justification for a politically deployed coercive agency.

The scholarly literature about these agencies has generally been of two kinds. One is devoted to establishing and elucidating the record of political police activity, and the other offers conjecture about the relationship of such agencies to the larger political system. The Nazi defeat in 1945 resulted in the availability of records and led more to scholarly narratives than to theorizing about the role of such agencies in the state. This situation seems to be repeating itself with the collapse of communism.

The security forces of the (East) German Democratic Republic present an excellent opportunity for scholars both to explain and explore the GDR’s security agencies and to conceptualize their role in the larger political system. Was the GDR’s Ministry for State Security—the infamous Stasi—an essential component of the political system? Was it simply a copy of Soviet practice? Was it perhaps an economic drain and social disorder that helped bring down the regime? Which of its activities were peculiar to the system in which it operated and which (as the foreign espionage chief, Markus Wolf, likes to claim) were operations common to modern states?

A special feature of the East German scene is that the voluminous records of the GDR’s security agencies, as well as those of the party and state, survived the fall of the regime and are now available to scholars. Most writing on the subject

has focused on establishing the record of Stasi activities. Much of this has come from researchers on the staff of the government agency managing the Stasi files (see various reports on particular episodes by Walter Süß) or from personal accounts by Stasi targets. (See, for example, Vera Wollenberger, *Virus der Heuchler*, 1992, or Timothy Garton Ash, *The File*, 1997.) The work by the leading West German expert, Karl Wilhelm Fricke (*MFS Intern*, 1991), appeared too soon to take advantage of later research.

It is in this context that the first full-length English-language study of the Stasi has appeared. David Childs, a leading British writer on German politics, and Richard Popplewell cover the establishment, development, and organization of the security apparatus, its and relationship to the party and state, its close ties to its Soviet counterparts, its foreign as well as domestic activities, and its performance in the final crisis of the regime from 1987 to 1990.

Given the authors' credentials and the availability of documentary sources, it is unfortunate that *The Stasi* is such a disappointing book. Childs and Popplewell rely almost exclusively on secondary and journalistic sources; a single book, von Flocken and Scholz's *Ernst Wollweber* (1994), bears an extraordinary evidential load. There is slight reference to recent journal publications. More strikingly, there is no sign that the authors worked in the SED, GDR, or Stasi archives.

The authors properly present the evidence for the close relationship of Soviet and GDR security forces, but they do not equal the account in Norman Naimark's *The Russians in Germany* (1995). An opening chapter on the historical background from 1917 to 1945 digresses wildly, including any and every use of force by German communists. Indeed, this chapter—a grab bag of facts out of context—is typical of many to follow. Thus, events in the Spanish Civil War are discussed, but the importance of “Spain” for the later GDR is ignored. Many chapters appear to have been “filled” with material whose relevance to the topic is dubious and in any case not established by the authors (and chapters 5 and 6 overlap considerably). Examples include the case of a British MP who spied for the Czechs (pp. 134–5) or the career of Hans Globke. The work of the West German “Gehlen Organization” is presented twice in almost identical words.

More seriously, Childs and Popplewell are careless with accusations unsupported by evidence. Discussing the scandal regarding Bundeswehr commander General Kiesseling, they remark (p. 165), without citing a single source: “Many believed that behind the entire affair was the Stasi.” Accusations that the West German counterintelligence chief Günther Nollau was a Stasi agent are made in the text, but only in the notes does the reader discover that the authors admit to having no evidence for this charge.

Even a flawed book deserves better editing than the publisher has given this one. Thus, Wolfgang Thierse was not formerly “a churchman” (p. 106); Herbert Wehner did not come to the Federal Republic “from the East” (p. 142); Hans Modrow replaced Willi Stoph, not Egon Krenz, as GDR prime minister (p. 191); and the Soviet invasion of Afghanistan was in 1979, not 1980 (p. 107).

The book does present some data about Stasi organization and resources, and the authors are usefully restrained regarding Stasi ties to international terrorism. But the role of the agency in controlling the Berlin Wall and the border is ignored, as is its use (typical for communist regimes) in monitoring the armed forces. Although the story is carried on to early 1990, the role of citizen activists in storming and securing Stasi headquarters is omitted.

Childs and Popplewell review the political struggles involving ministry chiefs and the SED leadership, particularly

under Ulbricht in 1953–1958, but they have nothing systematic to say as to the role of the Stasi as an institutional component of the regime. Finally, they present no coherent hypothesis as to the Stasi role in the collapse of the regime. Why was this seemingly ubiquitous security force so helpless and hapless in 1989? If it was all the fault of party leaders, what does that tell us about the Stasi's place in GDR politics? How was it that the now famous army of “informal collaborators,” the IMs, could not prepare the regime for the exodus of 1989? To such questions this book has no answers.

Women and Power in Parliamentary Democracies: Cabinet Appointments in Western Europe. By Rebecca Howard Davis. Lincoln: University of Nebraska Press, 1997. 137p. \$32.00.

Passages to Power: Legislative Recruitment in Advanced Democracies. Edited by Pippa Norris. Cambridge: Cambridge University Press, 1997. 259p. \$59.95.

Political Recruitment: Gender, Race and Class in the British Parliament. By Pippa Norris and Joni Lovenduski. Cambridge: Cambridge University Press, 1995. 280p. \$19.95.

Wilma Rule, *University of Nevada, Reno*

The times are changing. While the twentieth was a century of women's equal suffrage, the twenty-first promises to be one of equal governance, as these books and other research portend. Women's national legislative recruitment in democracies—with some exceptions—is on the move at the end of this century. In the short term, change is accelerating. What was significant for women's recruitment in parliament in the 1970s and 1980s is surpassed by new variables of import in the 1990s. A case in point is personal preference vote laws and party quotas. The former was part of a party-list proportional representation cluster of favorable electoral system variables, including large magnitude districts, associated with higher proportions of women parliamentarians. This personal vote enabled women to choose women among candidates on the parties' lists. But political party quotas for the nomination of substantial proportions of women to parliament—exemplified by the Green parties' 50–50 policy—is the leading variable explaining greater women's recruitment in the 1990s among long-standing democracies. The United States is atypical, however: Significant recruitment of women in Congress and state legislatures has been stopped cold since 1992, while recruitment of women in the president's cabinet is on the increase. What used to be a few token women in American and European cabinets has now become a significant cluster, heralded by almost all parties except die-hard conservatives.

Davis's book is the pathbreaking benchmark study of women in the cabinets of Europe. How did they get there? Pippa Norris (“Legislative Recruitment,” in *Comparing Democracies: Elections and Voting in Global Perspective*, ed. Lawrence LeDuc, Richard G. Niemi, and Pippa Norris, 1996, 187) informs us of an indispensable fact: 72% of the variance can be explained by the proportion of women elected to parliament (i.e., a correlation of .85). Given that, how does it happen that more women, and individual women, have become at last the chosen ones with the men of their political parties? Pressure from organized women inside and outside the parties and from favorable national leaders—even in the United States—probably explains why there are more women in cabinets. Favorable leaders might be leftists, centrists, or moderate conservatives. But, Davis asks, which? Historically, the record shows that social democratic prime ministers in the Nordic countries were first to appoint more women to the cabinet. Then other parties determined that

promoting women could increase their vote in their proportional representation countries. It was a bonus. Soon other parties joined in; today, for example, half of Austria's four women cabinet members are socialists, and the other two are conservatives, making up 25% of the cabinet in the 1997 governmental coalition.

Davis does not cover this 25-year historical development, and hence the significance of political party orientation for women's cabinet appointments is discounted. This may be a function of her data set, which uses numbers but not proportions of cabinet women from 1968 to 1992 (pp. 62–3; 115, n. 10). Four women cabinet members of the "left" in a ten-member cabinet would have a different significance than four "rightist" women in a twenty-member cabinet. Nevertheless, the future does appear to promise a continuing mix of political orientations among women cabinet members in most European countries, as Davis contends.

Yet, the long-range prognosis for women cabinet members in the United Kingdom and the United States seems different from that of most of Europe. Under former Prime Minister John Major, two women (9%) were in the cabinet, but with Tony Blair the number more than doubled to five (23%); the situation is similar with presidents Bush and Clinton. Recruitment in the United Kingdom and United States swings up and down, with troughs and spikes in a slow jerky upward trend, and it generally depends on which party occupies the top office. By contrast, the Continent generally shows a steady multiparty linear increase.

Davis's analysis is not on the specific country level speculated about above, but on the patterns of nations she classifies as "generalist," such as the United Kingdom, or "specialist," such as the Scandinavian countries. She does not include the United States in her twelve-nation study, but for comparative purposes it could be classified as a hybrid "mixed semipatronage" model, owing to the deep layer of political appointees under each cabinet member. But are these cabinet typologies predictors of the proportions and type of women in the cabinet? Davis points out very well that in European democratic political systems few women (less than one, on average) were cabinet appointees in the past quarter-century. Yet, she writes that in the "specialist" (mostly Scandinavian) countries women hold about 40% of the top portfolios, and they spent fewer years than men in the parties' waiting line before they were allowed to serve as cabinet members.

If only Davis had added electoral systems to her list of predictors! It is likely that she would have found a strong correlation between, on the one hand, the generalist countries and a majority/plurality single-member district election system (and one that behaves like it, namely, the single transferable vote of Ireland) and, on the other, the low proportion of women in parliament and cabinets. This was the case in the United Kingdom until the Labour Party's spectacular surge in May 1997. Yet, the United States remains an outlier. A country with a mixed semipatronage bent, it has a single-member district system, and women make up only 11% of Congress and have one-third representation in Clinton's second-term appointive apex, the cabinet. Clearly, the United States is among the 18% of deviant cases that need further comparative research.

Are cabinet appointments sex-typed? That is, do women have slim portfolios for children and welfare, while men have thicker ones for munitions and international power? One could say that, but it would be only partially accurate. Dozens of men have served as secretaries of welfare, but few women have been secretaries of defense or state. Again, the Nordic countries have led the way in gender diversification in cabinet appointments, as Davis reports. Madeleine Albright and

Janet Reno, the first U.S. women to occupy male gender-typed "inner cabinet" posts, illustrate what women can climb the slippery ladder: Get outstanding educational credentials and experience in a specialized field. Usually, more is better in specialized and mixed-cabinet countries (such as the United States, France, and Germany). At least *completion* of a university degree generally is a requisite for the U.S. cabinet and others. (The reader is referred to case study documentation in Norris's *Passages to Power*.)

The Davis study examined the change in the number of women attending higher education institutions, rather than the proportion completing a degree. This accounts for her counterfactual downplaying of the significance of higher education for cabinet appointees (pp. 32–3). Once in office, however, do women matter? Neither Davis nor Lovenduski and Norris answer that question. It has to be studied. A case in point is what U.S. secretary of state other than Madeleine Albright has denounced a regime, such as the Taliban of Afghanistan, for denying women and girls education, health care, and the opportunity to work?

While Davis is to be commended for opening up a largely unstudied area, Pippa Norris and Joni Lovenduski ask new questions about legislative recruitment and answer in new and provocative ways in three recent books. Although not reviewed here, *Gender and Party Politics* (1993) asked how gender affects party politics and how parties influence women's political representation. This was a first for the study of parties, and it is a top-notch collection of scholarly studies for both students and instructors. *Political Recruitment*, published only two years later, "took the lid off the black box of party nominations," observed R. Darcy at a recent professional meeting. The book is another original achievement, for here we see the inside rules governing each step toward nomination in the two major parties as well as in the minor ones. The Labour Party's recruitment procedures, adopted in 1993, included a "short listing" of only women's names for nomination in certain favorable constituencies (pp. 73–4). This affirmative/positive action resulted four years later in 101 women Labour MPs, which brought female representation to 18% in the House of Commons. The Conservatives, who followed their regular procedures, elected only fourteen women MPs. Norris's edited volume, *Passages to Power*, followed in 1997, and it significantly broadens the scope of political recruitment inquiry.

To place the books by Norris and Lovenduski in perspective, I briefly consider previous theories regarding candidates' induction to political office. Samuel J. Eldersveld (*Political Elites in Modern Society*, 1989) tells us that mid-nineteenth-century theorists discoursed on elite circulation and class-based outputs. A century later, social scientists sought new paradigms to fit political recruitment and policy in the more democratic context. Among these frameworks, as summarized by Moshe Czudnowski ("Political Recruitment," *Handbook of Political Science*, vol. 2, 1975, pp. 170–89), were stages of recruitment (eligibility, nomination, and election), actors (candidates, party selectors, and voters), their characteristics (amateurs, professionals, and motivations), and the context (including political opportunity and culture).

In addition to these dimensions, Norris and Lovenduski have conceptualized recruitment very originally as a political market. Outcome is explained by political party selector demand and candidate supply (*Gender and Politics*, p. 311; cf. *Political Recruitment*, pp. 144, 184, and *Passages to Power*, p. 2). (Davis, in chapter 7, extends Norris's 1993 diagram to include women's cabinet recruitment.) Norris explains in *Passages to Power* (pp. 11–2) that candidate nominations—with certain exceptions—take place within political parties,

which have rules and cultures. These operate within political systems, which set the structure of opportunities. Selector demand is explained by selectors' attitudes regarding qualifications, while candidate supply is dependent upon such "political capital" as financial assets, political connections, and other resources, as well as motivation.

In *Passages*, Norris and Lovenduski draw upon their large, comprehensive, and carefully designed U.K. data set of aspirants, nominees, and selectors analyzed in *Political Recruitment*. They test whether supply-side or demand-side factors are more important for political recruitment (chap. 9, p. 163). They confirm that House of Commons nominees have nonmanual occupations, and about 70% are university graduates; most are male, white, under age forty, devote considerable time to party work, and have substantial financial resources, support networks, political ambition, and drive. Still, when party selectors were asked which factors were important for choosing candidates, the characteristics of young, unmarried, and politically inexperienced emerged as significant in a regression analysis (p. 184). Labour Party selectors prefer males and candidates who spend hours in party work. Since party selectors, the demanders, indicated few preferences and biases, the authors suggest that lack of candidate diversity is due to the fact that only certain applicants come forward. Are we then to blame women, manual workers, the elderly, nonuniversity graduates, and racial minorities for not applying? More significantly, why are they not coming forward?

One highly significant reason in both the United Kingdom and the United States is the lack of "open seats" in elections. These average less than 10% in each country, and it is difficult to dislodge incumbents. Norris and Lovenduski slight these critical factors and their effect on an applicant's calculus of winning nomination (e.g., *Political Recruitment*, pp. 177–8) as well as on the selectors' concern with the applicant's electability. They do find, however, that when women are encouraged to apply for nomination, more are selected. Similarly, Monique Leijenaar and Kees Niemoller ("The Netherlands," in *Passages*, p. 131) discovered that more women are nominated when there are "special policies to strengthen the position of women candidates." Clearly, this should convince most atypical legislative aspirants that in the nomination and election phases of recruitment they would have a reasonable chance of winning.

In conclusion, further theoretical development and careful research is necessary to explain the significant contexts and processes of political recruitment of women and other underrepresented groups to national legislatures and cabinets. Davis and Norris and Lovenduski have started us very well on that quest.

Sovereignty as Responsibility: Conflict Management in Africa. By Francis M. Deng, Sadikiel Kamaro, Terrence Lyons, Donald Rothchild, and I. William Zartman. Washington, DC: Brookings Institution, 1996. 265p. \$42.95 cloth, \$18.95 paper.

John W. Harbeson, *City University of New York*

The argument of this book is succinctly telegraphed by the title: Especially in the context of sub-Saharan Africa, the sovereign state can no longer be treated as an axiomatic, unchallengeable foundation of contemporary world politics. The international community must intervene to secure the realization of basic human rights and the essential dignity of individuals and communities where nation-states cannot or will not assume the responsibility to do so. In essence, the

authors contend, epistemic global human rights, humanitarian, and human dignity communities must, and increasingly do, reside at the apex of a hierarchy of "sovereign" governing entities, from local governments on up through civil society, ethnic communities, and national and regional governments to international agencies. Implicitly, the contributors construct a pyramidal theory of sovereignty, with lower levels of sovereignty presumed to be both capable of resolving conflicts to protect basic human rights and responsible for doing so, unless they demonstrate otherwise. Failure at the more local level is to prompt intervention at wider levels, culminating in interventions by and on behalf of the international community.

While the authors take issue with Austinian positivist jurisprudence, which they suggest underlies the theory that law derives solely from the sovereign state, their argument in effect incorporates positivism as well as normative jurisprudence, for which they regard Lon Fuller as a modern champion. They see the realities of contemporary world politics, particularly in the post-Cold War era, as changing in ways to undermine de facto the unchallengeability of nation-state sovereignty and to make room in practice for more comprehensive, far-reaching implementation of basic human rights via democratic governance, the rule of law, economic justice, and the recognition of all ethnic identities. The authors recognize that the scale and intensity of contemporary conflicts, particularly in Africa, have de facto overwhelmed the capacity of states to resolve them and that the application of conflict management practices grounded normatively in the global realization of basic human rights is the order of the day.

Sovereignty as Responsibility opens up an important and underexamined area of scholarship: the nature, limits, obligations, and capabilities of sovereign governments in a post-Cold War era in which weak, corrupt, or malevolent nation-states may no longer rely on rival superpowers to sustain them as needed partners in their global power struggles. It is a welcome contribution to a still small body of theory and research that seeks truly to globalize the study of international relations. It considers the implications of characteristically overlooked sub-Saharan Africa for theories that, while purporting to be global, in fact take insufficient account of all major world regions. Furthermore, several lines of future scholarly inquiry suggested by the book's thesis merit particular attention.

The first is evolutionary connections in the modern history of international relations between sovereign states as "facts" and sovereignty as normative principle. It would be useful to go into this problem in somewhat more historical depth by looking more carefully at the origins of the state system. The Peace of Westphalia only culminated a long, wrenching, complex era in the evolution of the state system, not to mention its relations to the birth of the modern nation-state itself. More attention should be devoted to theorists of this era who made seminal contributions to both sovereignty as a concept, notably Bodin, and the notion of the sovereign state (e.g., Machiavelli and Hobbes).

The second avenue is toward a theory of contingent sovereignty. The classic theorists just mentioned regarded their subjects in near absolutist terms. Bodin saw sovereignty as unlimited, inalienable, and indivisible. Machiavelli and Hobbes admitted few normative restraints on the sovereign state once it came into existence and imported inconsistencies into their arguments to the extent they perceived possible such limitations. The theory of sovereignty fell into disuse in modern times in part because it became difficult to say where it lay in democracies, notwithstanding its normative residence

with "the people." Particularly in the post-Cold War era, when the limitations on state sovereignty have become an empirical reality in parts of the world like sub-Saharan Africa and dictators like Saddam Hussein have been forced to accept it, how viable is the concept of sovereignty itself? Is it possible to define a concept of contingent sovereignty, implied by the authors, that marries normative and empirical utility? How? What would it look like? How would it be incorporated in international law and contemporary analyses of international relations?

The third line of inquiry is normative-cum-empirical engagement with contemporary theories of international relations. The idea of responsible sovereignty as a norm joined with contingent sovereignty in practice is an arresting and potentially prescient contribution to theories of international relations as well as political theory. What I missed in *Sovereignty as Responsibility*, however, was sufficient attention to the idea of normatively responsible, empirically contingent sovereignty as a basis for addressing the weaknesses as well as building on the strengths of rival contemporary schools of international relations. What would be the contours, insights, and outcomes of a debate by the authors of this idea with, for example, Waltz, Art, and Jervis; Nye and Keohane; Krasner; and Gilpin? And what would the debate look like if a representative or two of recently resurrected democratic peace theory entered the lists, too. The strengths and weaknesses of this book as the foundation of new, creative additions to international relations theory will become clearer if the authors of the next volume on the subject accept this challenge.

Representation from Above: Members of Parliament and Representative Democracy in Sweden. By Peter Esaiasson and Sören Holmberg. Aldershot, United Kingdom: Dartmouth. 1996. 360p. \$67.95.

Jacques Thomassen, *University of Twente, The Netherlands*

Representation from Above is an impressive and important book, based on an equally impressive series of studies on political representation by scholars at the University of Gothenburg in Sweden.

It is well known that after the great success of *The American Voter*, published in 1960, its authors spread out over the world, in particular to Western Europe, to preach the new gospel of electoral research. As a consequence, the influence of the Michigan school on Western European voting studies can hardly be overestimated. What is perhaps less well known is that at the same time Michigan initiated, or helped to initiate, political representation studies in a number of Western European countries, including Great Britain, France, West Germany, Italy, the Netherlands, and Sweden. The source of inspiration was the famous study on political representation by Donald Stokes and Warren Miller. In most countries this was a one-time event. In Sweden, however, it was not. The first Swedish Representation Study was organized by Warren Miller and Bo Särilvik in 1968 and replicated in 1985 and 1988 under the direction of Sören Holmberg, in this book joined by his junior colleague Peter Esaiasson. Each of these studies combined an election study with a survey among the members of the Swedish parliament, the *Riksdag*. The number of questions asked across levels, in particular on issues, is larger than in any other representation study of which I am aware. Also, the analytical possibilities of this design are enhanced by a content analysis of all government bills, party bills, private member bills, oral questions, and floor debates for the period 1985–88. This made it

possible to link the attitudes of members of parliament to their behavior in parliament. Such wealth of data is unparalleled in the world.

But, of course, data do not write good books. It takes good scholarship to do that. It is the combination of a wealth of data and excellent scholarship that makes this such a good book. After a short introductory chapter on "the puzzle of representation," the book is divided in three parts, analyzing how members of parliament act in three different capacities: as representatives, as opinion formers and as decision makers, followed by a concluding chapter on the "not so Responsible Party Model." The analyses throughout the book are guided by two distinctions representation run from above versus representation run from below, and individualist versus collectivist representation. In a nutshell, representation from above refers to a process of opinion formation where the mass public follow the elites, whereas in representation from below the political elites are more responsive and inclined to follow the mood of the public. Which of these two models comes closer to the real world is not easy to assess. The richness of the analytical possibilities of the Swedish series of representation study is best shown when the authors try to answer this fundamental question. It is possible to see not only the differences of opinion between voters and representatives at each separate point in time, but also how these differences have increased or decreased over time and—what is essential here—the dynamics of these changes: top down or bottom up. Cases in which voters and members of parliament have grown closer together can be tested by seeing who have moved most: the voters towards the members of parliament or the members of parliament towards the voters. The conclusion is that in most cases "dynamic representation" means a top down process—voters usually follow the elites.

Equally fascinating is the chapter "Knowing the People." If members of parliament want to follow their voters, or at least are willing to take their voters' opinion into account, they must know where the voters are. Therefore, the authors try to assess to what extent members of parliament are aware of the true opinions of the voters in different policy areas. Not surprisingly this differs from one issue domain to the next. But the most interesting analysis and finding refer to the *explanation* of perceptions and misperceptions of the people's opinions. The authors apply Heider's theory of cognitive balance to politics, i.e., the theory that people want to be in accord with what they like and in discord with what they dislike. They believe their friends think as they do and that their enemies think differently. Politicians appear to be human. They tend to think that their voters have the same opinions as they do. It is not the true opinions of the voters that define MPs' perceptions of where the voters stand, but their own opinion. For the working of perception as a tool in the process of political representation this is a devastating conclusion. What it means is that "information channels between voters and representatives work badly when they ought to work best, and they work best when they need not work at all." When representatives agree with their voters, they will have a correct perception of their voters' position, and a wrong perception when their position deviates from their voters' opinion. But in neither case has it anything to do with real knowledge of where the voters are.

Individualist versus collectivist representation is the second distinction guiding the analysis throughout the book. Individualist models of representation emphasize the dyadic relationship between representatives and their constituents. In this view, which individuals are chosen to represent the voters is decisive. Collectivist representation

models, by contrast, point to parties as the overwhelmingly dominant actors; individual representatives have but an insignificant space in which to maneuver. The distinction between collectivist and individualist models reflects a contrast between European and American perspectives on political representation. European scholars have strongly argued that United States-inspired individualist models are not meaningful in reference to party-dominated parliamentary settings. According to the authors, this distinction is too simple. As much as politics is dominated by party discipline, in Sweden as much as in any other European parliamentary democracy it does make a difference, they argue, which persons on the party lists are actually elected. The analyses make it clear indeed that different members of parliament champion different interests, and different MPs championing different interests exploit different parliamentary channels. As it turns out, myriad interests and loyalties meet and sometimes collide in parliament. Representatives from one-and-the-same party move in partly different worlds. As a consequence, according to the authors, the analysis of political representation should not be limited to examining roll calls and other officially recorded actions—the sort of parliamentary actions where party discipline is of overriding importance. But members of parliament are not just puppets on the string of their party. The extent to which they act as representatives of local interests and policy views in introducing private bills is surprisingly great. This is presented as evidence that one should not overlook the importance of what individual members of parliament bring into the decision-making process, in addition to the importance of their party, which is known well enough.

Representation from Above really captivated me. It is written in plain language, the authors are never on a high horse, and the analyses are parsimonious and as simple as possible. Apart from a few stray regression analyses and a single factor analysis, all analyses are done at a level with which Paul Lazarsfeld, in his day, would have felt quite comfortable. This is not meant as criticism; quite the contrary. Methods should serve one's research questions and not the other way around. This is demonstrated here in an exemplary way: it is a book about politics rather than about advanced methods for their own sake.

I might dispute some of the arguments and interpretations on the two guiding principles of the book, representation from above versus representation from below and the merits of individualist versus collectivist models of political representation. The authors argue that the dispute between American and European scholars on the merits of these two models is too black and white. The main argument of European scholars against the individualist character of the dyadic representation model is that it is hardly feasible in the parliamentary democracies of Western Europe, for the simple reason that party discipline is such that there is hardly anything left to explain at the individual level. This debate refers to the representation of policy issues once it comes to formal decision making, such as roll calls. In spite of their argument, the authors implicitly seem to agree with what they call the European view. In their analysis of policy congruence between MPs and the electorate, they rely on nothing but collective representation. They do not even argue why they do not consider the application of a dyadic model of representation here, but rely immediately on the comparison of voters and MPs party by party. Where they make a case for a more nuanced view of the role of individualist modes of representation in the context of a parliamentary system, they refer mainly not to policy responsiveness but to allocation

and service responsiveness. However, a collectivist model of representation in which almost all formal decisions in parliament are made collectively—i.e., party-wise—does not exclude the possibility of MPs' serving the interests of their constituency, however defined.

None of this is meant to deny the importance of the analyses done at the level of the individual member of parliament, which do lead to important and sometimes surprising results. It is surprising indeed how much members of the Swedish parliament care about the problems and interests of both local and functional constituencies. However, it is precisely this finding that might have led the authors to a somewhat more nuanced conclusion with respect to the second major argument of the book: representation from above versus representation from below. The conclusion that representation runs more from above than from below is based completely on the comparison of the issue positions of the members of parliament of a particular party collectively versus the voters of their party. The nuance is that if responsiveness is defined differently than as policy responsiveness, members of the Swedish parliament turn out to be quite responsive, and obviously sensitive to sounds from below. But none of this has much of an effect on my judgment of this book. *Representation from Above* is excellent, based on excellent data, full of well-considered analyses, and a great contribution to the empirical literature on political representation.

Bureaucracy and Race: Native Administration in South Africa. By Ivan Evans. Berkeley: University of California Press, 1997. 416p. \$55.00.

Anthony W. Marx, *Columbia University*

Ivan Evans has provided an impressive historical analysis of the administrative emergence of apartheid. He ably argues that racial domination was based not just on coercion but also on institutionalization and socialization. Not satisfied with a simple state determinism, he looks inside the "black box" of the state to explain relatively autonomous policies influenced by economic interests, bureaucratic careerism, ideology, and opposition. The result is a portrait of routinized oppression that explains how the "banality of evil" actually develops. Scholars intrigued by South Africa's transition to inclusive democracy will be well served by this study, which provides crucial background on the extensive racial domination from which the postapartheid regime emerged.

Evans acknowledges that apartheid did not develop out of a uniform grand design, but at the same time he demonstrates a clear pattern of rising state intervention. Racial administration was bureaucratized, providing a new career path for social engineers. Centralization of power produced increasingly regimented outcomes, most notably the grids of cheap matchbox houses provided to black urban dwellers. As James Scott's recent work suggests in other contexts, state intervention produced damaging simplifications. The market was skewed by such intervention, guided by racist images of science and anthropology. The result was a highly effective form of social control by race, augmented by but not fully reliant on the use of force. And all of this was accomplished with careful attention to the bottom line (albeit very costly in other ways). Indeed, the construction of urban black townships was achieved relatively cheaply, with blacks encouraged to build for themselves within the regimented design and forced to pay for materials.

The urban experience is the focus of the first part of this book. Competing labor needs and interests of farmers,

mining companies, and manufacturing firms were managed by state authorities seeking the best possible compromise. The result controlled urban influx while providing sufficient cheap labor to the various economic sectors. Blacks themselves unwittingly cooperated, drawn into the urban schemes by their need for work and housing. And as black urbanization grew with the economy, so did the level of administrative and legal control. The extent of the regulation is revealed by the eventual criminalization of one in four Africans. Kept off balance by massive prosecution for any behavior violating apartheid, blacks were channeled into making the awful system work.

Admirably not satisfied with only looking at the more infamous urban controls, Evans focuses on the rural experience in the second part of his study. State authorities were long uncertain about how to maintain a rural home-base for the majority while ensuring sufficient urban labor. The solution was the reserves, later made into officially autonomous homelands. The system built upon the earlier British colonial practice of buying the loyalty of supposedly traditional chiefs and headmen. Self-serving black elites were recruited into positions of domination over their own people. "Tribalism" was justified by skewed anthropology, borrowing even from Nazi writings. And such categorization of the majority was used as a form of divide and rule, which was uneasily balanced with the overriding racial domination that risked unifying apartheid's victims.

The tension between rural ethnic policies dividing blacks and urban racial domination potentially unifying blacks refers to an important debate in South African historiography, which is not fully explored by Evans. Mahmood Mamdani's *Citizen and Subject* (1996) has provocatively argued that South Africa's use of ethnicity was comparable to the divide-and-rule tactics of colonialism elsewhere in Africa. Yet, as Evans notes, the racial basis of domination eventually superseded ethnic division, at the cost of indeed provoking a more unified black opposition. Was this outcome simply a reflection of rising urbanization, in which ethnicity was diluted? Was it demographically determined? In my view, the increasing focus on race over ethnicity was not determined by bureaucracy but by national-level electoral competition and issues. This dynamic gets short shrift in Evans's analysis, pushed aside by considerations of administration and economic interests. His project of looking inside the black box of the state would be furthered by greater focus on politics per se.

The author's larger point, that apartheid worked not just because of force but also because of effective administration, stands. Max Weber's combined focus on force and bureaucracy is vindicated, with only legitimacy crucially missing from the apartheid state. Yet, Evans suggests, despite his own argument, that even legitimacy of an odd sort was evident, at least among whites. The very effectiveness of racial administration won respect from the unexpected quarters of former liberals within the bureaucracy. Here, Hannah Arendt's analysis and Eichmann's shadow of banality falls on South Africa. But was apartheid so banal? Certainly, its bureaucracy was, almost by definition, but it took orders from white elected politicians driven by less banal imperatives and ideology. Evans would not dispute this, though he largely overlooks what determined the direction of policy. Still, his well-researched study breaks ground in showing how one of the most developed, evil instruments of social engineering in this century, the apartheid state, gained effectiveness in implementation and enforcement.

Threats to Democracy: The Radical Right in Italy after the War. By Franco Ferraresi. Princeton, NJ: Princeton University Press, 1996. 311p. \$35.00.

The French National Front: The Extremist Challenge to Democracy. By Harvey G. Simmons. Boulder, CO: Westview Press, 1996. 285p. \$19.95.

William Safran, *University of Colorado at Boulder*

Of the making of books on right-wing extremism there seems to be no end. The persistence of radical-Right political movements, especially in Western Europe, in face of a growing consensus about institutional democracy continues to baffle social scientists, who are engaged, as before, in examining the root causes, ideological foundations, and popular support of these movements. These two books make a significant contribution to this effort; both are thorough, judicious, and impressively documented, and both cover the essentials: the circumstances surrounding the rise of the movements with which they deal, their internal structures, their dogmas, and their relationship to other political organizations. Franco Ferraresi's book is particularly welcome, because it is the first detailed examination of extreme-Right political activity in postwar Italy to go far beyond the numerous studies that have tended to focus on the Italian Social Movement (MSI) and its electoral fortunes. Ferraresi analyzes the background of the MSI, the changes in its post-Mussolini leadership, its connections with other extreme-Right formations, and its attempts to adapt to the changing context, notably the political evolution of republican Italy.

Ferraresi tackles the difficult problem of Italian right-wing ideology, which appeared to draw much of its inspiration from German romantic, organic, and mystical nationalism. That inspiration was particularly exaggerated during the short-lived Nazi puppet regime. As a part of his effort, the author provides an extensive treatment of the ideas of Julius Evola, one of the major fascist ideologues, whose contributions have been largely ignored by Anglo-American scholars of Italian right-wing extremism. In attempting to deal with the "generic" features of fascism, Ferraresi usefully reminds us of the difficulty of placing it on the Right-Left continuum and points to a well-known "paradox" (p. 33). On the one hand, fascism in Italy, as elsewhere, has been clearly right-wing in its elitism, hero worship, statism, collusion with business, and contempt for the masses. On the other hand, in the context of the reality of competitive elections—and while maintaining its anti-Marxism—Italian fascism had to appeal to a significant section of the electorate in order to make its influence felt, and in so doing it proclaimed its opposition to capitalism and to traditional bourgeois attitudes. As Ferraresi insists, however, the fascist interest in mass support was purely instrumental and, ultimately, not followed up with policies evincing a credible concern for the problems of the masses. (That the fascists were often successful in obtaining such support may tell us something about the rationality of the political behavior of the masses.)

The democratic "adaptation" of the MSI to Italy's national political developments was signaled by its growing moderation, which gained momentum in the 1960s, when the Christian Democratic Party moved toward the center, and the MSI began to feel marginalized. At the same time, it could not break completely with other right-wing formations to which it was related; among these were the Ordine Nuovo (ON) and the Avanguardia Nazionale (AN), which Ferraresi discusses in some detail. He also devotes considerable space to terrorist movements, which may disconcert those who tend to identify Italian terrorism exclusively with the radical Left.

In reading this book, we learn a great deal about the Italian polity as a whole—its institutional confusions, its strata of

corruption, and the "spongelike features" of the whole system (p. 142), which (at least before the shakeups of the early 1990s) absorbed, controlled, and often colluded with the MSI and other organizations usually referred to as "antisystem." Ferraresi calls particular attention to the secret service, the police, the military, segments of the judiciary, and—until its *apertura a sinistra*—the Christian Democratic Party. These relationships are illustrated by several case studies involving corruption, disappearances, assassinations, and attempted coups d'état. The author's knowledge about such matters derives in large part from his role as a consultant with a parliamentary committee of inquiry on political massacres. These events are interesting in themselves, but they are recounted in so much detail that we tend to be overwhelmed by them.

In his excursus on the evolution of radical-Right ideology, Ferraresi provides many useful comparisons with Germany but hardly any with France. It would have been interesting to contrast the thinking of Evola with that of, say, Maurras; to compare the ON and similar organicist and elitist Italian "study groups" with the French GRECE; to explain more fully why right-wing extremism in Italy was accompanied by a much greater degree of violence than were similar orientations in France; to explain why the MSI had more difficulty than the French National Front (FN) in accepting homo oeconomicus; and, finally, to elaborate on why the MSI never fully subscribed to the anti-Semitism of the German Nazis, neo-Nazis, and the FN. We are told that for the ON, the MSI, and even Evola himself the Jews were only a symbolic enemy, part of a whole array of enemies, whereas for FN leader Le Pen the Jew is the enemy *par excellence*. While the MSI's successor, the Alleanza Nazionale (AN), has been distancing itself from Nazism in general and from much of Mussolini's heritage, and its current leader, Gianfranco Fini, has abjured anti-Semitism and even called for the restitution of looted property to Jews, Le Pen has perpetuated a certain nostalgia for the Hitler regime and continues to be obsessed with Jews. To be sure, certain similarities between the AN and the FN persist; thus, the AN wants to maintain the "heroic dimension" of politics, a dimension often articulated in Italy from Mussolini's balcony, and the FN backdrop is often one or another statue of Joan of Arc.

An interesting finding by Ferraresi is the evolution of the Italian radical Right from an antisystem party toward the mainstream. This is an effort that the FN has not yet been able to match, as the study by Harvey Simmons indicates. Despite steady growth in membership and widening electoral appeal, the FN is still a marginal party, at least in terms of its representation on the national level, and it is considered by many to be a danger to democracy. The image of the FN owes a great deal to its antirepublican origins, of which Simmons provides a useful summary description. The FN drew its inspiration from the Action Française and a miscellany of other antidemocratic forces, and it emerged in the early 1970s under the leadership of Jean-Marie Le Pen as a rallying point of Poujadists, anti-Semites, xenophobes, unreconstructed Vichyites, adherents of the neofascist Ordre Nouveau, and erstwhile proponents of *Algérie Française*. The FN capitalized on the growing disaffection with Gaullism and on the backlash against the apparent disorderliness of the rebellions of 1968. Subsequently, it exploited for its own propaganda purposes the massive influx of immigrants and growing unemployment, on whose causal connection the FN has continued to insist. Immigration has contributed to a change in the texture of French society, which is becoming ever more "multicultural"; this development has led to a debate about the nature of the French nation and the threat

to traditional images of French national identity, a debate that has benefited the FN.

In an interesting chapter on women and the FN, Simmons provides some insight into one of the party's many ambiguities. The party clearly appeals to "macho" instincts, and for that reason as well as its identification with violence, women have tended to give the FN less electoral support than have men (here, some of the available exit polls would have been helpful). Le Pen has had some success, however, in gaining support from strongly Catholic women, not so much by evoking the warrior myth of Joan of Arc but by stressing traditional family values.

To round out the context within which the FN operates, Simmons refers to its relationship with GRECE, the Club de l'Horloge, and other right-wing clubs and think tanks. He devotes considerable attention to the heterophobia, racism, and anti-Semitism of the FN. Not only do these attitudes occupy an important space in the ideological baggage of the movement as a whole and of much of its electorate, but also Le Pen's Judeophobia has been reflected in the articulation of revisionist themes concerning the Holocaust and in charges about "double loyalty" and worldwide conspiracy. To be sure, the FN does not have a monopoly on anti-Semitism, nor—as public opinion surveys show—are all FN voters consumed by it, especially since the traditional preoccupation with Jews seems to be eclipsed by a growing animus toward the much more numerous Muslim Arabs. Moreover, it is a matter of controversy to what extent Le Pen openly voices stereotypical attitudes about Jews that are held by "mainstream" conservatives, among them presidents of the Republic. In any case, in order to make his point, Simmons provides examples of racist and anti-Semitic incidents.

Simmons deals extensively with the electoral tactics of the FN, including its relationship with Mouvement pour la France (MPF) and the "republican" Right, especially the Gaullist party. He points to the "copycat" behavior of Gaullist politicians, notably with respect to policies on immigrants and immigration, and he recalls the divisions within the Gaullist party and its ally, the UDF, about what attitude to adopt toward the FN, ranging from alliance building, adamant opposition, attempts to stay out of the debate, and efforts to ignore the FN while trying to recapture FN voters for mainstream conservative parties. This conflict is, in a sense, the obverse of the conflict *within* the FN between the ideological hardliners, who wish to demarcate themselves from "the gang of four," and the "moderates," who want to improve their republican image and increase their national respectability. One manifestation of this conflict has been what an FN leader calls "the vocabulary battle" (p. 217): the clever use of euphemisms (such as "antinational," "cosmopolitan," "mondialiste"), especially by those trying to compensate for the crass obscenities often uttered by Le Pen himself.

The analysis might have benefitted from further elaboration of a certain number of items: the FN relationship with the MPF and the Centre National des Indépendants, since both of these small formations have been regarded as "passageways" to the FN; the FN's economic programs (including its prescriptions for solving the unemployment problem, to the extent that these have been credible or have existed at all) and institutional ideas; and, finally, the evolving conflicts within the FN leadership regarding tactics, notably between Le Pen and Bruno Megret. But these minor points do not detract from the excellence of this finely tuned combination of chronological and topical perspectives.

The Cost of Being Female. By Sue Headlee and Margery Elfin. Westport, CT, and London: Praeger, 1996. 229p. \$65.00 cloth, \$22.95 paper.

V. Spike Peterson, *University of Arizona*

As their eye-catching title suggests, Sue Headlee and Margery Elfin set out to demonstrate that discrimination against women can be assigned a monetary value. Prompted by reflections on the government's Cost of Living Adjustment index (COLA) and the gender gap in earnings, the authors produce a Cost of Being Female (COBF) index intended to facilitate both comparative studies and policy recommendations. Individual chapters present five aspects of the COBF (economic, political, social, educational, and health measures); the COBF in Sweden, Norway, France, and China; the COBF in England, France, and the United States in the nineteenth century (reviewing the impact of industrialization); a comparison of the COBF across generations in the United States from World War II to the present; and a short conclusion gathering these comparisons into a chart and making ten policy recommendations. Throughout, the authors insert brief narrative excerpts from women's lives and experiences, derived from interviews with seventy women over the past five years.

The economic aspect of the COBF—women's earnings as a percentage of men's—is the most familiar and easiest to document. While recognizing that discrimination does not account for the entirety of the difference between men's and women's wages, the authors defend using the full earnings gap as an appropriate proxy of the economic cost of being female. The authors analyze why the majority of women now work for wages and document differing costs for single, married, parenting, and childless women. Conventional reasons for and analyses of the pay gap follow.

The authors recognize that discrimination in the workplace is too narrow a measure of what it costs to be female. In their words, "Equal pay itself does not answer our desire for justice" (p. xxiv). The chapter on a political dimension presents conventional points about women and politics, with specific treatment of the apparent (1992) but then attenuated (1994) gains for women in recent elections. Arguing that high campaign costs impede women's entry, the authors recommend public financing of elections. They identify women's lower status and "supporting roles" due to childrearing expectations as the COBF in social life, and select the number of children per woman as its measure. The COBF appears to be the least in regard to education. The authors note, however, that females receive less an inferior than a *different* education (less math and/or career oriented), which effectively reproduces gender inequalities. Regarding health, the authors point out inferior funding for women's health concerns and gender bias in medical studies; they recommend preventive care, public support for family planning, and universal health care.

By reference to the five aspects of COBF, the authors' national comparisons illustrate the singular importance of child care and support parenting in determining the COBF. The historical chapters illustrate how industrialization realigned gender relations and how costs have varied generationally from 1945 to 1995. The authors conclude that the *objective* COBF is "lower now than a generation ago because women have moved out of the separate sphere of the home into economic life" (p. 201), but that the *subjective* COBF is actually higher because social changes have not kept up with economic ones. Working for wages simply *added* an extra shift for women, who also confront less role security because

what they do no longer matches traditional—and not much altered—expectations.

I agreed to review this book because I expected (from the publisher's blurb) a wealth of current data along a variety of dimensions and an interesting comparison of gender discrimination in five countries. I appreciate cross-generational attention, which enriches our understanding of how women are differently positioned in relation to experiences of, and attitudes toward, discrimination. I applaud attempts to humanize statistical data, in this case by inserting real women's narratives. And I value comparative studies. Moreover, in spite of my reservations about reducing complex social phenomena to numbers, I thought a cost-benefit analysis of gender discrimination might be particularly effective: it would enjoy immediate appeal in a culture committed to quantification and consumption, and its presumably less equivocal analysis might be of particular value in clarifying and promoting a "progressive" political agenda.

The book does present a great deal of information, but in spite of its increased availability (due to feminist research and activism), the currentness of the data varied widely, and at some expense to the quality of the work. I was also exasperated by apparent inconsistencies. The rate of participation of U.S. women in the workforce was 57% on page 2, but on page 130, "a higher percentage of French women work for pay than American women—57 percent compared to 51 percent of American women." Particularly confusing was the identification of both 71 and 59 cents as women's proportion of male earnings in the United States; only on page 210 do the authors finally clarify that the differing statistics are due to different sources (reliance on U.S. Department of Labor [71 cents] versus United Nations [59 cents]). And in their capstone summary chart of the COBF Index (p. 209) they show the educational gap in the United States today as 110 in one row, 30 in another—a dramatic inconsistency. Close reading of explanatory notes revealed 110 as reference to "ratio of female to male graduates from college," whereas 30 referred to "percent of females [in the population] graduating from college"; two pages later the text clarifies that "today" in the latter instance is 1960! In short, the inconsistencies were not so much errors (the authors report their research accurately) but irritations (the reader has to work too hard to make consistent sense of the text).

Unfortunately, the narrative excerpts failed to make the statistical data come alive. Perhaps, because of space constraints, it is simply not possible to include the detail required to paint a picture of "real" people. But the text as a whole suffers from what I experienced as a wooden writing style, particularly apparent in the narrative excerpts.

Finally, I remain ambivalent about reducing complex social phenomena to numbers. On the one hand, I want people to be aware of gender discrimination, and quantitative measures offer stark evidence that women literally pay a price for being female. Given today's backlash against feminism and the continued obfuscation of women's structural subordination, I commend Headlee and Elfin's desire to make the cost of being female visible. On the other hand, relying on quantitative analysis imposes its own costs. From my vantage point (and briefly), this book pays its highest costs in terms of narrowness. By narrowing their focus to five single measures (wage gap, percentage legislative seats, children per woman, maternal mortality, percentage college graduates), the authors sacrifice attention to significant features of real women's lives (for example, systemic objectification of and violence against females). In a related sense, by focusing on women, men drop out of the picture even as the dichotomy of men versus women is maintained. In a different sense, the

book is specifically narrow in its uncritical presumption and promotion of "traditional" families and heterosexuality. I do not expect all gender-sensitive work to engage these issues in depth, but complete silence is problematic. As a final concern, the five incommensurate single-score indices that constitute their ultimate COBF index are so narrow as to be of limited utility, especially for comparative studies.

In spite of these reservations, I acknowledge that Headlee and Elfin have a good, catchy idea. Focusing on costs has appeal, and publicizing the costs of being female has feminist appeal. By combining indisputable facts with accepted argumentation and a nonconfrontational tone, the book's strength may be its utility in introducing students to the real world of gender discrimination.

The Social Psychology of Protest. By Bert Klandermans. Cambridge, MA: Blackwell. 1997. 257p. \$21.95.

John D. McCarthy, *Pennsylvania State University*

During the last two decades we have witnessed the emergence of an immense and vigorous scholarship on collective action. Political scientists and sociologists working under a variety of theoretical banners (such as resource mobilization, political process, political opportunity, new social movements) have crafted diverse macrostructural accounts of the timing and social location of public protest as well as the emergence and development of social movement organizations around issues as diverse as civil rights, the environment, gender, peace, and sexual orientation. These many complementary accounts were motivated, in large part, by a rejection of the earlier, excessively psychological, and for the most part poorly documented accounts that had dominated collective action scholarship during the early Cold War. Those who claimed there was no need for a special social psychology for activists achieved theoretical dominance, despite the fact that, as John Lofland has noted, the bulk of published research remained focused upon the participation of activists.

Recently, however, a number of articulate critics of the pervasiveness of the new theoretical accounts of collective action have claimed that one risks throwing out the baby with the bathwater by marginalizing social psychological accounts of participation in public protest and social movement organizations. The accounts take mostly for granted the three key cognitive processes that underlie individual activism: (1) coming to understand that one's personal circumstances are the result of a public problem, in C. Wright Mills's classic formulation, (2) choosing to act upon such an understanding, and (3) sustaining or abandoning the new-found commitment to act.

Bert Klandermans vigorously pursued his own distinctive research agenda during the same period that the macrostructural accounts came to dominate, one motivated, instead, by an unwavering commitment to making central the problematics of the three key cognitive processes underlying activism. *The Social Psychology of Protest* is an impressive synthesis of his own extensive research on these processes with a widely diverse research literature on individual collective action participation. Unlike many of the critics of macrostructural hegemony in this scholarly arena, Klandermans seeks a detente by, first, specifying a narrow scope for a social psychology of protest by limiting the questions it should be expected to answer (how to explain the timing, form, intensity, and persistence of individual participation in public protests and social movement organizations) and, second, attempting to specify the broader social structural contexts that shape individual participation decisions (variable social

movement organizations, multiorganizational fields, and political opportunity structures).

The social psychological principles Klandermans deploys to explain variable individual movement participation are an eclectic mix. His scheme melds elements of value expectancy theory (behavior is seen as a function of its *expected outcomes*, which are in turn partially a function of the expectation of the behavior of others), collective action theory (especially the implications of the key distinction between selective and collective incentives), and theories of organizational psychology (featuring a synthesis of accounts of variable affective and normative commitment to social movement organizations) in order to account for individual decisions to participate, the preferred forms of participation, and trajectories of participation.

Devotees of any particular theoretical perspective are not likely to come away pleased with the resulting theoretical melange, yet it allows Klandermans to make convincing sense of a variety of empirical patterns of participation in the Dutch antimissile mobilization of the 1980s, several Dutch labor union campaigns, various phases of the Dutch women's movement, as well as in collective action in postapartheid South Africa (based upon national surveys carried out there in collaboration with Johan Olivier). His success in applying his thoroughly unpolemical synthesis to the interpretation of such diverse empirical evidence is a strong advertisement for its general utility.

A substantial portion of the empirical and theoretical leverage achieved by the analyses depends upon the use of time; Klandermans marshals evidence on individual careers of participation, social movement organizational life cycles, and protest event cycles (an appendix touts the methodological requirements and theoretical utility of this class of research designs). As is widely understood, when research designs integrate time, they allow for far more robust causal interpretations than do cross-sectional ones. But they also demand more diachronic theoretical accounts, moving the center of interpretive gravity from static attitudinal and characterological ones to dynamic contextual ones that include responsive actors, as Klandermans demonstrates.

The author elaborates a rich set of conceptual tools and employs them with telling effect throughout the book. The scheme he offers for categorizing forms of protest participation (a joint function of the effort required and its duration) is more theoretically grounded than similar widely used schemes. With it Klandermans is able to generate strong predictions about the differing motivational dynamics governing, for instance, taking part in a protest event versus regular volunteer work in a movement organization—ideological commitment is more important, he argues, in accounting for the latter. Similarly, his elaboration of the distinction between consensus and action mobilization (altering predispositions versus participate or generating participation itself) allows him to specify more appropriately the goals and consequences of the many efforts of movement organizations. A failed attempt to bring thousands of supporters into the streets can, under the right conditions, generate widespread sympathy for their goals, for instance. His consensus/action mobilization terminology has already been so widely appropriated by social movement analysts that it is now rarely attributed to Klandermans.

Bert Klandermans has succeeded, then, in writing a quite valuable book which fills an important intellectual niche, the boundaries of which he has been instrumental in establishing. He is ideally situated to attempt a grand synthesis like this one, since he has been a roving ambassador of collective action research among disciplines and continents for the last

twenty years. Those activities provided him access to the best current collective action scholarship, which provides the bedrock of his synthesis.

Nevertheless, the book is not without minor flaws. Its focus is almost exclusively upon the motivations and behavior of rank-and-file activists rather than leaders, mirroring the collective action research landscape, a problem acknowledged by Klandermans. Finally, the book would have been improved by better copy editing. It is replete with inelegant phrases and awkward sentences that detract from the generally cogent line of argument. Regardless, *The Social Psychology of Protest* is likely to stand for some time as the most comprehensive effort to craft a social psychology of collective action.

Out from Underdevelopment Revisited: Changing Global Structures and the Remaking of the Third World. By James H. Mittelman and Mustapha Kamal Pasha. New York: St. Martin's, 1997. 289p. \$55.00 cloth, \$16.95 paper.

Understanding Development: Theory and Practice in the Third World. By John Rapley. Boulder, CO: Lynne Rienner, 1996. 203p. \$42.00 cloth, \$17.95 paper.

Bruce E. Moon, *Lehigh University*

Few policy areas have witnessed the rapid swings of sentiment, the fierce ideological divisions, and the technical complexity that make Third World development so daunting a subject for outsiders. These two books provide an effective introduction to this fractious literature for the intended audience of generalists and students, though there is little new here for development scholars.

Rapley organizes his exposition around a timeline of development theory's shifting fashions concerning the relative role of the market and the state. He begins with a review of classical theory's homage to the free market, a primer on the Keynesian response, and a brief summary of the state of the Third World through the middle of the twentieth century. With these pieces assembled, he outlines the basic elements of development thinking in the postwar era: the initial structuralism associated with ECLA and various strands of modernization and dependency theories. Chapter 2 then examines statism as the policy upshot of this theoretical melange, though he correctly notes (p. 27) that "events, rather than theory, drove the early experiments with import substitution industrialization (ISI)." He argues that the statism exemplified by the initial successes of Latin American ISI eventually fell victim to the crises of the 1970s. In the following chapters, Rapley plays out his thesis that development theory and practice have moved more or less together in a continuing pendulum swing. Chapter 3 documents the reemergence of neoclassical thought in the 1980s in response to the discrediting of ISI, and chapter 4 examines structural adjustment policies as the embodiment of that neoclassical theory. Chapter 5 sketches the disparate responses to the evident limitations of structural adjustment, emphasizing the reemergence of the Left and the appearance of the "developmental state" model to encapsulate the economic successes of East Asia. Rapley seems to embrace this "new statism," but chapter 6 offers a generally pessimistic assessment of prospects for successful implementation of the model elsewhere, especially in Africa, due both to internal limitations (especially the weakness of the state) and international obstacles. Indeed, he correctly notes that African states, under the pressure of austerity, are generally moving away from this expansive role. As he adroitly does throughout the book, Rapley supports this claim with thumbnail sketches of the experience of several countries.

By emphasizing a close link between development theory and the actual practice of economic policymaking, Rapley grounds the discussion in a way that will be much appreciated by both students and their instructors. Others may find this account somewhat antiseptic because it downplays the role of domestic politics, ideology, and international financial institutions, but any 200-page work that covers the waterfront of development must compromise somewhere.

Whereas Rapley's account is somewhat more neat than the underlying phenomena it portrays, the book by Mittelman and Pasha is more chaotic. In part this is because their work is centered more around problems and policies than theory, but it also is organized much more loosely. In fact, though this second edition is coauthored, the overall structure and feel of the book remains that of a personal journey by Mittelman, the single author of the first edition. It begins with his own earliest exposure to the Third World in an entertaining six-page introduction to the first edition, and observations from Mittelman's African fieldwork pepper the remainder of the work. The book champions a structural perspective rooted in theory, but an unconventionally eclectic approach is used to elaborate it. The result is hit-and-miss. For example, chapter 1 decries the simplistic understanding of the Third World proffered by public media, but it is not enhanced by a two-page excerpt from the 1977 interview with Fidel Castro by Barbara Walters, which centered on personal questions about marriage and family. Yet, the critique of modernization theory and explanation for the rise of dependency thinking in chapter 2 is enlivened by a three-page excerpt from the work of a Ugandan poet. The critique of international organizations, foreign aid, and transnational corporations in chapter 3 will seem tired to experienced readers, but these familiar points are made in a spirited way that will capture the imagination of those new to this way of thinking. Chapter 4 introduces the rudiments of Marxist ideas on development in an accessible way.

Extended case studies rather than idealized models are used to portray the three strategies of accumulation open to Third World nations: "Join, leave, or weave." Chapter 5 illustrates the option of joining global capitalism with a fine description of the Brazilian "miracle" (1967-74) that emphasizes its inequitable distribution and unsustainability. The historical narrative sketches the events and conditions that preceded this justly (in)famous episode and chronicles the developmental tragedies that have ensued. Unfortunately, the account of Brazilian policy swings over the last 50 years may tend to confuse readers seeking a single model of what it means "to join." Furthermore, the only new chapter in this edition (the sixth, drafted by Pasha) offers the "miracle" of the Asian NICs as a variant on this option, downplaying the diversity of policy approaches undertaken across these cases and over time. Several theories purporting to explain their success are skillfully delineated, but this exposition gives no hint of the trouble to come for these East Asian success stories. As does nearly every other commentator, Pasha has reservations about this developmental model that are much more related to its social and political dimensions than to its economic sustainability. (One wonders how much more pessimistic their assessments would be today, when the East Asian miracles appear not merely untransferable but, even in themselves, temporary and illusory.) His forecast that this model will not be widely applied elsewhere—because, as Pasha adeptly explains, the conditions favoring success were unique in time and space—will surely fare better. Chapter 7 explores the "exit" option, using as an illustration China under Mao, with a brief discussion of the "reentry" under Deng. Mozambique is an example of the alternative path of

"weaving through global capitalism" in chapter 8. Unfortunately, much of this treatment seems dated now, and the theoretical and/or policy lessons to be drawn from these historical narratives are not clearly articulated.

The divergence between the two books is captured by Mittelman's observation that "neophytes seek an account that de-mystifies the issues, while many experts write about what their fellow experts say about the topic." Rapley does indeed write about what the experts say, but he does so with a rare clarity that makes accessible a literature teeming with the contributions of theorists, area scholars and policy analysts, and the perspectives offered by economists, political scientists, and sociologists. He injects greater analytic depth than is usually found in a survey of such diversity, and yet he does it in a compact work that should prove very attractive to both the student and the nonspecialist. The latter especially will appreciate the frequent references to historical events and cases as well as the theoretical snippets dotting the book. While the organization of *Understanding Development* is surely theory-centric, it by no means short changes policy practice. Many of these references are too brief to inform an inexperienced reader fully, but they will provide a helpful grounding for the informed nonspecialist and fodder for expansion by classroom lecturers. Furthermore, ample footnoting points the way to most of the classics of development theory. By contrast, the complete absence of footnotes limits the value of *Out from Underdevelopment Revisited* as a springboard to further reading, despite a lightly annotated bibliography at the end.

Important similarities in the messages of these books are revealed by the way they conclude, speaking to the current state of development theory and practice while looking ahead to the future. Both close with more hope than despair but also with more questions than answers. Rapley ends with the forecast that development theory has now reached a revolutionary phase marked by the search for a new paradigm, but he also suggests that profound cultural differences limit the universality of any development theory. The final section heading of *Understanding Development* asks: "What is the future of leftist thought?" The ambiguous and optimistic answer is in the first sentence of the Introduction: "The left is dead; long live the left."

Mittelman and Pasha are even more emphatic on each of these points. The central mission of their book is to demonstrate that hopeful alternatives exist to neoliberal orthodoxy, most of which emanate from ideas associated with the Left. The choice among them, however, cannot be prescribed universally by theorists, most especially those from the North, but must be made "by those engaged in praxis under markedly distinct conditions and most directly in touch with the specific contradictions that beset their lives" (p. 242). Finally, *Out from Underdevelopment Revisited* ends with a chapter entitled "What Works in the Third World?" Despite their best efforts, neither volume has convinced this reviewer that the answer is not "not much."

A Morbid Fascination: White Prose and Politics in Apartheid South Africa. By Richard Peck. Westport, CT: Greenwood, 1997. 216p. \$57.95.

Audie Klotz, *University of Illinois at Chicago*

For those only aware of Nobel Prize-winning novelist Nadine Gordimer, or Alan Paton's consciousness-raising classic, *Cry the Beloved Country* (1948), Peck's *Morbid Fascination* will serve as a useful introduction to a diverse array of English-language writers, not least the Tom Clancy of southern

Africa, Wilbur Smith. Indeed, to find any patterns across such various styles and subject matters is an achievement. Yet, Peck's thesis, that these and the other writers he covers exhibit both a fascination with and a distaste for politics, falls short of the deeper analysis warranted by his subject.

Peck somewhat apologetically limits his study to white writers in English. The book devotes separate chapters to Smith, Gordimer, and mystery writer James McClure; other chapters cluster a few novelists together under common themes: mysteries, liberalism, antiapartheid, existentialism, and theater. Included are Herman Charles Bosman, Wessel Ebersohn, June Drummond, Christopher Sherlock, Bryce Courtenay, Shawn and Gillian Slovo, Laurens van der Post, Dan Jacobson, Phyllis Altman, Mary Benson, and Athol Fugard. It is hoped that readers will be inspired by Peck's overviews to explore many of these authors in the original.

One can always question the exclusion of particular names from such a broad list, but especially given the inclusion of Fugard and performance artist Pieter-Dirk Uys, the decision rules remain murky. Certainly, André Brink, best known for *A Dry White Season* (1979), deserves more attention. Additional authors who also bridge the English-Afrikaans divide, such as J. M. Coetzee, warrant a separate chapter. Inclusion of black playwrights also calls into question the proclaimed focus only on white prose, especially in theater which frequently sought the same audience and market. Nonetheless, Peck's work should be evaluated on its own terms.

In his discussions of various writers, Peck focuses on their implicit and explicit views in order to identify a common "morbid fascination," in essence an ambivalence about politics. Unfortunately, this analysis is not sufficiently literary to add significantly to our understanding of the texts. Organizing the discussions more around themes might have enhanced the work. For example, Peck indicates a number of political myths, and he could have traced these more systematically across authors.

More disappointing for political scientists, Peck could have illuminated more strongly the context in which these authors were working. Only in passing does he acknowledge the constraints of apartheid (pp. 9-10), a system of institutionalized racial discrimination which relied in part on some of the harshest censorship laws in the world. Displeasing the government could result not only in one's work being banned from store and library shelves, but also in the author being restricted from speaking publicly, being quoted in the press, and meeting with more than one person at any time. Theater productions were frequently shut down. And, of course, many opponents of apartheid served prison sentences. Under these circumstances, it is difficult to imagine writers having opportunities to express their political views openly.

Peck fails to explore the possibility that the ambivalence about politics that he identifies across these works is an artifact of such repression, rather than the result of common political views of the authors or, more generally, liberal English-speaking whites in South Africa. Readers should turn to Brink's *Writing in a State of Siege* (1983), for example, for insights into these dynamics. Gordimer (*The Essential Gesture*, 1988) and others have also penned essays on the difficulties of working under apartheid restrictions. Literature produced in the postapartheid era will help us sort out the role of previous censorship and repression in the arts.

In addition to underemphasizing domestic political constraints, Peck only hints at the importance of international criticism of apartheid. Publishers are global businesses and thus sensitive to the reception of South African authors overseas. Granted, cultural boycotts affected theater and some films more than literature. But it remains unclear just

how much Gordimer's particular knack for explaining the ironies of apartheid to foreigners is responsible for her international stature. Perhaps international criticism of apartheid drove writers to be more explicitly political than their own proclivities; in any case, authors were unavoidably evaluated on their political views. Such a politicized context for the arts surely had an effect on literary content. Although Peck raises some of these issues indirectly, questions at the intersection of political economy and culture deserve more sustained attention.

A Morbid Fascination stakes out important territory for gaining a better grasp of South African politics. Literature, arts, and sports played critical roles in both the nationalist ideology that underpinned apartheid and the struggles against it. It is hoped that others will follow in Peck's footsteps but travel farther in exploring more fully the relationship between culture and politics.

The Grand Experiment: Debating Shock Therapy, Transition Theory, and the East German Experience. By Andreas Pickel and Helmut Wiesenenthal. Boulder, CO: Westview, 1997. 262p. \$53.00.

Anders Åslund, *Carnegie Endowment for International Peace*

The subtitle of this book describes its contents accurately. It deals with the postcommunist transition in former East Germany and related themes, such as shock therapy, democracy, interest representation, myths, and ideology. The political scientists Andreas Pickel and Helmut Wiesenenthal have written five articles each; they collaborated on the introduction and the conclusion.

The East German experience is astounding. Between 1990 and 1995, the average monthly wage rose from one-third of the West German level to three-quarters. Is this not an economic wonder? "No," the authors firmly respond, because the rise was accomplished through injection of an incredible \$800 billion from West Germany until 1996. But is this not an extraordinarily idealistic deed, and are not the East Germans grateful? Again the answers are negative. The East German economy collapsed in the process, and unemployment rose higher than in any other postcommunist country. The questions are: Why did East Germany do so badly despite massive resources, and what is the broader relevance of the East German transformation?

The main contribution of this book is a substantial critique of the political economy of the East German transition, primarily delivered by Helmut Wiesenenthal. His judgment is that the German debate about the transformation of a former communist country was badly underdeveloped, as these problems were not taken seriously. He blames mainly two policies for the economic damage: the restitution of property and wage policy. The restitution of millions of properties spawned legal disputes that stalled the usage of much property for years, and sharp wage hikes swiftly priced much East German labor out of the market.

Wiesenenthal's main original contribution is the point that this occurred because of "the way problems were defined, the range of policies considered, and the criteria employed for decision-making," which "bear a strong bias in favor of West German policy traditions and interests" (p. 60). His best example is the wage settlement. The decisive agreement was made in the metal industry between all-German trade unions and employer associations in early 1991, and Wiesenenthal concludes that neither party "acted on behalf of predominantly East German interests" (p. 62). Neither cared that

their agreement effectively put most of East German industry out of business, and the German government was not directly responsible. A similar example is the medical associations, although Wiesenenthal finds that housing associations and farmers' associations accommodated East German interests. Wiesenenthal evokes an image of strong but inconsiderate West German interest groups and weak and confused East Germans. Formal democracy persisted, but that did not solve the problem. The end result is alienation and unnecessarily high social costs. No one really wanted a bad outcome, but far too few gave much thought to what would result.

Andreas Pickel tries to put East Germany into the broader context of postcommunist transformation. His premise is that "the former GDR represents an ideal empirical test case for the strengths and weaknesses of the radical strategy" (p. 73). He goes on to argue: "Rapid and comprehensive reform has not created the conditions for self-sustained economic development, as had been expected" (p. 73). A long criticism of shock therapy ensues. This line of argument fails to convince. The first problem is that Pickel interprets shock therapy as holistic social engineering. He takes that point from opponents of shock therapy, but the proponents of radical market reforms are against any detailed future plan and instead see their strategy as a constructive first step in the reform process.

The second problem with Pickel's criticism is that he argues shock therapy took place in East Germany, which Wiesenenthal disputes. The outstanding peculiarities of the East German transformation were that wages were regulated far above the market clearing level and that East Germany was flooded with Western social transfers. These are not market economy peculiarities. Although the government was center-rightist, the essence of this policy was social democratic. The East German situation is best described as a social welfare trap. People are so well paid through social security that it would be irrational for them to work, but they regret not having meaningful activity. Therefore, Pickel's contention that East Germany is a special case of shock therapy and holistic social engineering is rather pointless, because its social democratic kind of policy is not the ordinary meaning of shock therapy. East Germany remains a peculiar case of postcommunist transformation, because only the West German government has so much money to spend, and in the future we are likely to see this as foolhardy waste.

Pickel also discusses whether radical market reform is compatible with democracy. He observes that several political scientists, notably Jon Elster, Claus Offe, and Adam Przeworski, doubted early on that democratization and marketization could be combined, but they have been proven wrong. Populism has not turned out to be a major problem. Nor would a reversion to authoritarianism improve the chances for successful economic transformation, since the real threat has largely proven to be the old elite. Yet, despite very limited evidence, Pickel implies that neoliberals would be inclined toward authoritarian policies. His strongest quotes come from Silviu Brucan, whom I would place in the communist camp. A substantial literature in the last decade suggests that democratization and radical market reform are positively correlated.

Since this is essentially a political science book, economics is treated in the margin, but radical reforms have proven more economically successful than gradual reforms. The excessive social costs of radical reforms anticipated by many leftist political scientists never arose, while gradual reforms have turned out to be extremely costly. Hence, radical reforms and democracy have gone hand in hand, as have minimal reform and dictatorship.

The book is well written, and the authors are well read, thoughtful, and open-minded; a useful bibliography is included, as well as an index. A drawback is that both authors tend to discuss the same issues, making the book rather repetitive. Yet, to my knowledge it is the best work in English to date on political aspects of the East German transformation.

Overlooking Nazareth: The Ethnography of Exclusion in Galilee. By Dan Rabinowitz. Cambridge: Cambridge University Press, 1997. 222p. \$59.95 cloth, \$19.95 paper.

Sammy Smootha, *University of Haifa*

Rabinowitz's study has two levels. On the micro level, it is a well-documented, insightful, and readable ethnography of the troubled encounters between Arabs and Jews in an Israeli town. It is less satisfying on the macro level of analyzing the problematics of the status of the Arab minority in the Jewish state.

The town of Natzerat Illit was founded in 1957 on expropriated lands from residents of Arab Nazareth. It was officially built as an exclusively Jewish town and as part of the national project of Judaization of the Galilee. Due mostly to shortage of housing, Arabs from Nazareth, mostly middle-class Christians, moved to Natzerat Illit during the 1970s and 1980s (constituting 13.5% of the total population of 21,800 in 1989).

Rabinowitz, an Israeli critical anthropologist, did fieldwork for his doctoral dissertation in Natzerat Illit in the late 1980s. His book is not a comprehensive community study but a focused ethnography of the relations between the Arabs and Jews in the town. The area is conceived of as a frontier, where the Jews enjoy special opportunities and advantages, and the two sides compete and clash. The detailed accounts include the split real estate market, the separate educational system and community center, and the hardships faced by three professional Arabs—a medical doctor, a basketball coach, and a local politician.

The leitmotiv in the analysis is the failure of Jewish liberalism. The Jewish residents of the town object to the Arab purchase of housing and feel uneasy about receiving services from Arab professionals. The Arabs react with resistance to the Jewish strategy of exclusion. Yet, the end results of the high potential for conflict are quite surprising. Despite public agitation and ideological opposition, hundreds of apartments are sold to the Arabs for the benefit of all, relations are amicable, and there is no violence. Jews avail themselves of the professional services of the Arabs, notwithstanding the ill-feelings of status reversal. These benign consequences are not appreciated by the author, who chooses to emphasize the various manifestations of exclusion and discrimination.

It is the author's point of departure that the Jews, like himself, subscribe to liberal democracy and values but fail to practice their liberalism in daily life. The thrust of the study is to expose the Jews as "bigoted liberals" (the title of Part 1 of the book) and to point to their intolerant attitudes and behavior and their rationalizations. The issue is whether this framework of liberalism applies to Israeli Jews, society, and state. This takes us to the macro level of the study.

Israel declares itself as a Jewish and democratic state. It is constituted by law as "the homeland of the Jewish people." By law, no political party can register or run an election list to the Knesset if it denies this principle. The state's majority, symbols, calendar, institutions, culture, heroes, policies, and some of its laws are explicitly or implicitly biased in favor of the Jews. At the same time, Israel is a democracy, extending

individual and collective rights to the Arabs. These rights cannot be full and equal because of the Jewish-Zionist nature of the state and its preferential treatment of the Jews. There is a genuine contradiction between the Jewish and democratic nature of the state, which incessantly generates numerous insoluble dilemmas.

Israel is neither a liberal nor a consociational democracy. It is not liberal because the state is not neutral and does not treat Arab and Jewish citizens equally. It also does not try to form a new Israeli nation composed of both peoples. Neither is Israel a consociational democracy, because it does not treat Arabs and Jews as equal collectivities, and it does not institute any of the standard mechanisms of consociationalism (autonomy, proportionality, elite cartel, veto power, and the like). Rather, Israel is what I call an "ethnic democracy," which combines the contradictory principles of democracy for all with institutionalized dominance.

Liberalism is foreign to both Jews and Arabs in Israel. The Jews wish to keep Israel Jewish and democratic and oppose the assimilation of the Arabs, while the Arabs want to preserve their separate culture and identity but strive for equality without assimilation. The struggle is not about liberalism, which is rejected by both sides. Their clashes test the limits of the ethnic-democratic system and result in patchy compromises. Do Jews have the right to maintain a Jewish majority in the country as a whole? Do they have the right to build a Jewish majority in the central and western Galilee, where Arabs still constitute 70% of the population, and Jews fear Arab irredentism? Do Jews have the right to keep towns like Natzerat Illit Jewish? Do Jews and Arabs have the right to completely separate localities, neighborhoods, and schools? Do they have the right to object to intermarriage without being called "racist" or "bigot"? The answers to these questions are obvious only in a liberal democracy, but they are not clear in an ethnic democracy like Israel. To term the Jews "bigoted liberals" is to miss their inherent dilemmas. The Israeli Supreme Court is at present deliberating a case brought by an Arab who was barred from buying a unit in a building project in a small Jewish community. The ruling can go either way because of the dual nature of the state and the absence of unidimensional liberal discourse in dealing with such questions. The author claims to take the Jewish side "more seriously and less judgmentally" (p. 189). He does not. His ethnographic account airs many of these issues, however.

Aside from its misplaced liberal bias, this study deserves our attention for its fine ethnography and its touching on questions of ethnicity, nationalism, and democracy.

The Dynamics of Conflict in Northern Ireland: Power, Conflict and Emancipation. By Joseph Ruane and Jennifer Todd. Cambridge: Cambridge University Press, 1996. 365p. \$59.95 cloth, \$19.95 paper.

Arthur Aughey, *University of Ulster*

This book achieves a rare distinction in studies of the political conflict in Northern Ireland. It scrupulously avoids a polemical tone and almost never moralizes. For the most part it assesses the claims of the parties to the conflict in the manner in which they should be assessed—unsentimentally and with a coolly rational eye. Unsentimentality and cool rationality, however, do not prevent the authors from showing a sympathetic understanding of the conditions (or "structures," as they put it) in which such claims are made. Ruane and Todd achieve what they set out to do, which is to take seriously the points of view of Unionists and Nationalists while subjecting

their assumptions to critical scrutiny. It is a measure of their success in this endeavor that the book can take its place alongside the late John Whyte's magisterial *Interpreting Northern Ireland* (1991) as essential reading on the subject.

The enormous and patient labor of John Whyte distilled the academic literature on Northern Ireland into a set of propositions which have been not only accessible to students but also persuasive to academics. Ruane and Todd's study is an equally richly textured work of synthesis drawing on a wide body of literature, and like Whyte, they offer well-judged views without being self-righteously judgmental. They are broad minded and tolerant, providing the reader with a clear-sighted guide to the conflict in concise, yet subtle and intelligent, surveys of what the authors call the "dynamics of conflict"—economy, culture, politics—and what might be called the external context of the conflict—Great Britain, the Republic of Ireland, international opinion, and especially the views of opinion leaders in the United States and the European Union.

The great strength of the book lies in its realism (in the sense that it gives priority to a calculation, past and present, of the relative power positions of Unionists and Nationalists). In the debate about the historical character of the Irish Question, the authors appear closer to the position of someone like A. T. Q. Stewart (*The Narrow Ground: Patterns of Ulster History*, 1977), who argues that the communities in Northern Ireland act according to patterns, even laws, inherited from the past, than to the position of someone like Brian Walker (*Ulster Politics: The Formative Years, 1868–86*, 1989), who proposes that these patterns are contingent, transient, and capable of significant change. Ruane and Todd are not absolute determinists, however. Theirs is a study of the enduring nature of communal conflict, though conflict which may take different historical forms and which need not be violent in its expressions.

Ten of the eleven chapters are written in this realist style. Ruane and Todd explore the first two elements of the book's subtitle, power and conflict, in which the continuity of political struggle is manifest. Only in the final chapter, and then only very briefly, is the concept of emancipation examined, a concept which intimates the possibility of qualitative change in the relationships between the two communities. The authors' "emancipatory approach to the conflict" represents their distinctive contribution to a "resolution" of the Northern Ireland conflict. Unfortunately, this is the weakest part of the book.

The language of most of the book, the language of "power and conflict," is generally taut, the arguments are well focused, and the explanations, though contestable, sharp. The language of "emancipation," by contrast, is vague, and the arguments are abstract and imprecise. This is not to say that the vision of a realm of freedom in which "new social and cultural potentials could be realized" (p. 307) is not an attractive one. But it is difficult to see, precisely, how the people of Northern Ireland, aware of themselves existing in a political condition not unlike Carl Schmitt's notion of a struggle between friends and enemies (*The Concept of the Political*, 1976)—Ruane and Todd's own words for this prevailing understanding are "a structure of dominance, dependence and inequality" (p. 107)—might willingly and together enter this realm of freedom. The logical jump from power and conflict to emancipation seems too wide.

For instance, Ruane and Todd are most persuasive and insightful when they explore the ways in which the cultural, symbolic, and mythical aspects of Unionism and Nationalism can be, and have been, formulated and reformulated in reasoned defense of substantial communal interests. And

they are sound in their criticism of the rationalist illusion of expecting—once having shown how mythological, irrational, and anachronistic ideological beliefs are—that these beliefs subsequently will fade away. Yet, in their desire to outline the lineaments of a "resolution," Ruane and Todd themselves adopt ultimately a rationalist perspective. They appear to assume that politicians and those they represent are capable of recognizing a common good which transcends the traditional and partial objectives of the respective constituencies. "Appear"—for it is not at all clear what they are proposing. Another reading of their position would be this. Since, as they claim, "the immediate source of conflict is the nexus of Northern Protestant dependence on the British state and dominance over Northern Catholics" (p. 309), then this dependence and dominance ought to be broken. Northern Protestants are the source of power and conflict. They ought to be forced to emancipate themselves. This might lead to a resolution of sorts but only of the sort which supposes that resolution can be achieved as the crow flies by Protestants being compelled to "see reason." The lack of clarity here may be the result of the authors' unwillingness to admit that conclusion. A settlement (rather than a resolution) is possible in Northern Ireland, but it is unlikely to be achieved in "emancipatory" terms (whichever reading one takes).

Despite its flawed conclusion, Ruane and Todd's book is full of insight and realist wisdom. It remains one of the best contributions to the study of Northern Ireland politics.

Parties and Their Members: Organizing for Victory in Britain and Germany. By Susan E. Scarrow. Oxford and New York: Oxford University Press, 1996. 277p. \$72.00.

Alan Ware, *Oxford University*

During the 1990s, the findings of a number of major research projects on party members and activists in Great Britain have been published. The most important have been Seyd and Whiteley's *Labour's Grass Roots* (1992), Whiteley, Seyd, and Richardson's *True Blues* (1994), and Norris and Lovenduski's analysis of the candidate selection process, *Political Recruitment* (1995). To this list can now be added Susan E. Scarrow's impressive first book, *Parties and Their Members*.

This monograph has two features that are especially worthy of attention. First, it provides an excellent model of how to conduct research in comparative politics. Scarrow examines four parties—the British Conservative and Labour parties and the German Christian Democratic and Social Democratic parties. For her purposes, these are probably the best parties to examine, for all are large and operate in party systems in which they must pursue vote-maximizing strategies. Second, Scarrow's focus is on how parties make use of members, rather than on how members conceive their own role, and on how that use has changed over time. (Unlike the other studies just cited, she does not make use of original survey data.) This enables her to address the much discussed argument that various changes, especially in campaign technology, have reduced the need of parties for a membership base.

Scarrow is able to demonstrate that the argument is false. The tasks that parties want members to perform have altered, but, if anything, the range of activities is broader. Furthermore, all the parties have tended to adjust the basis of their relationship with members; mediating party institutions have been replaced by more direct contact between party headquarters and individual members. This has several advantages for the former, especially in the mobilization of hitherto inactive members.

Nevertheless, although Scarrow notes that members are "valuable assets," events since the completion of her book indicate that the management of these assets may be getting more difficult. Even in parties with a strong tradition of deference by members to the decisions of the leadership, there are demands for membership input into certain aspects of party decision making. Thus, one of the serious disputes among Tories surrounding the election of the new party leader, William Hague, in 1997 was the lack of any formal role accorded to the members. In 1965, when the Conservatives abandoned their traditionally informal methods of selecting a leader, the membership neither demanded nor was given any part in the process; the matter was left to the parliamentarians, and this procedure generated no controversy within the membership at the time. The more recent experience conforms with Scarrow's conclusion that the trend has been toward a kind of intraparty democratization.

More serious still for party leaderships is the question of how to provide membership input into the setting of public policy objectives, so that members believe they really have a stake in the party, without leaving the leadership at the mercy of decisions that may make them unelectable. The problem lies not so much in possible issue-extremism among members; rather, even moderate members may take a somewhat different view of party priorities from their leaders. Thus, by the end of 1997 the Labour Party was pushing ahead with long-term plans for the greater involvement of members in discussing policy, at a time when it was becoming clear that there was considerable disquiet among members about the Labour government's policies, particularly the reduction in state benefits to single parents. Anxious to avoid the internal wrangles of earlier decades, the party had already made various moves to prevent members from embarrassing it, notably in debates at the Annual Conference; yet, it now faced a problem of how to hold members who lacked the emotional commitment to the "Labour movement" of their predecessors and who would only persist with the party if they believed it were pushing public policy in the general direction they wanted. By late 1997 there were already a number of signs of declining membership in the Labour Party.

The contrasting experiences of the German Christian Democrats and the British Conservatives suggests that the Labour Party would be right to worry about any hemorrhaging in its membership base. A really large membership is not necessary—one of the many points Scarrow makes is that successful membership parties have often not had a large base, in not the sense suggested by "mass membership party"—but a minimum level of support is required to be effective. By the early 1970s the Christian Democrats had become sufficiently worried about getting their voice heard in communities—the "spirals of silence" problem—that they embarked on membership recruitment. They returned to power within a decade. Throughout their years in government (1979–97), the Tories did nothing to reverse a membership decline that began in the early 1960s. In their heyday, the Conservatives had nearly 2 million more members than (nonunion-affiliated) members of the Labour Party, but by the late 1990s that advantage had been reduced to, at most, a few hundred thousand. Furthermore, the average age of Conservative members now exceeds 60, so that the medium term prospects for a strong membership base appear bleak.

Scarrow's conclusion, however, that "parties are transforming themselves into something quite different from the hierarchical and disciplined mass/branch parties which Duverger described" (p. 210), indicates that successful regeneration of the Conservatives may well require a significant transformation in how that party operates. In turn, as her

conclusions suggest, that will affect the entire British political process. Consequently, she is surely correct in believing that the study of membership parties remains a topic of central concern for political science; the spate of research on the subject in recent years is not a fad but a recognition of the importance for the polity of the member-leader relationship in parties.

Rituals of Conflict: Religion, Politics and Public Policy in Israel. By Ira Sharkansky. Boulder, CO: Lynne Rienner, 1996. 172p. \$49.95.

Eliezer Don-Yehiya, *Bar-Ilan University*

The stated aim of Sharkansky's book is to analyze patterns of conflict on the role of religion in Israeli politics. The author argues that the controversy over religion and state in Israel has a ritualistic nature. It is an ongoing conflict in which the parties involved seek to avoid clear-cut decisions, and neither of them achieves the upper hand. This accounts for the low intensity of confrontations in this area, while many of the problems remain unsolved. As a result, conflicts arise time and again around the same basic issues, although they appear in various forms and versions.

Sharkansky also claims that in those respects, and in others as well, Israel rather than being a unique case follows the pattern of religious politics in many other democracies. He further argues that there is a continuity in the patterns of religious conflict throughout Jewish history, from Biblical times to modern Israel.

I agree with Sharkansky's argument that the basic problems inherent in the nature of relations between religion and state in Israel remain unresolved and undecided, which does not preclude cooperation and agreements on a pragmatic basis between the contending parties. What seems more problematic is the author's claim that the religious conflict in contemporary Israel resembles conflicts on the role of religion in other democracies or in previous periods of Jewish history.

As for the first point, there is indeed a certain resemblance between the management of religious conflicts in Israel and in some of the West European countries, especially those called "consociational democracies" by Arend Lijphart. Thus, in Israel, the issue of religious education has been solved on the basis of the same "consociational" devices that served for the resolution of the "school's issue" in Belgium and the Netherlands: the allocation of governmental resources on a proportional basis to an autonomous system of religious schools. In the West European countries, however, by resolving the education problem the religious issue is no longer a major source of conflict. By contrast, in Israel there are major religion-state issues in addition to education. Several of these such as the role of religion in defining the content of Jewish national identity, cannot be resolved by resorting to the same methods employed to solve the problem of religious education. There is much to be said in this regard. Unfortunately, there is no real effort at a systematic comparison between Israel and other democratic states in Sharkansky's book.

The author devotes much more space to demonstrating his other point: the continuity in patterns of religious conflict in Jewish history. In order to prove his point, Sharkansky points to cases in the Biblical era as well as later periods, but he ignores or deemphasizes the basic differences between religious controversies within Jewish society before and after Jewish emancipation began in Western Europe in the early nineteenth century. The most notable difference is that until the beginning of the emancipation period, underlying the

various controversies was a basic consensus within Jewish society on the commitment to the traditional Halakha (Jewish religious law) as the supreme authority in all spheres of life. That consensus has been undermined in the postemancipation period, which lends the later conflicts a very different nature.

The establishment of the State of Israel has introduced another important change in the pattern of religious conflicts in Jewish society. Many issues which were once theoretical became sources of an operative political conflict with the establishment of statehood. Thus, the problem of religion and national identity has been controversial ever since the beginning of the emancipation era, but only with statehood did intense political conflict arise over the appropriate criteria for designating a person as a "Jew" in the Israeli passport.

All this does not mean to say there is no continuity between religious politics in modern Israel and earlier times, but in his efforts to stress similarities, Sharkansky does not give adequate consideration to the unique nature of religious conflict in Israeli society today. This is related to a major problem with the book. The author's stated aim is to deal with the effect of religion on politics and public policy in Israel, and this aim is manifested in the main theoretical arguments presented in the Preface. But the author does not elaborate on his theoretical points or apply them systematically by analyzing the main controversies over religion and state in contemporary Israeli society and patterns of conflict resolution in this area. Instead, he devotes considerable space to historical accounts of Jewish religion and its relationship to secular political authorities. There are many interesting points in those discussions, based on the author's interpretation of Biblical narratives and other sources of Jewish historiography and theology. Yet, those discussions are only marginally related to the author's stated aims.

There are, to be sure, chapters dealing with issues of religion and politics in contemporary Israel, and they contain interesting and illuminating accounts of confrontations between religious and secular views in the Jewish state. Instead of focusing on the "great issues," however, the author chooses to concentrate mainly on rather anecdotal incidents. Despite these reservations, Sharkansky's book is of considerable value to anyone interested in the important issue of religion and politics in Israel.

Reforming Justice in Russia, 1864–1996: Power, Culture, and the Limits of Legal Order. Edited by Peter H. Solomon, Jr. Armonk, NY, and London: M. E. Sharpe, 1997. 406p. \$82.95.

Stanislaw Pomorski, *Rutgers University*

The book under review belongs to a genre all too common in academic life: A grant was awarded (in this case two), a conference was held, participants delivered papers, the papers were edited into a publishable form, and the end result is before us in hard cover. The genre has its strengths and weaknesses. Among the strengths, I count the relative ease with which such books can be quickly created as well as their "polyphonic" perspectives on a chosen subject. Among the weaknesses typically if not invariably exhibited by such projects is the uneven quality of individual contributions, their loose correspondence to the organizing theme, and their even looser mutual interconnections. In other words, there is an ever-present danger that polyphony can degenerate into cacophony.

Reforming Justice in Russia is in many ways typical. In addition to the introductory essay by the editor, who is an

experienced researcher in Soviet legal history, there are fifteen papers written by as many authors from five different countries (Canada, France, Great Britain, Russia, and the United States, which accounts for the great majority). These are divided into three parts, each dealing with a different period of Russian history. Part one, "Varieties of Justice in Imperial Russia," has studies by William G. Wagner ("Civil Law, Individual Rights, and Judicial Activism in Late Imperial Russia"), Sergei M. Kazantsev ("The Judicial Reform of 1864 and the Procuracy in Russia"), Girish N. Bhat ("The Consensual Dimension of Late Imperial Russian Criminal Procedure: The Example of Trial by Jury"), Jane Burbank ("Legal Culture, Citizenship and Peasant Jurisprudence: Perspectives from the Early 20th Century"), and Cathy A. Frierson ("Of Red Rooster, Revenge, and the Search for Justice: Rural Arson in European Russia in the Late Imperial Era").

Part two, "Courts, Law and Soviet Power," is the largest segment of the volume. It consists of contributions by Lisa Granik ("The Trial of the *Proletarka*: Sexual Harassment Claims in the 1920's"), Golfo Alexopoulos ("Exposing Illegality and Oneself: Complaint Risk in Stalin's Russia"), Oleg V. Khlevniuk, ("The Politburo, Penal Policy, and 'Legal Reforms' in the 1930's"), Gábor T. Rittersporn ("Extra-Judicial Repression and the Courts: Their Relationship in the 1930's"), Peter H. Solomon ("The Bureaucratization of Criminal Justice under Stalin"), and Yoram Gorlizki ("Political Reform and Local Party Interventions under Krushchev").

Part three, "Justice and the Russian Transition," deals in principle with the post-Soviet period. There are papers by Eugene Huskey ("Russian Judicial Reform after Communism"), Gordon R. Smith ("The Struggle over the Procuracy"), and Sarah J. Reynolds ("Drawing upon the Past: Jury Trials in Modern Russia"). For reasons unclear to me, the editor also included in this section a paper by Todd Fogle-song dealing with the late Soviet period.

The team of contributors is dominated by historians and political scientists; academic lawyers are in a small minority. Judging by academic rank, one notices a strong presence of younger scholars. Furthermore, with so many contributors, a review cannot give a fair and full evaluation of the collection. The observations and comments offered below are not meant to be exhaustive.

The book addresses an interesting subject of immense breadth and great practical importance in view of current developments in Russia. The scope and multiplicity of contributors call for a disciplined focus on the organizing theme and, accordingly, selectivity in choosing topics of individual papers. In this regard, the volume leaves something to be desired. The crucial concept of judicial reform is never defined, let alone developed. Obviously, not every change in law, legal policy, or legal procedure deserves the name "reform." Such usage would trivialize the very concept and ultimately would render it meaningless since the universe of law constantly undergoes *some* alteration. The term should be reserved only for a fundamental change, a change having a holistic quality to it and as a rule following a blueprint developed in advance.

This lack of conceptual clarity about the organizing theme took its heaviest toll in the second part. One is at a loss to see what kind of judicial reform is to be the focus under the not particularly telling title, "Courts, Law, and Soviet Power." Are we to believe that the whole Soviet period was filled with one, continuous judicial reform? The contributions grouped here (some of them quite informative in their own right) have little to do with a judicial reform. Yet, a student of legal

reforms in Russia could find an important subject for investigation during the Soviet era: a major effort to reform Soviet administration of justice under the auspices of Krushchev, who saw it as a part of his "destalinization" campaign. Krushchevian law reform at the time generated substantial interest in the West, particularly in the United States. It certainly deserves an analysis from the perspective of the 1990s. Unfortunately, the book almost entirely ignores the subject save for one quite thoughtful paper, however limited in scope, by Yoram Gorlizki.

The quality of the contributions is very uneven. Several represent first-class academic work, to mention only the studies by Burbank, Frierson, and Reynolds; they are well researched, well reasoned, and full of original insights. My favorite in the volume is the piece by Frierson, who ably demonstrates how rural customary standards regarding arson (particularly a distinction that peasants made between "moral" arsons, as justified retaliation, and wrongful arsons) were injected into the formal process of guilt determination by Russian juries. The thoughtful article by Sarah Reynolds deals primarily with trials by jury in contemporary Russia, but she transcends her narrow subject and makes interesting observations about interconnections with reform in the 1860s. Regarding her specific subject, Reynolds convincingly argues that for now, and contrary to high expectations, the institution of jury is of marginal importance at best. The paper is partly based on empirical investigation in the Saratov region, and much more of this type of research on the administration of justice in contemporary Russia is badly needed. We need to find out what is happening "on the ground," in the provinces, at the district and regional level. Empirical work geared toward such findings appears to me much more valuable than somewhat exaggerated preoccupation with the Byzantine high politics of Moscow bureaucracies. From the bits of information contained in the book, particularly in a paper by Huskey, it appears that the Russian courts are close to catastrophe (see p. 337).

Regrettably, several contributions to the volume are quite pedestrian, flatly descriptive. Furthermore, I had difficulty grasping the essence of the "consensual dimension" of late imperial criminal procedure suggested by Bhat. He claims that "consensualism" was a uniquely Russian feature of criminal procedure. In support of his theory, he points to such characteristics as presentation of evidence by the presiding judge, the limited role played by the parties, the restrained style of the prosecutor, the right of the defendant to comment on individual pieces of evidence, and the somewhat informal atmosphere of the trial, allowing for a relatively free dialogue among the participants (pp. 67, 74, 75, 77). I can discern in those characteristics nothing "consensual," since defendants often contested their guilt and the cases were decided not by agreements between the opposing parties but by verdicts of an independent adjudicator. Nor were these arrangements uniquely Russian; they can be found at the core of continental European criminal procedure, as may be readily discerned by examining basic comparative law literature on the subject. (See, for example, John H. Langbein, *Comparative Criminal Procedure: Germany*, 1977.)

On balance, despite its weaknesses, the book makes a useful contribution to our knowledge about the administration of justice in Russia, old and new. The contribution would have been even greater with a better focus on the key concept of judicial reform and a stronger empirical orientation on the current postcommunist period.

Democracy without Equity: Failures of Reform in Brazil. By Kurt Weyland. Pittsburgh: University of Pittsburgh Press, 1996. 293p. \$44.95 cloth, \$22.95 paper.

Peter R. Kingstone, *University of Vermont*

During the 1990s, scholars have become increasingly skeptical of the prospects for consolidation and deepening of democracy in Latin America. In particular, they have observed that the new democracies there appear to be hybrids that have grafted authoritarian and/or clientelist institutions onto democratic ones. This literature has provided ample and persuasive empirical evidence to support skepticism. Yet, as Guillermo O'Donnell has noted ("Illusions about Consolidation," in *Consolidating the Third Wave Democracies*, ed. Larry Diamond et al., 1997, p. 45), the causal processes at work in these new democracies have been undertheorized.

Kurt Weyland makes a valuable contribution to understanding this problem. He asks what accounts for the virtual absence of redistributive reform in Brazil. He notes that he frequent response—elites have managed to retain their power—is an accurate description, but "it remains unclear why and how elites could hang on to their power, despite a profound revamping of the rules of the political game" (p. 3).

By treating democracy as an independent variable, Weyland is able to assess how and to what extent the regime change affected redistribution. To make his case, Weyland traces reform efforts in three areas: tax policy, social security, and health care. The empirical analysis covers the authoritarian administration of General Ernesto Geisel (1974–79) as well as democratic presidents José Sarney (1985–90), Fernando Collor (1990–92), and Itamar Franco (1992–94).

Weyland argues that organizational fragmentation within both the state and society severely hindered reform efforts. This fragmentation promoted clientelism and segmentalism over universalism and enhanced the power of privileged groups at the expense of the poor. Weak, clientelist political parties and a factionalized civil society left the poor dependent on state-led redistribution, but reformers within the state repeatedly saw their efforts severely watered down or stymied by bureaucratic in-fighting and intense lobbying from privileged groups. As a consequence of these enduring institutional factors, Brazilian democracy has produced virtually no equity-enhancing reforms.

Weyland contrasts this "institutionalist" explanation with rational choice and socioeconomic arguments. Rational choice, Weyland argues, points to a logic of collective action that is biased against the poor in general and the rural poor in particular. Socioeconomic arguments, notably dependency theory, point to the structural limits of external dependency. In response, Weyland provides empirical evidence that contradicts the expectations of both sets of explanations. Moreover, he argues that both need to understand how enduring institutional factors frame rational incentives and filter socioeconomic limits.

Weyland seeks to bolster his argument by placing Brazilian reform failures in a broader comparative perspective. His concluding chapter offers explanations of the relative successes of equity-enhancing reforms in modern Costa Rica and Chile as compared to the rest of the region; during the populist period in Latin America as compared to the current period; and in the Western European cases as compared to the United States. Although cursory by necessity, this concluding analysis is well done and convincing. Perhaps the strongest part of this chapter is Weyland's interpretation of the populist era in Latin America. Noting that organizational fragmentation can vary over time, Weyland views this period as a window of opportunity in which organizational fragmen-

tation was still low (prior to the onset of corporatist interest organization), while clientelism was diminishing (sparked by industrialization and urbanization).

Weyland makes a good case for his institutional explanation, but the argument could have been stronger had he given more consideration to his rival explanations. He repeatedly notes that socioeconomic and rational choice explanations must be set in an institutional context, but there is no systematic consideration of the ways in which they might interact. Socioeconomic factors and strategic choices frequently appear in the empirical discussion as critical determinants of central actors' behavior, but in an *ad hoc* fashion.

For example, Weyland charts in some detail the struggles among various bureaucratic agencies over tax and social security reforms. While business lobbies played a role in this conflict, so did bureaucrats' strategic decisions about how to promote development. Thus, reformers in the 1990s under presidents Collor and Franco confronted a conflict between redistribution and enhanced competitiveness of the private sector. Similarly, the empirical discussions are laced with references to politicians' strategic choices about how to mobilize support. In dismissing his rival explanations, Weyland frames rational choice as a problem of collective action and socioeconomic factors as external dependency. Viewing them in terms of strategic choices—about mobilizing political support or promoting development—may have helped him think theoretically about how strategic considerations interact with institutions to affect equity.

Despite these concerns, this remains a strong and important book. First, Weyland provides an exemplary model for conducting qualitative research. Several things stand out in particular. The argument rises out of a dense, rich lode of empirical research, including almost 300 interviews. Weyland also takes great care to define the key concepts, from "democracy," to "redistribution," to "organizations." Finally, he has traced very carefully the possible causal links between his independent and dependent variables.

Second, Weyland has effectively problematized the task of analyzing new democracies. The abundant and growing literature on democratic consolidation and deepening has convincingly shown the importance of norms, behavior, efficacy, and equity. Now this literature needs to focus on *why* these new democracies have failed to live up to earlier, guardedly optimistic expectations. *Democracy without Equity* is a provocative and persuasive contribution.

Party vs. State in Post-1949 China: The Institutional Dilemma. By Shiping Zheng. Cambridge: Cambridge University Press, 1997. 294p. \$59.95 cloth, \$19.95 paper.

Yu-Shan Wu, *National Taiwan University*

Although area studies in general are not prone to produce grand theories, there has been no lack of analytical models in China studies. Some of the most prominent examples deal with factionalism, bureaucracy, and tendency analysis. Most of the models specify major political actors, ascertain goals pursued by the actors, and delineate rules of the game. Historical cases are then brought in for analysis through the perspectives of the models.

Shiping Zheng's book follows this tradition. Though Zheng claims to use the "neo-institutional" approach, his analytical framework boils down to a bureaucratic model, with the Chinese Communist Party and the PRC state as the two major actors. The party is defined in two ways. It is a complicated organizational structure that includes the central and provincial committees and their work departments, party

core groups in state institutions, the Politburo and its Standing Committee, and all the key members in these party units. The party is also defined in terms of its political ideology, organizational principle, and the revolutionary tradition of guerrilla warfare and mass mobilization (p. 19). The state refers to the legislative, judicial, administrative, and military institutions and those who manage them (p. 18). Unlike ordinary bureaucratic analysis, however, this book does not assume institutional interest as the goal pursued by the actors. It is claimed that, under the heavy influence of more than two decades of civil war, the Party has developed a distinct "organizational rationale and logic" (p. 255), which lent the Party easily to Mao Zedong's call for continued class struggle under the dictatorship of the proletariat. The state leans toward legislative supremacy, judicial independence, and separation of the party from the government (and the military). Thus, there are structural conflicts between the party and the state it built. Zheng disintegrates the concept of "party-state" and claims that the two are analytically separate entities. This is part one of the book.

Zheng's conceptual innovation prepares the readers for a revisit of China's post-1949 political development in parts two and three. It is emphatically demonstrated that the party's organization logic made it a superb instrument for defeating the Kuomintang government and conquering China, but the same ethos was unsuitable for the new regime to acquire lasting legitimacy and revive the economy, hence the need for state building. Once the elaborate apparatus of the state was in place, the inherent tension between the party and the state emerged, leading to various efforts by the party to attack and replace the state, and the country was thrown into chaos. After the Cultural Revolution and Mao's death, Deng Xiaoping had a golden opportunity to restore the balance between the two, but he was still under the spell of the old revolutionary mentality. His failure to separate the two entities was shown vividly in the Tiananmen incident, in which the army was brought in to fight an intraparty power struggle. China's post-1949 history is thus characterized as the playing out of the inherent tension between the party and the state, which have different organizational logic and tasks.

Zheng has made a brilliant attempt to recapture the thrust of the PRC's history, but there are conceptual and empirical problems. Conceptually, it is difficult to differentiate between the party and the state. The Chinese followed the Soviet model in setting up an elaborate system of rule that places ultimate power in the party and establishes state apparatus as an instrument for party rule. The interlocking directorates (personnel overlap), party core groups, party work departments, and jointly issued directives are the major mechanisms through which the party exercises control over the state. They are intertwined organizationally, and government officials almost by definition hold corresponding posts in parallel party committees or core groups, so it is virtually impossible to separate the one from the other. The same can be said of party-military relations. Furthermore, the frequent transfers of personnel between party and state (including the military) make separation even more difficult. This being the case, the "party versus state" perspective is bound to meet difficulties.

There are empirical problems, too. Mao is treated as the main culprit who plunged China into chaos by insisting the party take over the state's functions, starting with the Anti-Rightist Campaign of 1957. The Great Leap Forward, the purge of Peng Dehuai, the Cultural Revolution, and the Tiananmen incident are all interpreted in terms of the party usurping the state's authority. In those cases, however, one finds that the line separating persecutors and victims was not drawn between the party and the state but between the

regime and the intellectuals (the Anti-Rightist Campaign); between Mao and his critics in the military (purge of Peng); between Mao and almost all the senior leaders in the party, the government, and the military (the Cultural Revolution); and between Deng, with his conservative supporters, and the nominal party boss Zhao Ziyang (Tiananmen incident). In most of the cases, the party itself was split, and so was the state. Victims and persecutors can be found on both sides (as long as a specific leader can be discerned as either a party or a state official at all). On many occasions, it was not a case of the party usurping state power but of Mao terrorizing his comrades in both arenas. With bureaucratic boundaries blurred in those cases, a Mao-in-command model, a tendency approach, or factionalism appears more proper for analysis than the bureaucratic model provided by the book.

Even though Zheng's theoretical thrust is questionable, there are nevertheless very interesting analyses of the PRC's political development, such as a discussion of the constitutional crisis of 1989. The book also touches on a wide range of institutional issues facing the post-Deng leadership, including administrative reform in the state council, establishment of the civil service, and the change in central-provincial relations. Toward the end, the author has these words for the opposition: "By separating the state from the Party, one can discover and pursue various actual and potential institutional alternatives to the Party rule" (p. 265). This shows that disintegrating the concept of the "party-state" may be a fruitful political strategy, but it may not be a proper analytical tool for investigating the history of the PRC.

International Relations

Wars, Internal Conflicts, and Political Order: A Jewish Democracy in the Middle East. By Gad Barzilai. Albany: State University of New York Press, 1996. 301p. \$23.95.

Trial and Error: Israel's Route from War to De-escalation. By Yagil Levy. Albany: State University of New York Press, 1997. 282p. \$18.95.

Yaacov Bar-Siman-Tov, *The Hebrew University of Jerusalem*

These two new books, which probably are based on doctoral dissertations, provide unique and interesting perspectives on the linkage between Israel's policy in the Arab-Israeli conflict and its domestic politics. Both studies emphasize that behavior in external conflicts should be seen as a complex interaction between external and domestic factors. Whereas Barzilai's purpose is to explain national consensus and dissent in Israel during war and lesser conflict, Levy analyzes Israel's security policy not only as a direct and inevitable reaction to Arab hostility but also as determined by social and economic interests of different elites and groups in Israel.

Barzilai's book is the first comprehensive study of the influence of the protracted Arab-Israeli conflict on Israel's domestic politics and society. Part 1 introduces the conceptual framework. Parts 2 and 3 examine how consensus and dissent gradually developed during the Suez Campaign, the Six Day War, the War of Attrition, the Yom Kippur War, the Lebanese War, the Gulf War, and the Intifada. Part 4 presents the study's findings in comparative and theoretical perspective.

The conceptual framework, which is very briefly set forth (pp. 3-15), is the weakest part of this important book. Although it presents the concepts of consensus and dissent, some of the political dilemmas involved in the use of force, and some review of the literature, it fails to provide an innovative and comprehensive theoretical framework. Such a framework would identify the main variables and present new propositions about the interrelationships between war and consensus or dissent. This might involve, for example, the problem of acquiring consensus for war, the conditions that enable such consensus, and the strategies employed by decision makers to acquire consensus or to minimize dissent. How does consensus or dissent influence the initiation, management, and termination of war? How may consensus or dissent influence the accomplishment of war aims? How do consensus and dissent differentially matter when the aims of war are offensive or defensive? Indeed, the empirical and

the concluding chapters offer some ideas about these matters, as well as criteria for assessing consensus and dissent; but this material should have been presented in the theoretical chapter and could later have guided the examination of the case studies. In this regard, the final chapter is an excellent one that summarizes the cumulative ramifications of the Arab-Israeli conflict for Israel's politics and society, while arguing some theoretical and comparative propositions.

The choice of Israel as a crucial case study is clearly justified. As a democracy involved in a protracted conflict that has escalated into six different wars (defensive and offensive, choice and nonchoice) and into a good deal of smaller scale violence, Israel is a unique case that yields many theoretical and empirical insights. Because the characteristics of the Arab-Israeli conflict make Israel such a unique case, Barzilai provides for comparison some examples of other democracies in times of conflict and war.

Barzilai focuses both on the parliamentary plane (political parties) and the extraparliamentary plane (interest groups). This distinction enables him to discuss how wars and lesser violence have affected the development of the political regime. The wide consensus during the 1948-49, 1956, and 1967 wars, which produced the impression that wars necessarily bring about national unity, changed during the War of Attrition, the Yom Kippur War, and especially the Lebanese War. Dissent became not only more legitimate but also a serious constraint on conducting "political" or offensive war.

The book is based on extensive historical documentation, including original archival and documentary material, as well as interviews.

Levy's book is an ambitious, innovative study, a contribution to the attempt to "revise" the traditional, mainstream historical and social studies of Israel. Levy explores the interrelationships between social structure and foreign policy in Israel. His main argument is that Israel's security policy was devised not only as a direct and inevitable response to Arab states' hostility but also largely in accord with the social interests of a rising middle class composed of Western Israelis (mostly Ashkenazis). "Due to the protracted state of war, this class achieved its dominant status over other groups: Oriental Jews . . . and the minority of Palestinian citizens" (p. 23). This is, indeed, a very provocative argument that requires not only a solid conceptual framework but also clear-cut evidence.

After reviewing the flaws of international relations and statist theories in explaining states' interests and behavior, Levy presents a complicated conceptual framework that is

composed of three domains of action involving relations between the state and domestic groups. Interests and state behavior may be explained by a combination of international relations elements and state features. State policies that are motivated by realist and neorealist considerations may produce outcomes such as war or peace. These outcomes of external activities, however, affect domestic actors and shape their attitudes toward issues of war and peace; they also affect—through these actors' willingness to legitimize and be mobilized—the implementation of state policies. Whereas external developments affect, via the state, the interests of domestic groups, internal agents reciprocally affect the realities of international systems via the state. Whereas a state may use external action to reconstruct interests internally, it also may mold its international environment by using its domestic factors.

This attempt to combine different international relations theories such as realism, neorealism, and constructivism with statist theories is indeed innovative, but Levy himself admits some problems: "By integrating several schools of thought, I hope to gain in scope more than I might lose in accuracy" (p. 17). It seems that the main problem, however, is not only how to measure the role of each different theory in this "theory integration" but also the method chosen for that purpose. The analytical test for arguments, as Levy maintains, is more interpretive than empirical. Attempts to corroborate or falsify certain theoretical propositions about Israel's behavior in the Arab-Israeli conflict are based mainly on interpretation of different external and domestic developments rather than on empirical analysis of data.

Instead of case studies, Levy considers four different periods: the bellicose policy that drove internal state expansion and vice versa (1951–56); the Six Day War, which expanded the war-prone circle; the watershed years (1968–81); and from escalation to deescalation (1982–96). The rationale of this division is not sufficiently clear. Levy is right in maintaining that realist arguments may explain only part of Israel's behavior, including its shift toward peace. Political and social domestic interests also affected Israel's behavior in the Arab-Israeli conflict. He fails to demonstrate, however, how Israel's security interests were largely determined by the social interests of Ashkenazis, how the protracted state of war gave this group a dominant status over other groups and especially over oriental Jews, and how this interrelationship determined Israel's route from war to peace.

In sum, these two books offer new ideas about the need to examine both international and domestic politics in order to understand better the sources of foreign and domestic policies. The interrelationship between the two domains is crucial for understanding the foreign and domestic policies of Israel.

The Politics of Humanitarian Aid Operations. Edited by Eric A. Belgrad and Nitza Nachmias. Westport, CT: Praeger, 1997. 220p. \$59.95.

The Ethics and Politics of Humanitarian Intervention. By Stanley Hoffman, with Robert C. Johansen, James P. Sterba, and Raimo Vayrynen, contributors. Notre Dame, IN: University of Notre Dame Press, 1996. 116p. \$25.00 cloth, \$14.95 paper.

Timothy D. Sisk, *United States Institute of Peace*

The perplexing moral and practical issues raised by international intervention in deadly civil conflicts—or "complex humanitarian emergencies"—are described in these two multi-author volumes. Despite inherent ethical dilemmas and operational constraints, the contributors generally agree that

multilateral interventions should be mounted to prevent and alleviate human suffering. Neither the legal norm of state sovereignty nor the practical political challenges ought to inhibit the international community from using force to provide relief to the needy in times of civil war. Intervention is justified with both utilitarian self-interest and moral imperative arguments by various authors.

The contributors to *The Politics of Humanitarian Aid Operations* argue that efforts to mitigate suffering inevitably have political motives and consequences. Neutrality and impartiality are compromised when third parties intervene to distribute new resources in domestic conflicts. The book contains theoretical chapters on issues and concepts in international humanitarian aid, case studies of the United Nations Relief Works Agency, Rwanda and Burundi, Cambodia, the former Yugoslavia, and three concluding chapters on the prospects for future humanitarian interventions.

General Sir Michael Rose, the former commander of UN forces in Bosnia, writes a foreword that implicitly places a good deal of the blame of the UN peacekeeping failure in Bosnia on the United States: "Those countries which cried loudest over Bosnia were, in fact, the most reluctant to offer the UN actual support on the ground" (pp. x–xi). This practitioner perspective resonates in the introductory chapter by Belgrad, which explains the humanitarian operations in the twentieth century (e.g., the Marshall Plan) as a consequence of political objectives. Belgrad, in a utilitarian defense of humanitarian intervention, suggests that the international community is increasingly informed by "the understanding that human misery cannot be quarantined; that it cannot be kept at arm's length forever; that if it is not opposed there, sooner or later it will descend upon us here" (p. 10).

A chapter by Jim Whitman offers reflections on the linkages between military risk and political commitment to explain the limits of assertive multilateralism, while David Forsythe convincingly describes a nascent but growing international norm that justifies the receipt of humanitarian aid as a universal human right. Alan James, in disappointingly inaccessible prose, argues that humanitarian operations and peacekeeping for conflict management should be kept as conceptually and operationally distinct as possible.

The case study chapters describe specific aid operations. Nachmias provides a stinging critique of the UN Relief Works Agency for Palestinians, arguing that the organization should fold. Although the excesses and malfeasance of UNRWA are well known, Nachmias unfairly sets up a paper tiger by describing the 50-year-old organization as a unitary rational actor that continually seeks only its own self-preservation. Two brief essays on Rwanda and Burundi (mostly Rwanda) are written by practitioners and presented as a single case study. The first describes the efforts of Catholic Relief Services to provide aid to these deeply troubled states; the second describes Israel's unilateral operation to establish a field hospital in eastern former Zaire for Rwandan refugees. The former essay offers an interesting personal insight into the ethical challenges facing front-line nongovernmental organizations, but the latter essay is mostly a self-congratulatory account of an Israeli good deed that offers few broader insights. Janet Heiniger provides an excellent overview of the complex Cambodian intervention, and James Rudolph offers a postmortem on why the UN failed in the former Yugoslavia. Rudolph's sweeping conclusions on the inherent limitations of UN peacekeeping, however, generalize from a single (arguably anomalous) case.

The highlights of *The Politics of Humanitarian Aid Operations* are the concluding chapters. Gil Loescher provides an

informed analysis of the UN High Commission for Refugees; Thomas Weiss describes the trends toward and away from assertive humanitarian intervention during the 1990s; and Leon Gordenker integrates the essays in a concluding chapter that emphasizes the importance of coordinating the humanitarian relief and political policies of donor states and international organizations. The book includes a short but useful bibliography.

Overall, there is no unifying framework chapter; the essays do not relate at all to one another; and no rationale is provided for the selection of case studies. The volume would have been stronger if the authors had related to a common analytical framework and set of assumptions. With the absence of thematic integration, and its steep price, *The Politics of Humanitarian Aid Operations* is not a good candidate for course adoption, given the many recent offerings on multilateral intervention that cover similar terrain.

The Ethics and Politics of Humanitarian Intervention, in contrast, may make an excellent companion reader for courses on war, international relations, or ethics. The readable book offers insights into the principal issues confronting the international community in the post-Cold War era. The core of the volume is two lectures by the eminent international relations theorist Stanley A. Hoffman, delivered at the Joan B. Kroc Institute of International Peace Studies at the University of Notre Dame in 1995. The first is a general rumination on the sovereignty and the ethics of intervention, and the second offers reflections on intervention in the former Yugoslavia. The two lectures are bounded by an introductory chapter by Kroc director Raimo Vayrynen and critiques by Notre Dame scholars Robert Johansen and James Sterba, with a brief concluding response by Hoffman to Johansen's and Sterba's comments.

Hoffman deftly argues that "the contemporary challenge to sovereignty is much more profound" because "the distinction between domestic and international politics is crumbling" (p. 13). Given the erosion of the norm, and the weakening or lack of resolve by states to protect their citizens, practical ethics suggests a *jus ad interventionem* that "allows for collective intervention when a state's condition or behavior results in grave threats to other states' and peoples' peace and security, and in grave and massive violations of human rights" (p. 23). This doctrine means stronger military coercion and more assertive diplomacy should have been used earlier to prevent or end the human rights tragedies in the former Yugoslavia. A moral sense of duty should have precipitated earlier and more forceful action to end the bloodletting.

Johansen counters Hoffman's appeal for greater use of force with a more restrictive and precise justification for humanitarian intervention. He suggests a graduated set of noncoercive responses—preventive deployments, police monitoring, international tribunals, and so on—that seek to minimize the need for tough military measures. Sterba puts Hoffman's arguments in more abstract philosophical form, suggesting that Hoffman offers an essentially Kantian justification for intervention. Hoffman accepts some criticisms of his approach but repeats his rationale for aggressive military responses.

From the moral perspective, Hoffman fails to address adequately the ethical dilemmas faced by decision makers in intervening states. How certain is it that greater force can lastingly resolve a civil war, and what of the cost in military casualties? The Somalia experience suggests that overwhelming force may save lives but not end wars, and Sterba makes a good argument that it is wholly unclear whether earlier use of force would have brought enduring Serb acquiescence to an independent Bosnia. Hoffman also raises the practical

obstacles to using overwhelming force, but he does not offer much on how to overcome them. On the former Yugoslavia, Hoffman engages in the equivalent of intellectual backseat driving that oversimplifies the intricacies of decision making, for example, the difficult tension between prosecution of war criminals and clinching a negotiated settlement in Dayton. Hoffman belittles Western policymakers, in a somewhat cynical tone, without sufficiently acknowledging the countervailing pressures that worked against an earlier military response. Political will was weak on Bosnia, but the countervailing pressures (not least of which was congressional opposition to U.S. deployments) were very intense.

These volumes contribute to a burgeoning scholarly literature on multilateral international intervention, and *The Ethics and Politics of Humanitarian Intervention* relates especially well to international relations theory. Yet, the volumes suffer from three common shortcomings. First, the analysis would have been much stronger had insights from coalition theory been used to explain the conditions under which a collective international response can be mounted and sustained. The practical problem of building and sustaining an international coalition for intervention is largely overlooked. What of garnering Russian and Chinese concurrence for Chapter VII mandates in the Security Council, not to mention the support of member states from the developing world?

Second, with the exception of Weiss's essay in *The Politics of Humanitarian Aid Operations*, the contributors fail to discuss the most important U.S. foreign policy guideline on multilateral peace operations—Presidential Decision Directive 25, signed in early 1994. PDD-25 describes highly restrictive criteria for U.S. participation and support for intervention. The criteria are important not only for understanding U.S. policy but also because strict application of the guidelines stymied Security Council action in responding to the horrendous April 1994 genocide in Rwanda. The choice not to intervene in Rwanda—justified mostly in PDD-25's neorealist terms—was a bellwether decision that Madeleine Albright, who was then U.S. Permanent Representative to the United Nations, subsequently admits was mistaken. With such a glaring omission of the most important U.S. foreign policy criteria on humanitarian intervention, those seeking direct relevance to current policy debates will find the lofty analysis in these edited volumes poorly informed.

The third common shortcoming is that the authors often fail to take into sufficient account the political calculus of the parties. If humanitarian intervention is akin to medical treatment for the critical illness of a state, then these volumes describe the physicians' ethical challenges and practical limitations quite well. But they do not adequately address whether and how the patient's fundamental maladies can be diagnosed and healed. Insights from comparative politics can help. Recent work on civil war termination (e.g., Roy Licklider, *Stopping the Killing*, 1993) and domestic-international interactions (e.g., Michael E. Brown, ed., *The International Dimensions of Internal Conflict*, 1996) provide these all-important, inside-out perspectives.

The New Realism: Perspectives on Multilateralism and World Order. Edited by Robert W. Cox. New York: St. Martin's/United Nations University Press, 1997. 275p. \$55.00.

David Skidmore, *Drake University*

This book is one in a series of publications produced under the auspices of a wide-ranging program on the future of multilateralism sponsored by the United Nations University

from 1991 to 1995. According to program coordinator and volume editor Robert Cox, the project's principal aim was to explore the prospects for creating "a new multilateralism built from the bottom up on the foundations of a broadly participative global society" (p. vii).

Cox contrasts the "structural-critical" approach adopted by contributors to the present volume with the "problem-solving" theories that dominate mainstream studies of multilateralism. Scholars working in the regime theory tradition implicitly adopt a normative preference for the status quo while seeking to resolve the short-term coordination problems faced by national authorities in the management of multilateral cooperation. Cox and his fellow contributors to *The New Realism* instead prefer a more critical stance toward existing multilateral institutions and focus on the conditions that might allow for long-term structural change in the direction of a more just and democratic world order.

The book is organized into three parts. Part I, "Realities," explores the underlying structural trends that are driving the evolution of multilateralism in the present world order. Three of the four essays in this section complement one another nicely. Collectively, these contributions examine the declining competence of the modern state as the central manager of social, political, and economic life. As territoriality becomes an increasingly tenuous foundation for political authority, states face growing challenges from an increasingly diverse array of social forces.

Susan Strange notes that economic globalization has enhanced the bargaining power of internationally mobile capital vis-à-vis state authorities while also complicating the task of managing increasingly integrated national economies. These realities have compelled states to cede growing authority to nonstate actors, including transnational business firms, intergovernmental organizations, and professional associations.

This reshuffling of authority relations takes place, however, within what Cox later refers to as a "dominant transnational class" (p. 247). The diffusion of power away from traditional states in favor of actors and institutions that can better perform certain system-maintaining functions poses no fundamental threat to the hierarchies of privilege that characterize the existing international order. Multilateral institutions may gain autonomy at the expense of states, but the international system remains firmly controlled by elite interests.

Yet, as Rodolfo Stavenhagen points out, globalization also gives rise to an array of antisystemic forces that could eventually provide the basis for a more genuinely bottom-up vision of multilateralism. Stavenhagen posits the emergence of a nascent grassroots civil society at the global level. As capital has become more mobile, popular forces have likewise been compelled to seek alliances beyond existing national borders. Transnational social movements have begun to cohere around issues such as environmental decay, human rights, labor conditions, the status of indigenous peoples and alternative development. Although it would be wishful thinking, as Stavenhagen recognizes, to suppose that these popular movements yet have the power or organization to overturn the institutions of the present international order, their very existence suggests that top-down models of globalization will not go unchallenged.

Rounding out this group of essays, James Rosenau explores the dialectic between globalizing and localizing forces in the contemporary international system. The latter include ethnic, religious, familial, and other subnational groups who seek to obtain a greater degree of autonomy or control over their lives from outside forces. Rosenau speculates about

whether both globalizing and localizing tendencies may derive from common microfoundations. More concretely, he argues that both sets of forces challenge the authority of the nation-state in favor of some sort of alternative "imagined community" (p. 63), whether subnational, supranational, or transnational in scope.

Together, these three articles highlight the fragility of the existing state system and suggest the possibility of a stronger and less state-centric multilateralism in the future. As some scholars have suggested, perhaps the world is moving toward a multilevel polity in which authority is parceled out more on the basis of functional specialization than territoriality. What these contributions underline, however, is that the character of any restructured multilateral order will be hotly contested among three sets of forces: top-down globalizers, bottom-up globalizers, and localizers.

Cutting across all three of these categories are gender cleavages. V. Spike Peterson's contribution to Part I provides a valuable overview of how gender discrimination remains built into the very fabric of political and economic life in modern societies. Yet, neither Peterson nor the other authors adequately explore how gender issues can be successfully integrated with the models of globalization and multilateralism discussed elsewhere in the book.

Part II, "Perspectives," examines how various non-Western cultural traditions approach the topic of multilateralism. Separate chapters discuss Islamic (Hassan Hanafi), Indian (Satish Chandra), and Chinese (Hongying Wang) perspectives. All three offer rich accounts of how the intellectual traditions of each civilization have regarded cooperation across political and cultural boundaries. In refreshing contrast with some recent works, these authors resist the temptation to treat civilization clusters as homogeneous and unchanging wholes. Instead, these essays emphasize the intellectual diversity within each culture and the important role that interactions among distinct civilizations have played in the evolution of each.

In comparing civilizations, two important common patterns stand out. In each civilization, including the West, centralizing and monist tendencies compete with decentralizing and pluralistic tendencies. Centralizing forces often gain the upper hand during periods when members of a civilization face severe competition or threat posed by outside forces. A second cleavage common to each of these civilizations pits realists, who tend to adopt a pragmatic approach to dealing with outsiders, against idealists, who typically defend visions of cultural purity against perceived threats of contamination.

Given these variations within each cultural complex, it is clear that attitudes toward multilateral cooperation are nowhere constant or monolithic. Each civilization has passed through periods of greater openness and others of greater closure. Rather than blanket generalizations, it is necessary to undertake detailed study of the conditions under which different cultures either embrace or resist multilateralism.

Part II also contains perhaps the most original essay in the volume. Kinshadé Mushakoji explores the relationship between multiculturalism and multilateralism. The global hegemony of the Western world over the past century and more has shaped the boundaries of legitimate political discourse worldwide. The institutional forms of the modern European state have been universally adopted or imposed throughout the postcolonial world. The language of modern political and economic life revolves around rational-formal concepts such as sovereignty, the market, development, progress, nationalism, and human rights. The design, procedures, and language of existing multilateral organizations reflect these same char-

acteristics. Western discourse is treated as universal and timeless.

Mushakoji argues that the triumph of rational-formalism, itself a by-product of the Western-sponsored modernization process, has "occulted" or hidden the survival of traditional ways of thinking and acting in much of the non-Western world. At the overt level, traditional thought and language are disparaged and treated as illegitimate. Yet, beneath the veneer of modernization, many people continue to find that traditional discourses make better sense of the substantive realities that shape their lives. The result is a yawning gap between the formal principles of political life and the tradition-guided practices of ostensibly modern institutions.

This gap between universalistic forms and culturally pluralistic realities hampers the effectiveness of existing multilateral institutions. A consensual facade glosses over substantive differences and promotes miscommunication. Peacekeeping operations or development projects that neglect "occulted" realities are doomed to failure. Mushakoji calls for a multilateralism that acknowledges not only a "pluralism of interests" but also a "multicultural pluralism of values" (p. 246). This would require that previously marginalized discourses be accorded legitimacy and a voice.

Part III, "Dynamics," is mostly disappointing. Chapters on the U.S. relationship to the United Nations (Harold Jacobson), multilateralism and the former Soviet bloc (Mihály Simai), and Africa (Fantu Cheru) are unremarkable. Bjorn Hettne's chapter on regional responses to globalization does, however, merit comment. Hettne discusses the various motivations and forms that comprise recent movements toward regional integration and cooperation. He contends that some forms of regionalism offer a reasonable middle ground between the limitations of the nation-state as an economic unit and the homogenizing and undemocratic characteristics of an unfettered global market economy. His preferred brand of regionalism would center around a "benign" mercantilism designed to preserve a degree of diversity and autonomy among groups of like-minded nations.

Robert Cox's conclusion focuses on the social polarizing consequences of globalization. A new multilateralism is needed that can steer this process toward more just and democratic outcomes. Cox is pessimistic about efforts to restructure existing multilateral institutions through piecemeal reform. Instead, he argues that a reconfigured multilateral order will follow the ripening of popular mobilization and the creation of a genuinely grassroots civil society at the global level.

It is perhaps this insistence on radical restructuring rather than incremental reform that explains the volume's strange neglect of existing multilateral institutions and the struggles that surround them. Popular movements have shown a surprising ability to shame or pressure governments, international organizations, and large corporations into embracing progressive multilateral initiatives in recent years. The global treaty banning landmines, the World Bank's shift toward "greener" lending policies, the spread of microbanks that provide credit to the poor, and the public pledges by several high-profile corporations to renounce reliance upon child labor and Third World sweatshops are all products of an increasingly effective grassroots style of transnational politics. Pitched at a higher level of abstraction, much of the volume (excepting Stavenhagen's brief chapter) fails to analyze the lessons and implications of these hopeful instances of bottom-up transformation.

The chief value of this volume is that it reflects a welcome emphasis on social forces, rather than the distribution of state power or institutional structure, as the principal determinants of future multilateralism. Mainstream inquiries typically seek

to explain variation in the *degree* of multilateral cooperation or the *efficiency* of international institutions. Cox and his colleagues instead focus on the *content* of multilateralism, or, in other words, the particular purposes, interests and values served by multilateral institutions and practices. While problem-solving theories emphasize *quantitative* measures of cooperation, a structural-critical approach steers attention toward the *qualitative* features of a given international order.

Still, *The New Realism* suffers from a number of unresolved tensions. While some authors, such as Cox, stress materialist factors, others, such as Mushakoji, accent ideational factors, such as cultural values and beliefs. It is left unclear how these fundamentally differing perspectives can be stitched together. A number of contributors extol the need for a more multicultural form of multilateralism. Yet, this raises the question of whether the enshrinement of cultural diversity means abandoning the search for common values and universal rights across civilizations.

The book's most puzzling feature is its title. Few of the contributors could rightfully be termed realists, old or new. Cox himself is more an intellectual descendent of Gramsci than of Morgenthau. If labels matter, then *The New Realism* is an inexplicably misleading choice.

These complaints aside, the book as a whole makes a welcome contribution to our understanding of the long-term forces shaping the future of multilateralism. *The New Realism* raises questions too often ignored in mainstream research and several of its contributors offer fresh insights that deserve further thought and research.

Shadows in the Forest: Japan and the Politics of Timber in Southeast Asia. By Peter Dauvergne. Cambridge, MA: MIT Press, 1997. 308p. \$45.00 cloth, \$22.00 paper.

David M. Potter, *Northern Kentucky University*

Peter Dauvergne examines the problem of unsustainable environmental policies in Southeast Asia by exploring the link between domestic and economic forces in developing states and the international demand for tropical timber that drives environmentally unsound forestry practices. Specifically, he examines Japanese consumption and trading practices and how they affect timber policies in Indonesia, Malaysia, and the Philippines. Dauvergne develops the twin frameworks of shadow ecology and patron-client networks to explore that link. By shadow ecology, a term coined by Jim MacNeill, Peter Winsemius, and Taiyo Yakushiji (*Beyond Interdependence: the Meeting of the World Economy and the Earth's Ecology*, 1991), Dauvergne means "the aggregate environmental impact on resources outside [a country's] territory of government practices, especially official development assistance (ODA); corporate conduct, investment and technology transfers; and trade, including consumption, export and consumer prices, and import tariffs" (pp. 2-3). He focuses on timber extraction in this case. Dauvergne contends that Japan's shadow ecology of timber in Southeast Asia has had indirect effects on unsustainable forestry by providing the demand that drives local patronage networks to exploit forestry resources. He places blame in particular on Japanese sogo shosha (general trading companies), which depend on large volumes of inexpensive log imports to stay in business. Sogo shosha were instrumental in the overlogging of the Philippines, legal and illegal, in the 1950s and 1960s. When cheap timber stocks ran out, they moved on to Indonesia in the 1970s, then to Malaysia in the 1980s. Japan's foreign aid fostered timber extraction efforts through the

1980s. In the 1990s that aid has largely been given the task of inadequate support for reforestation of degraded sites.

Dauvergne makes it clear that this would not have happened without favorable policies in the host countries. He suggests two refinements to Joel Migdal's idea (*Strong Societies and Weak States*, 1988) by arguing that states may be strong in some policy areas (limiting foreign control over natural resources) but weak in others (management of environmental resources). Timber management suffers in both cases: Strong state policies reinforce unsustainable extraction, while weak enforcement of environmental protection policies hinders timber management. The key to understanding this divergence in state capabilities lies in the structure of patron-client networks, ubiquitous in the Southeast Asian countries under study and especially harmful to sustainable timber management. Powerful patrons or their clients reap substantial rents (in all three cases the government lays claim to forest areas) by destructive timber extraction. Timber management bureaucrats at middle and low levels cannot control the devastation. In many cases underpaid officials are bribed to look the other way; in a few instances they are clients of the patronage networks that depend on resource extraction to maintain themselves.

This work undertakes the laudable task of linking developed countries' consumption practices with production in developing nations. By connecting Japan with its timber-producing neighbors, Dauvergne puts environmental resource management into a broader context. Yet, this same focus is the major problem with the book. The links between the two are never effectively made. The subtitle is something of a misnomer, since the work is mainly about Southeast Asian patronage networks and their effects on forestry practices. The opening chapter on Japanese official and corporate environmental policies is much less nuanced than the later chapters on Indonesia, Malaysia, and the Philippines. Japanese policy and practice in the latter chapters are tacked on to the preceding discussions of clientelism in each country, with often superficial discussion of the links between the two. Remedying this deficiency would have made the work longer but more significant.

The book raises two issues, one methodological and the other theoretical, which the author does not confront. The first has to do with measurement. At a number of points, Dauvergne cites nongovernmental organization (NGO) estimates of volume and rate of timber extraction in Indonesia, Malaysia, and the Philippines, typically as counters to official or corporate estimates. Here, it seems to me, we have a problem of reliability in measurement. While the author clearly finds NGO estimates more reliable than official estimates, especially in Indonesia, how do we know they are accurate? NGOs tend to lack resources that states have to carry out statistical studies, and even official estimates in developing countries are notoriously unreliable. Dauvergne tends to assume that NGOs have less reason than governments or cronies to cook their figures, but this may not be the case. The author points out in chapter 5 (pp. 156, 163) that a number of Philippine "NGOs" which have availed themselves of government reforestation funds have been front organizations for rent-seeking timber operators. In the end, we are left with two sets of data, neither of which may be accurate. This is not simply a problem of specific cases; Dauvergne asserts that an essential element of Japan's ecological shadow in Southeast Asia is the consistent undervaluation of the environmental effects of deforestation. With unreliable statistics, there is no way to make a convincing argument in that direction.

The second issue involves the effects of patron-client networks on logging incentives. The middle chapters of the

book treat patron-client relationships in each Southeast Asian case in great detail. Dauvergne implies, but does not clearly state, a theoretically interesting link between the independent variable of structure of patronage network and the dependent variable of timber extraction. The author describes two kinds of patronage networks: volatile, unstable networks centered on electoral systems and fluid parties (Malaysia, the Philippines before and after martial law) and relatively stable centralized networks in authoritarian political systems (Indonesia under Suharto, the Philippines under Marcos). The author asserts that in the first kind of patron-client system timber concessionaires have incentives to extract resources as fast as possible regardless of environmental damage, before their patrons are voted out of office and they lose their license. He makes essentially the same argument, however, about the centralized networks created under Suharto and Marcos. If there is no difference, then why all the detail about network structure? If there is a difference, the author has missed the opportunity for a key insight into politics and policy in clientelist states in general.

Its weaknesses aside, *Shadows in the Forest* contributes much to our understanding of an increasingly contentious and problematic issue both in domestic economic development and international politics. Scholars of environmental policy, Japanese and Asian political economy, and comparative politics of developing societies will find much useful material.

Bridging the Mexican Border: Transforming Mexico-U.S. Relations. Edited by Rodolfo O. de la Garza and Jesus Velasco. New York: Rowman & Littlefield, 1997. 208p. \$65.00 cloth, \$24.95 paper.

Robert A. Pastor, *Emory University*

From the second to the last decade of the 20th century—from the Mexican Revolution to NAFTA—the relationship between Mexico and its northern neighbor was distant and often difficult. Fearful that closer relations would be suffocating, the Mexican government chose to defend its sovereignty by insisting on "limits to friendship." Some Mexicans, like Jorge G. Castañeda, urged a more activist approach in order to influence U.S. policy, but such recommendations were ignored. Until President Salinas and NAFTA.

In spring 1990, Carlos Salinas proposed a free-trade agreement and reversed traditional Mexican policy toward the United States. He judged that Mexico's future depended on guaranteed access to the U.S. market and that an assertive policy by Mexico was needed to advance its interests. The volume edited by Rodolfo de la Garza, professor of government at the University of Texas at Austin, and Jesus Velasco, professor at the Center for Economics Research and Training (CIDE) in Mexico City, explains the new Mexican foreign policy and its implications for the relationship.

One of the great scholars of the Mexican Revolution, Alan Knight, introduces the subject by describing how the event gave Mexico a sense of cultural and national confidence that is rare among developing nations. The United States also learned something valuable as a result of the revolution: Military intervention against Mexico is costly and ineffective. Since then, the two countries have been careful to avoid military confrontation and, indeed, have established an interesting "congruence" in their political systems. Lázaro Cárdenas and Franklin Roosevelt both believed in the need for state intervention to cope with the economic crisis; their successors in the 1950s were staunchly anti-Communist and probusiness; López Mateos and John Kennedy were moder-

ately liberal; and, of course, George Bush, Carlos Salinas, Bill Clinton, and Ernesto Zedillo are all Ivy League graduates.

Knight is too wise to stretch the point too tightly, but his thesis is both novel and convincing. The congruence is not due to mimicry but to similar challenges that the two countries have faced at roughly the same time. Each can afford to be somewhat similar because their differences are both more transparent and profound, and each has developed a grudging respect for those differences and an appreciation of the advantages of integration.

In the post-Cold War world, Mexico has employed a new set of foreign policy tools to address the new challenge of integration. These range from lobbying in Washington to inviting "international visitors" to observe the Mexican elections in 1994. The use of the new tools, Jorge Chabat writes, "marked the beginning of the end of the discourse of 'sovereign democracy'" (p. 43).

In February 1990, President Salinas decided to strengthen the 40 consulates in the United States and establish the Program for Mexican Communities Living in Foreign Countries (PMCLFC) to enhance the Mexican government's capacity to influence the United States. The initiatives did help Mexico learn more about the Mexican-American communities in the United States, but as Rodolfo de la Garza demonstrates in his astute analysis of the PMCLFC, the more compelling lesson was that the interests of Mexico and of Mexican Americans did not coincide on a great many issues. On three out of the four most important immigration issues, the Mexican-American community defined its interests differently from that of Mexico. Carlos Gonzalez Gutierrez confirms that "had it not been for the discriminatory fervor of the initiative's sympathizers, Mexican American voters would have approved Proposition 187 [in California to prevent services for undocumented workers] by an ample margin" (p. 60).

In a well-researched essay, Todd Eisenstadt surveys the spectacular growth of Mexican government expenditures for lobbying in Washington—from less than \$70,000 in 1985 to \$16 million in 1993 (p. 94). Jesus Velasco shows how Mexico also tried to buy influence through its support for key "think tanks" in Washington. Still, both authors believe that congressional votes on NAFTA were influenced more by constituent pressures and the president than by Mexican lobbying, and Eisenstadt documents 19 separate deals that the Clinton administration made with 51 members of Congress to secure their votes.

In a concluding essay aimed at trying to weave the various contributions together, Jorge Dominguez uses three models to explain different levels of the relationship. A state-based model explains the coexistence between the two governments. The most profound changes in the relationship, however, are due to accelerating social integration by immigration and education, and he applies a society-based model for that. Finally, new institutions, like NAFTA, and functional government agencies, like the trade ministries and drug agencies, have assumed greater importance than even the foreign ministries. Dominguez makes a persuasive case that the contemporary relationship can only be fully understood by reference to the three models.

What had been a silent, barely noticeable integration between Mexico and the United States a few decades ago has become loud and momentous. The two countries together with Canada have embarked on an uncharacteristically intimate relationship that involves new costs and vulnerabilities. De la Garza and Velasco have done a great service in assembling a group of such able scholars to explore one new dimension of that relationship—Mexico's increasing efforts to influence the United States.

Some in the United States may be uneasy about the new Mexican activism; that, of course, was Mexico's historical reaction to U.S. activism. But the more both countries understand that the door between them can swing both ways, the better they will be able to benefit from integration and cope with its costs. *Bridging the Border* is a well-written and valuable contribution to understanding the changing phenomenon of U.S.-Mexican relations.

Power Steering: Global Automakers and the Transformation of Rural Communities. By Michele M. Hoyman. Lawrence: University Press of Kansas, 1997. 262p. \$35.00 cloth, \$17.75 paper.

Capital beyond Borders: States and Firms in the Auto Industry, 1960–1994. By Kenneth P. Thomas. New York: St. Martin's, 1997. 191p. \$55.00.

Richard Florida, *Carnegie Mellon University*

Multinational firms are increasingly powerful actors in the world economy, affecting state strategy and economic policy in numerous ways. Their ability to move capital and factories across borders has placed enormous pressure on governments—at all levels—to create ever more attractive "business climates," to provide ever more generous incentive packages, and to engage in costly bidding wars to lure multinational factories inside their borders. Nowhere is this more apparent than the automotive industry, as governments around the world vie to attract new assembly factories in the hope of creating jobs and spurring economic development. Two new books by political scientists tackle important dimensions of this subject.

Capital beyond Borders, by Kenneth P. Thomas of the University of Missouri in St. Louis, examines the effects of increased capital mobility in the automotive industry on nation-state behavior over the post-World War II period. Building on themes originally outlined by Charles Kindleberger, Raymond Vernon, and Robert Gilpin, among others, Thomas makes two related arguments: Capital mobility in the automotive industry has increased substantially over time, and this, in turn, has substantially altered the balance of power between multinational firms and nation-states in favor of the former. Thomas contends that the ability to relocate plants around the globe has increased the bargaining power of multinational enterprises vis-à-vis states along several key dimensions: by substantially expanding the locational options available to firms, by enabling them to consider a wider range of possible investment locations (thus eroding the bargaining power of states), and by introducing powerful bidding dynamics into state strategy. Thomas focuses, specifically, on the use of investment incentives by governments and escalating bidding wars among states as evidence that the balance of power in international political-economic affairs has shifted away from states and toward multinational firms.

In developing his argument, Thomas provides a comprehensive synthesis of the broad and diverse literature on this subject—for this alone the book is worthwhile. He then analyzes a variety of statistical evidence on the global activities of leading automotive firms (particularly the American Big Three). The statistical data suggest that at least two of the Big Three have substantially expanded their global production activities since World War II. At both Ford and GM, the percentage of foreign employees (i.e., from outside the United States) has virtually doubled, growing from 30.6% in 1951 to 63.7% in 1990 at Ford, and from 30.3% in 1970 to 52.8% in 1994 at GM. Chrysler, much less global in orienta-

tion, has actually experienced some reduction in the percentage of foreign workers in its work force since the late 1970s.

The heart of the book revolves around a series of case studies of factory location decisions in the United States, Canada, and the United Kingdom, including the Diamond-Star joint venture between Chrysler and Mitsubishi in Illinois and various Big Three plants in Mexico and Canada in the context of NAFTA. These case studies probe the dynamics of corporate location, focusing on how increased corporate locational flexibility places pressure on governments to offer ever larger incentive packages both to lure firms to new places and to retain them in existing locations. The findings suggest a trend toward higher incentive packages. Thomas further argues that capital mobility simultaneously erodes the power of labor unions and workers, resulting in slower wage increases (and in some case in actual wage reductions) and the establishment of more flexible work environments.

Power Steering, by Michelle Hoyman, also of the University of Missouri at St. Louis, explores a related dimension of the effects of capital mobility on governments and public policy. She focuses on the long-run influence of major corporate location decisions on the social, economic, fiscal, cultural, and political organization of communities. Hoyman examines four new automotive assembly investments in the United States: GM's Saturn plant in Spring Hill, Tennessee; Nissan in Smyrna, Tennessee; Toyota in Georgetown, Kentucky; and Honda in Marysville, Ohio. These are among the newest, largest, and most advanced automotive assembly complexes in the United States and the world. And each is a greenfield site, located in a small rural community.

While Hoyman describes the incentive packages and bidding strategies that enabled each of these communities to land a major automotive assembly complex, she zeroes in on the effects of these factories on the surrounding community. She contends that instead of looking at plant location as a static, "one-shot" event, it can be more appropriately conceived as a broad and dynamic process of development, starting with the decision to establish a plant and moving through both short- and long-term economic development effects. To do so, she draws upon extensive primary source research, including detailed analyses of community fiscal issues, interviews with government and corporate officials, and analyses of various public opinion polls which gauge changing community sentiments.

Her findings suggest that the multinational production complexes create enormous pressures (as well as benefits) for communities. Considerable burdens are placed on local infrastructure, from roads to water treatment facilities. Revenues do not always rise in synch with soaring service and expenditure needs. World-class factories require world-class education and training infrastructure, creating more pressure for advanced school curricula and state-of-the-art vocational training programs. The neighboring communities and counties are frequently hardest hit, with escalating demands for services but little in the way of new revenue. Furthermore, Hoyman finds a disjuncture between the state government officials who actively organize these investment "deals" and their local government counterparts, who must cope with the costs. She also finds that the new complexes have a powerful effect on a community's politics and political structure, ushering in a leadership change toward progrowth coalitions and further economic development. Still, she concludes that, despite these costs, large multinational automotive assembly complexes tend to garner the support of both local leadership and the citizenry at large.

Both books are welcome and basically solid contributions to the growing debate over investment incentives and the role

of multinational firms in conditioning state behavior. Both are very well argued, and I agree with the central arguments of each. Both, however, suffer from some similar flaws.

The first set of problems is mainly conceptual. Both books pose multinational firms as relatively unconstrained actors, operating with full information and able to move capital and factories around the globe virtually at will. But other research shows that multinational enterprises are constrained by various factors, including their own organizational history and path. For example, it is very hard—and probably impossible—for Volkswagen to abandon its major assembly complex in Germany, even though it can and does produce cars far more efficiently and with far more modern work systems at other locations. Location in the automotive industry is strongly conditioned by markets, as major car makers pursue "build-where-you-sell" strategies. Both books overlook the interesting collective action problems that face both enterprises and states in the era of globalization. Stiff competition and highly imperfect information mean that multinational automotive firms frequently adopt follower strategies in emerging markets, leading to well-documented overcapacity and shaping potentially devastating shakeouts for the not-too-distant future. Due to the focus on the investment strategies of major automotive assembly companies, both books miss the even more interesting globalization of the supply sector, as a group of large international automotive component producers (such as Bosch, TRW, Johnson Controls, and Denso) consolidate their hold on the market, drive out or acquire smaller domestic suppliers, and develop an integrated multinational supply infrastructure from which all major automotive assemblers draw.

Furthermore, both books overlook the potential countervailing strategies of states. The centrality of markets in attracting automotive investments affords substantial power to large states, such as China, to extract concessions from multinational firms in the form of joint ventures with and technology transfer to national enterprises. Simply put, the relationship between multinational enterprise and states is not unidimensional: Indeed, states differ substantially in the degree of leverage they possess in bargaining situations with multinationals. And, surprisingly, both books disregard the potential for states to engage in collective action strategies (as some are already doing) to limit the bargaining power of multinational enterprises, through agreements to confine the use of investment incentives.

The second set of problems involves methods and research design. Both books rely on limited and to some extent biased samples. While the authors establish the plausibility of their arguments (which is very useful and valuable in and of itself), they fail to produce the kinds of evidence required to prove those arguments and hypotheses in ways that are externally valid. *Capital beyond Borders* relies on a very limited sample of case studies drawn from Big Three plants located in just three advanced nations. To really nail down its case, this book would require a broader sample of firms and locations, including Japanese and European automotive companies and locations in continental Europe, Asia, and South America. *Power Steering* depends on a limited sample of four large assembly complexes located in four small, rural communities. A broader sample of complexes of various sizes located in large and small urban and rural communities would be required to substantiate many of its claims.

Still, these are minor quibbles with books that are useful and valuable additions to the growing literature on the effects of globalization on politics, political organization, and public policy in the automotive industry.

When all is said and done, there remains little doubt that

the outward investment activities of multinational enterprises have spurred widespread economic growth and development both in the emerging economies and in formerly "written-off" industrial regions of the United Kingdom and the United States as well. Thus, it should come as little surprise that governments have unflinchingly embraced corporate investment as a core strategy for economic growth and development. For the time being, multinational firms are clearly in the driver's seat, but a backlash may well be waiting in the wings. In any event, it will take time for states to develop the right mix of strategies to cope with increased multinational investment in this newest era of globalization.

A Paradigm for the New World Order: A Schools of Thought Analysis of American Foreign Policy in the Post-Cold-War Era. John C. Hulsman. New York: St. Martin's, 1997. 212p. \$65.00.

Mary Durfee, *Michigan Technological University*

John C. Hulsman has written about a very difficult subject—how ideas about the international system help decision makers make sense of their policy choices and how collections of these ideas may play out in bureaucratic politics. In an effort to make these complex, nested links he combines ideas, people, and bureaucracies together into three "schools of thought," each of which begins with first principles as to what helps produce international peace. From the principles, he deduces the policies American decision makers would advance for different issues and regions. He then uses the schools to explain the course of Clinton's policy toward Bosnia through the Dayton Peace Accords.

Unfortunately, the links do not hold, or at least they are unconvincing in the face of the evidence. First, the schools-of-thought concept itself proves definitionally slippery. It is smaller than an ideology because it does not transform individual belief systems into collective belief systems (p. 10). It is somewhat larger than Ole Holsti's notion of a belief system, because the priority setting of an individual belief system goes on at "a higher analytical plane" (p. 10). Second, the underlying principles of the schools seem to need clear domestic "first principles" to match the international ones. Third, while Hulsman says that only elites occupying bureaucratic roles (he includes the Senate here) share and contest over schools of thought, public opinion can nevertheless influence those elites. Last, the schools are so flexible that leaders and policies can readily change in the face of domestic or international events, and thus one wonders what stability they provide.

The three schools of thought Hulsman identifies are democratists, neorealists, and institutionalists. As first principles, Democratists dream of a peaceful world of democracies; neorealists imagine the world in zero-sum or relative gains terms, and institutionalists emphasize absolute gains from trade and interdependence. He summarizes all this as follows. "Shared interests is the catchphrase for institutionalists, just as shared values is a crucial notion for democratists, and national interests is an essential thought underpinning neo-realism" (p. 66). Even though Hulsman says it is crucial to understand first principles, his actual sorting of individuals and policies relies on orientations to European allies and to Russia (and China, though he provides no case evidence). Logically, this should make sense, providing one has the right first principles and can show that they, rather than the immediate logic of events, really do structure the regional policy preferences.

A convincing connection between first principles and re-

gional policy stands, however, is not made. Hulsman places nine individuals into the three schools according to their views on regional issues. He writes of Secretary of Defense William Perry: "His neorealist gives lead to, paradoxically, institutionalist policy outputs" (p. 97). Perry thought Bosnia was not important enough for intervention (as did the neorealists), but he also opposed lifting the embargo, an institutionalist stand. Nor does use of a more abstract bridging concept, like multilateral or unilateral action, help clarify the schools. All three schools prefer multilateral action over unilateral, but they differ in degree. Perhaps if the case material had gone beyond the Bosnia problem—for example, trade issues—it would have been easier to imagine how the nuances in regionalism and multilateralism help explain policy outcomes.

In the end, the schools are so susceptible to changing events that pragmatism seems a more robust concept than schools. It would help the schools concept enormously if Hulsman thought more about pragmatism and compromise. For example, he notes that a change from "passive," "static," and "reactive" institutionalism (he uses these words interchangeably) to a "muscular" institutionalism (p. 169) was caused by three alarms: the massacres at "Srebrenica, European pressure to leave Bosnia and Congressional hostility to the arms embargo" (p. 169). The situation changed, and with it the "institutionalist" interest in sanctions and the U.N. as the way to solve the problem. These events opened opportunities to change policy, to reassert other policy preferences both within the foreign policy establishment and between the United States and the allies and Russia. The schools do not help explain this change, because they say nothing about the openness of the schools to compromise or new information.

Even more problematic is the importance Hulsman gives to domestic factors in shaping the schools; yet, his schools have no domestic logic to them, which causes endless problems in making the tie to bureaucracy and politics. For example, the reason the president can sometimes get his way is because the neorealists (like Dole) believe that the executive should be strong (p. 173). Yet, this key element in explaining outcomes is not discussed as an important part of the neorealist school. The problem of compromise appears again, this time with another branch of government. "With his institutionalist Bosnia policy so unpopular both with the public and the neo-realist Congress [after the 1994 elections], the President was forced to compromise, even during negotiations regarding the [Dayton] treaty, adopting some neo-realist planks in the accord so that the package stood a chance of receiving congressional approval" (p. 179). By this logic, the president might have become a neorealist had the Republicans done even better in the 1994 election. As it was, the margins of electoral victory were too slim in Congress to override presidential vetoes, so this much change was not required of the administration. One needs only the U.S. Constitution to understand this domestic outcome.

Certainly, there are policy differences, and these ebb and flow in daily politics. But are they extensive enough to be called schools? How would we tell? For example, one might use a set of cases to capture more carefully the first principles of the purported schools. These cases would help readers decide whether the schools idea is more useful than simply saying "the president's policy." They would, presumably, increase the number of individuals who matter, thus giving a stronger sense of when personality as opposed to role matters. The cases could be used to tease out differences in orientation to regionalism, multilateralism, compromise, and pragmatism. The cases might also help identify the missing domestic concept the schools require. In the end, one comes

away from the book feeling that the logical framework misses important variables and bears only a tenuous relationship to the evidence.

Strategic Geography and the Changing Middle East. By Geoffrey Kemp and Robert E. Harkavy. Washington, DC: Brookings Institution Press, 1997. 493p. \$52.95 cloth, \$22.95 paper.

Aurel Braun, *University of Toronto*

We are living in a period of transition. Monumental changes have occurred in the international system with the collapse of communism and the demise of the Soviet Union, the second superpower. Instead of what many perceived as a bipolar world, we are in a transition, possibly, to multipolarity. The tense and risky confrontations of the Cold War have been transformed in some important respects into processes of cooperation and inclusion. A Russian general sits at NATO headquarters in Belgium as part of a new cooperative arrangement between the Atlantic alliance and Russia. Three former members of the Warsaw Pact have been invited to become full members of NATO. There is, therefore, a need for new thinking about the international system and about all aspects of regional conflict and cooperation.

If we are to reconceptualize, then we must focus not only on the new but also on that which is both probative and relevant. George Bush's rather inarticulate musings about a new world order hardly moved our understanding much farther. More sophisticated analyses have been provided by scholars such as Samuel Huntington ("The Clash of Civilizations," *Foreign Affairs*, Summer 1993, pp. 22-49), who has argued that the great divisions among humankind and the dominating source of conflict will be cultural. That is, a clash of civilizations will dominate global politics. Others, such as Francis Fukuyama ("The End of History?" *National Interest*, Summer 1989, pp. 3-18), have written, perhaps partly tongue in cheek, about "the end of history." But there is no definitive answer about the future. There is not even a consensus about current developments. Still, we continue to strive to understand the motor forces for change and to identify more clearly the warning signals of international danger.

In no region of the world has conflict been more endemic or interstate problems more intractable than in the Middle East. The end of the Cold War could present new opportunities to reshape that region, and yet, just as in the rest of the world, there are also enormous risks. To understand these, there is an especially urgent need for conceptual clarity and appreciation of the linkages among political, economic, and geographic factors, together with a thorough examination of the historical context. Geopolitical analysis, which emphasizes the relation of international political power to geographical setting, offers some promise, but it is usually such a broadly construed approach that, for the Middle East in particular, we likely need a more sharply defined focus. This is where Geoffrey Kemp and Robert Harkavy, two veteran analysts of the Middle East, are ideally suited to help. Both have written extensively and with distinction on the region and have worked as government advisors and policymakers. They can bridge the gap that so often exists between scholarship and policymaking. They have produced an intelligently organized and extensively researched work that makes a great contribution to our understanding not only of the Middle East but also of the workings of the international system itself. Two aspects of the book are especially noteworthy: the conceptualization and the geographic definition of the region.

Strategic geography, according to the authors, unlike geopolitics, has a more specific meaning in that "it is directed at the tactical elements of geography that contribute to grand strategy" (p. 8). Moreover, the former refers to the control of or access to special areas (land, water, and air) that have an effect, either positive or negative, on the security and economic prosperity of nations and embrace both human and physical geography. Finally, the several subcategories allow the authors great scope and opportunity. But this also makes for a remarkably ambitious undertaking that needs and seeks to explain the constant interplay of crucial factors, including physical geography, which changes slowly, and political geography (a subcategory of human geography), which can shift suddenly and dramatically.

Yet, this is an eminently sensible approach. In any particular period, but especially during one of fundamental transition, good analysis demands attention to a multiplicity of factors and the fluidity of change. Many would be daunted by the task, but Kemp and Harkavy plunge ahead. In examining the sources of conflict, they analyze the role not only of raw materials and energy but also of water. They assess not only the linkages between geography and conventional warfare but also the revolution in military affairs (RMA) that was so starkly demonstrated during the Gulf War. And they provide extremely valuable information on the status and potential use of weapons of mass destruction in the region.

In defining the region, the authors make their task even more complex. The area known as the Middle East (at least since World War II) or, according to the traditional U.S. State Department definition, the area that stretches from Morocco to Iran, encompasses a zone of almost unparalleled strife and controversy. Would the study of this area alone not be sufficiently challenging, especially given Kemp and Harkavy's complex conceptual approach? They opt instead for what they call the greater Middle East. This vast quadrilateral is bounded by the Sahara and the Mediterranean on the west; the Black Sea, Caucasus, Elburz Mountains, and Hindu Kush to the north; the plains of India to the east; and the Indian Ocean to the south. Thus, a huge part of the former Soviet Union and of India and Pakistan are encompassed. It is not hard to imagine that this would be enough to worry geographers and panic many political scientists.

Still, if one accepts the conceptual framework of the authors, there is considerable logic to this geographic expansion, despite the potential pitfalls. Religious strife, political transformation, historic enmities, the contest over resources, and the revolution in military technology are sufficiently intertwined here to allow for a reasonable geographic cohesion, at least for analytic purposes. But given the risks of lapsing into mere description and data compilation, the onus is on the authors to justify this geographic logic throughout the work. They succeed admirably. In the process they provide new and important insights into the Arab-Israeli peace process, the India-Pakistan dispute, the violence in the Caucasus, and the tribulations in the Persian Gulf.

Furthermore, Kemp and Harkavy not only cover a breathtaking range in their analysis of political, economic, and military trends but also provide both context and perspective. They suggest two disturbingly different regional scenarios: cooperation, modernization, and prosperity or instability, tension, and various conflicts. They also address in the process a variety of myths, including that of Western decline.

There may be some quibbles. Though the authors are not unsympathetic to Israel, they clearly favor the Labor Party view, and they give Mikhail Gorbachev too much credit for ending the Cold War. Overall, however, the book is admirably balanced, remarkably insightful, and clearly written. It is

a most welcome and important study of a region that is so crucial to international prosperity and security yet remains so unstable.

Interests, Institutions, and Information: Domestic Politics and International Relations. By Helen Milner. Princeton, NJ: Princeton University Press, 1997. 309p. \$47.50 cloth, \$18.95 paper.

Daniel Drezner, *University of Colorado at Boulder*

It is easy to tell an anecdote showing that domestic politics matters in international relations. It is much harder to explain in a systematic fashion how, why, and when domestic forces matter. International relations theorists have been squeamish about taking this step, in part because of the complexity of the task. What aspects of domestic politics are important? Interest groups? Institutions? Public opinion? Bureaucracy? It is not surprising that most scholars duck behind Kenneth Waltz's warning of reductionism and tread no farther.

In this ambitious book, Helen Milner enters the breach and constructs a fully developed model of the interaction between domestic and international politics to explain the pattern of international cooperation. What is truly extraordinary about Milner's approach is that it encompasses practically every facet of domestic politics without sacrificing parsimony or clarity. Milner argues that nation-states are polyarchies of institutional and societal actors, each with a distinct set of preferences. For her model, the relevant actors are the executive, the legislature, and interest groups that act as "endorsers," supplying the legislature with information about the proposed agreement if the executive withholds it. Her game consists of two parts. First, the executive and the foreign country negotiate along a unidimensional space. If an agreement is reached, the executive presents it as a take-it-or-leave-it offer to the legislature for ratification. From this beginning, Milner varies the divergence of interests between the actors, the degree of information held by each actor, and the ability of each actor to set the agenda, amend, veto, and make side payments. Milner's formal model allows her to pinpoint exactly when and how domestic politics matters. For example, a legislature that is more dovish (preferences closer to the foreign country) than the executive will have no effect on international cooperation. A hawkish legislature, by contrast, acts as a strong constraint on the terms of the final agreement.

Milner comes to three central conclusions. First, systemic approaches to international relations, including realism, have exaggerated the extent of international cooperation. Relative to the state-as-unitary-actor approach, the introduction of domestic politics never improves the chances of cooperation. As the legislature becomes more hawkish, the increasingly divided government becomes less capable of cooperating with other states. Furthermore, any agreement reached will reflect legislative rather than executive preferences. To some extent, this undercuts claims made by Thomas Schelling and Robert Putnam that a recalcitrant legislature increases the executive's bargaining power in the international arena. Second, interest groups are important not because of their ability to apply political pressure, but, consistent with McCubbins and Schwartz, because they can transmit information to uninformed actors. Contrary to most game-theoretic approaches, Milner argues that imperfect information, rather than impede cooperation, makes it more likely. Legislatures will rely on endorsers at different ends of the political spectrum to signal the content of the agreement. Thus, no

endorsements lead to rejection, whereas multiple endorsements lead to ratification. Third, changes in the ratification procedure (i.e., a popular referendum rather than a legislative vote; a supermajority rather than a majority vote) made after an agreement has been signed will scuttle the chances for ratification. Executives will negotiate an agreement to target the support of a median legislator; a change in the institutional process shifts the location of the median voter, making ratification more difficult.

Milner's approach represents a large step forward for two reasons. First, it moves beyond a plethora of rather stale debates in international relations. With one model, Milner has addressed the literatures on strong and weak states, presidential versus parliamentary systems, and the importance of societal actors versus political institutions. Her framework represents a theoretical advance because it incorporates these disputes and much more. Second, the model specifies the precise causal mechanisms through which legislative and societal actors influence foreign policy. Executives anticipate the preferences of legislators and endorsers prior to negotiating with other countries. Thus, legislators do not influence international relations through active measures but by letting leaders and interest groups do their work for them.

The flaws in this book emerge when one turns from the theoretical to the empirical chapters. Milner tests her model on four paired sets of cases. She looks at Anglo-American negotiations during the 1940s on exchange rates and trade, oil, and aviation; Franco-German negotiations on the European Coal and Steel Community and the European Defense Community; and, more recently, NAFTA and the Maastricht Treaty. I found the testing strategy unsatisfactory. On the one hand, the hypotheses are specific enough to have permitted some statistical tests. On the other hand, the case studies are incomplete and not sufficiently detailed to show the causal mechanisms at work. For example, Milner asserts that President Truman could not get the International Trade Organization charter ratified in the late 1940s because of the Republican-dominated Congress. All well and good, but she fails to explain why it did not pass when the Democrats controlled both houses of Congress during the 1948-1950 session. This is an example of the tendency to assert rather than delineate the causal evidence. The limited scope of the case studies also prevents the author from seriously assessing alternative explanations to international cooperation. Milner refers to realism and liberal institutionalism at various points, but she admits that "they are not systematically tested in this book" (p. 23). For one case, Milner dismisses the epistemic community argument with one sentence.

Although the evidence is consistent with Milner's approach, there are some puzzles that do not quite jibe with the model's assumptions or predictions. In many cases, the negotiated agreements are supported by centrists but rejected by groups on both extremes. This is inconsistent with her characterization of actors' utility functions. The problem may be that several of the issues under negotiation have more than one dimension. What is also striking is the number of times executives are able to buy off endorsers with side payments and thereby win ratification. What is surprising is why the executive fails to make these payments in cases in which agreements are not ratified. One possible explanation is that side payments are easier to make in cases of economic agreements as opposed to security agreements. An industrial lobby can be satiated with a trade exemption; a military that sees its autonomy undercut is less likely to be mollified by an increased defense budget.

The empirical problems do not undermine the strengths of this book. Milner has created an elegant and useful model of

how domestic politics affects the ability of nations to cooperate with one another. It has more sophistication and precision than any other theory of how domestic politics influences international relations. It will be the benchmark on the subject well into the next century.

The Chemical Weapons Taboo. By Richard M. Price. Ithaca and London: Cornell University Press, 1997. 233p. \$32.50.

Marie Isabelle Chevrier, *Harvard University*

I keep in my mind one picture of Saddam Hussein's gassing of his own Kurdish people—a mother curled around her child, both of them frozen in death by chemical weapons. Other images of warfare lurk there as well: victims of napalm, land mines, mortar shells, and nuclear weapons. Each weapon exacts its own horror. Yet, thus far, only chemical and biological weapons have sustained nearly universal condemnation for the past hundred years. Why these and not others? Many weapons, condemned when introduced into warfare, have gained acceptance over time. The abhorrence of chemical weapons, however, has endured.

Many authors have sought to explain the persistence of this condemnation. One line of thought posits that the human reaction to the use of chemical weapons is universal, perhaps genetic, certainly centuries old, mysterious, and maybe unexplainable. Among its roots is the ban against the poisoning of wells. In *The Chemical Weapons Taboo*, Richard M. Price has articulated an opposing position: The prohibition against the use of chemical weapons is a political construct that has evolved throughout this century, growing stronger over time, even as it has sustained some serious violations in World War I and the Iran-Iraq war. Price supports his position by tracing the political genealogy of the chemical weapons taboo from its international political birth at the Hague Conference of 1899 to the entry into force of the 1993 Chemical Weapons Convention in April 1997. In doing so, he follows the construction of the norm, the tempests that it has weathered—albeit not entirely intact—and its reinforcement following such storms.

Price does more than piece together the lineage of the taboo. In original and valuable chapters, he confronts the common understanding that the taboo was shattered by the extensive use of gas warfare during World War I and ignored by Iraq in the Gulf War. He carefully compiles evidence to build the case that in these instances the use of chemical agents in warfare was carried out in recognition of the taboo. In both instances, the users of chemical weapons did so only after a period of restraint, and then only with an explanation that attempted to justify the step. Germany claimed that it used chemical weapons in response to French use, while Iraq maintained that chemical weapons were needed to counter the Iranian "human waves" invading Iraq. Although the taboo was weakened in these two cases, the international community responded by strengthening the political and legal constraints upholding the norm.

Equally important, Price revisits effectively and thoroughly the nonuse of chemical weapons in World War II. There were a few cases of chemical weapons use in the interwar period: Italy in Ethiopia in 1935–36 and Japan in its war with China. In striking contrast to World War I, however, none of the major belligerents in World War II used chemical weapons. Price concludes that the burden of providing a justification for breaking the taboo was substantial enough to forestall the preparations necessary to undertake a chemical weapons assault and ultimately a decisive factor preventing their use. He builds a convincing case of the important role of

individual heads of state and adds flavor to his narrative by contrasting the positions of Roosevelt, an ardent opponent of chemical weapons, and Churchill, who had many fewer misgivings.

Price's inclusion of the philosophical as well as the political basis of the taboo, and its changes over time, enriches his argument and strengthens his conclusions. His depiction of the image of chemical weapons as "uncivilized" and their historic association with weakness is thought provoking and challenging. The discussion of the development of the ban on poisons is enlightening, particularly the conclusion that poison weapons somehow upset the norms of warfare as a contest of power. Poisons were deemed unacceptable because they gave a great capacity for destruction to relatively weak states. Thus, powerful countries condemned the use of poisons as an unacceptable form of warfare to avoid the risk of conflicts that would not necessarily be won with superior economic and military strength.

Price makes a major contribution to the understanding the vicissitudes of the chemical weapons taboo, but his book is marred by some weaknesses. Most important, Price sets up his explanation of the taboo, as a twentieth-century political construct, in opposition to the view that chemical weapons are a modern form of an ancient abomination, recast in different guises over time. He appropriately rejects both the essentialist argument, that the prohibition stems from the cruelty of the weapons, and the realist argument, that chemical weapons are useless militarily, as an inadequate explanation of the durability of the taboo. Price argues that diplomats at the Hague Conference viewed chemicals as different from poison. The latter weapons had a long history, but chemical weapons, he claims, were not treated as a variant or subset of poisons but as a new category. His evidence for this novel contention is intriguing, but some of his conclusions are not convincing. He does not present the evidence from both sides of this argument, weigh it in a balanced fashion, and support his conclusion in the face of evidence from both sides.

Moreover, Price's insights do not depend on separating the chemical from the poison taboo. The two theories explaining the taboo are not exclusive. It is perfectly possible to accept the validity of what Price says concerning the political construction of the chemical weapons taboo while viewing it as a cloak surrounding and protecting the time-honored poison taboo. His observation that the moral, perhaps primeval, objection to the use of poisons was not a sufficient explanation for the strength and duration of the chemical weapons taboo does not necessarily lead to the conclusion that its origins are elsewhere. Nor does the existence of the centuries-old objection to poisons, attached to the political construction now defined as the ban against the possession of chemical weapons, mean that the germ of abhorrence to poisons was absolutely necessary to the establishment of the political structure. By abandoning the poison taboo, Price is unable to evaluate the question of whether the chemical weapons taboo could have been established without its historical roots, with the implications for establishing barriers to the use or possession of other types of weapons.

Price's use of obscure words and needlessly complex sentences is likely to frustrate even erudite academics. It is almost certain to discourage the casual reader of military history from what is an otherwise fascinating look at an important subject. The purpose of academic research, particularly in the social sciences, is to make new ideas and important findings accessible to a wide audience, not simply the experts in a narrow subfield.

Despite the above reservations, Price's study of the polit-

ical history of the chemical weapons taboo in the twentieth century is an important and intelligent contribution to the field, and it is a model of interdisciplinary research covering areas of philosophy, history, political science, ethics, and security. It is likely to be an enduring record of the importance of tackling complex subjects in a forthright manner.

Global Challenges: An Approach to Environmental, Political, and Economic Problems. By Todd Sandler. New York: Cambridge University Press, 1997. 234p. \$54.95 cloth, \$16.95 paper.

Michael McGinnis, *Indiana University*

Todd Sandler uses a common set of analytical tools to analyze an unusually wide range of substantive concerns. He presents the necessary tools of game theory and public policy in a very accessible form. Throughout the book the focus remains on transnational dilemmas involving the environment (acid rain, ozone depletion, global warming, deforestation, loss of biodiversity) as well as terrorism, nuclear proliferation, and the transmission of disease. All are treated as instances of collective action in response to different forms of market failure.

The argument builds on basic justifications for government intervention in the presence of externalities, public goods, or poorly defined property rights. Since national governments jealously protect their sovereignty, some practices are not easily applicable to transnational problems. But Sandler argues that many options short of global governance are still available. His overriding theme is that many regional and global environmental problems can be solved without signing international treaties or establishing global organizations, provided the incentives are right. Once sufficiently credible information is available, he argues, most transnational problems can be resolved in one way or another.

This notion that different collective action problems call for different responses is hardly novel, so the contribution of this book must lie in the ways the author distinguishes among types of problems. Sandler provides a series of useful distinctions, each clearly illustrated with succinct descriptions of appropriate examples. Analysis quickly moves beyond such standard distinctions as the contrast between local environmental problems with immediate and easily observable consequences (such as acid rain) and problems of global scope involving longer term and uncertain consequences (such as global warming). Of particular interest is his use of maps to illustrate why European nations found it easier to cooperate on reducing sulfur emissions than nitrogen oxide, even though both are components of acid rain.

Less well-known distinctions are put to innovative uses. Sandler argues that unequal distributions of effort may facilitate production of public goods characterized by a "best-shot" production technology (such as discovering a cure for a new disease) while at the same time making it difficult to produce public goods with a "weakest link" technology (such as prophylactic measures taken to limit the spread of that disease). In the former case, levels of effort are related to the private advantages large contributors gain from development of a novel solution. In such circumstances, Sandler argues that the international community should act to reinforce or encourage unequal allocations of benefits. This (limited) celebration of inequity as a solution to some public goods provision problems is perhaps the clearest instance of his avowed intention that this book be seen as "provocative."

What I found most intriguing was Sandler's analysis of

intergenerational justice. Sandler argues that the current population of the world is, in effect, engaged in a strategic interaction with subsequent generations. The current generation has a "first-mover advantage," since it can structure the range of choices available to later generations. This second mover has less effect on the outcome than in models of contract disputes or election campaigns, but emotional ties between generations may make the first player less likely to exploit this strategic advantage (under some conditions). This example nicely illustrates the benefits of forcing theory and substance to interact on a sustained basis; after reading this book, one's vision of both theory and substance may be changed. In particular, distinctions between national and international politics break down as the reader comes to realize that the same collective action problems and a similar (but not identical) range of solutions occur in both arenas.

Overall, the diverse components of this analysis are tightly integrated into a logically coherent whole. Yet, portions of the argument could have been more fully justified, and possible extensions or elaborations are left undeveloped. For example, controversies concerning income redistribution as a justification for governmental intervention are not discussed. Also, contrasts between democratic and autocratic regimes are not presented systematically. In different chapters democratic regimes are reputed to be both *less* concerned with maintaining a long-term reputation for toughness (by negotiating with terrorists) and *more* concerned with the longer term welfare of future generations (by protecting the environment). There may not be a direct contradiction here, since different actors (officials seeking reelection versus public preferences) were used in these examples, but the overall implications of democratization remain unclear.

The chapter on the "architecture of institutions" posits a developmental sequence in which a small group of like-minded states cooperate on an ad hoc basis and generate reliable information about the magnitude of the problem, thus providing the basis for negotiation of generally applicable treaty restrictions. The author admits this process may need to be supplemented with a minimal global infrastructure that can define property rights and sanction treaty violators. One important question was left unexamined, however. Since, as the author demonstrates, separate environmental problems are interrelated in the physical world, is it not possible that the international community needs to respond in a more comprehensive fashion? I share the author's skepticism regarding calls for comprehensive schemes of global governance, but I would like to have seen a stronger analytical basis for his dismissal of this alternative.

One unfortunate omission is application of the theoretical argument to multinational corporations and nongovernmental organizations. Sandler focuses almost exclusively on the incentives facing national governments, which remain the single most important type of actor in transnational dilemmas. He does discuss INTEL SAT as an example of nongovernmental provision of a club good, but this possibility could easily have been included in the initial presentation of the theoretical framework. (Some public policy analysts see nonprofits as filling gaps left open by market and government failures.)

This book develops a series of important connections between theory and substance in an eminently clear fashion. Basic background data are provided for major environmental concerns (plus transnational terrorism), but an expert in any one substantive area is likely to feel slighted by the frequent changes in topic. A reader seeking technical details will be disappointed by Sandler's informal style. Such readers can turn to other sources, including books by this same author.

But when it comes to demonstrating the benefits of comparison across different substantive issues, the importance of cross-issue linkages, or the value of communication between policy analysts and game theorists, this book would be hard to beat.

Reversing Course: Carter's Foreign Policy, Domestic Politics, and the Failure of Reform. By David Skidmore. Nashville, TN: Vanderbilt University Press, 1996. 256p. \$29.95.

Gordon Silverstein, *University of Minnesota*

Jimmy Carter may be the most successful and celebrated former president in American history (though John Quincy Adams's recent appearance in *Amistad* may give Carter a brief chase). Yet, Carter was all but hounded out of office in 1980, denounced for a disastrous domestic economic policy and a vacillating and ineffective foreign policy. Has Carter simply improved with age (and declining official responsibilities)? Or have we rushed to judgment and condemned Carter's term in the White House unfairly?

It has been argued that the Carter administration's "sheer level and range of activity, if not the results, suggested a foreign policy equivalent of FDR's New Deal" (p. xii, quoting Gaddis Smith). This bold foreign policy agenda had been abandoned, however, by the end of Carter's single term in office. David Skidmore argues that the traditional realist view cannot fully explain this reversal of course. Carter did not naively underestimate the threats facing the United States in the late 1970s. Quite the contrary, Carter understood that the real threat would be a refusal to adjust and reconfigure America's commitments in the post-Vietnam era. Nor was it the case, Skidmore maintains, that Carter's foreign policy was incoherent and ineffective. There were important successes (Camp David, the forging of normal relations with the People's Republic of China, the transition to majority rule in Zimbabwe, the negotiation of the Panama Canal treaty, and the negotiation of SALT II were among them), and it was a policy that was intentionally flexible, nonideological, and responsive.

Yet, it was unsustainable. By the end of his term, Carter had swung back to a more traditional Cold War orientation. The reason, Skidmore suggests, is that Carter's policy of adjustment could not be sold at home. Skidmore uses survey data to support his claim that domestic interest groups were able to defeat the liberal internationalism of Carter's early years.

It is not easy to get a nation inclined toward isolationism to commit significant resources to issues and people across two oceans. To do it, Skidmore suggests, realist foreign policy has to be recast into a doctrinal form built on simple, declarative rationales. These are subject to clear and inflammatory symbolic language that links those policies to traditional American ideological values. Finally, there has to be a clear threat, and often that means an overstated threat so that sweeping solutions can be over-sold to the American people. In the case of the Cold War, the result was an activist foreign policy which eventually could not be sustained by a declining hegemonic power. (Skidmore acknowledges the vibrant debate over whether the United States was a declining hegemon, but this discussion is relegated to a footnote.)

For Skidmore, the determining variables in a declining nation's reaction to the need for a foreign policy of adjustment are the degree of external compulsion and the degree of domestic constraint. When external compulsion is high, the

realist would expect policymakers to try to adapt and adjust. When it is low, one would expect a state to remain fairly rigid and resist change. But the second variable complicates things: Even when external compulsion is high, a state with a weak domestic power structure will be bogged down by domestic interests, and it will be unable to adjust foreign policy as realists would have it do. "Contrary to the predictions of realist theory, such states might well pursue strategies of resistance, despite the excessive external costs such a strategy entails. They can better afford to ignore international change than to ignore the vested interests or ideological constraints that favor existing policies" (p. 9). Carter's mistake was not a naive underestimation of the world abroad but an underestimation of the powerful interests that were vested in resisting change in American foreign policy.

The central purpose of this study, the author maintains, is "diagnostic rather than prescriptive" (p. 176), and in its diagnosis it is quite convincing. But there is just enough prescription and analysis in the book to leave the reader looking for more. Skidmore does provide one chapter on the post-Carter administrations of Reagan, Bush, and Clinton, but the book ends without specific prescriptions for how future presidents (or leaders of any other declining hegemon) might avoid Carter's pitfalls.

The book opens the door to a broad theory of hegemonic decline that would integrate realist and institutionalist views, but it leaves the reader wondering about the general application of such an approach. Though Skidmore makes good use of Aaron Friedberg's work (*The Weary Titan: Britain and the Experience of Relative Decline*, 1988) to consider some comparisons of the Carter years to the situation faced by Great Britain before World War I, it is just enough to whet the appetite. Would Skidmore's focus on domestic political structure, interest groups, and elite opinion hold up in a more extensive comparison? One suspects that it would and that such a comparison would bolster the general application of his theory.

Carter may have had the right foreign policy, but he clearly was unable to sell it at home. Skidmore shows us just how high and deep was the opposition, how difficult the task. And though the task may well have been impossible, one wonders just how it was perceived within the administration. Were alternative strategies pursued to defeat the opposition? Were the best strategies employed? Impossible tasks require extraordinary means. The only way out, it seems, was for the Cold War to come to a sudden end.

Skidmore concludes with a discussion of the opportunity presented to Bill Clinton and the United States in the wake of the end of the Cold War. There is an implicit assumption that the American people are now ready and willing to endorse an activist, liberal-internationalist foreign policy. But is that a safe assumption? Are not the same political-cultural forces that drove Truman and others to use extreme rhetoric in an effort to legitimate an activist foreign policy still in place? Is it so clear that we are no longer a nation powerfully inclined to isolationism? If so, then it is all the more important to study how Carter tried to sell his policy—and how that effort failed.

Skidmore convincingly argues that how foreign policy is sold to the American people is crucial, since "the vested interests that form around current policies as well as the strategy chosen for building legitimacy around these policies can alter domestic structures in such a way as to constrain future policy choices" (p. 179). In other words, as you sow, so shall you reap. Certainly, that is a useful lesson for any policymaker, particularly for those making American foreign policy in the post-Cold War era.

Anarchy, Order, and Integration: How to Manage Interdependence. By Harvey Starr. Ann Arbor: University of Michigan Press, 1997. 165p. \$39.50.

Steve Chan, *University of Colorado at Boulder*

Much of the international relations literature has been taken up by the debate between the proponents of the realist and liberal perspectives. Instead of setting up these perspectives as dichotomous and exclusive explanations, Harvey Starr argues persuasively that it will be far more fruitful to investigate the scope conditions under which a particular theory should be most useful for accounting for specific empirical phenomena. In this endeavor, the ecological approach formulated by Harold and Margaret Sprout ("Environmental Factors in the Study of International Relations," in James N. Rosenau, ed., *International Politics and Foreign Policy*, 1969) offers an especially useful way to think about the interaction between foreign policy actors and their environments. While certain aspects of actors and environments in international relations endure over time, others change.

The central thesis of Starr's book is that international relations can be best understood as the manner in which actors seek to adapt to their changing environment. This environment is characterized by a variety of systemic attributes including structural anarchy. Contrary to the arguments of realists, however, the formally anarchic nature of the international system is not a very helpful analytical pivot for engaging in research or policy design. The Westphalian institution of sovereign states has been in existence for some time, and the imperative of self-help that this tradition has supposedly engendered is a historical constant that obviously cannot in itself account for variations in international relations. Rather, the key insight to understanding international relations is that while states remain the most consequential actors, they must face and learn to adapt to a changing environment. The dominant feature of this reality is growing interdependencies.

Accordingly, Starr offers a perspective that is dynamic rather than static, and one that stresses the interaction between agent and structure rather than environmental determinism. In this perspective, learning and adaptation play an important evolutionary role whereby actors attempt to overcome the problems of collective action and security dilemma. Consequently, actors are not hopelessly trapped by situational imperatives. They are instead capable of making choices and adjusting behavior so that concerns about defection and free-riding can be alleviated and cooperation to increase mutual gains can become possible. International laws, regimes, and institutions facilitate such mutual partisan adjustment. At the same time, however, Starr's formulation acknowledges that actors are not completely free agents. Although they are able to select policies and adjust conduct, their menu of choice is limited by historical and structural conditions. Thus, both willingness (an actor's volition) and opportunity (constraints imposed by the environment) matter (Benjamin A. Most and Harvey Starr, *Inquiry, Logic and International Politics*, 1989). Either alone is inadequate for understanding international relations.

Significantly, the relevant environment for foreign policy actors is not limited to international conditions. Starr's discussion includes two-level games and the democratic-peace proposition. Thus, the reader is presented with not just an outside-in view of foreign policy, but also an inside-out one. That is, Starr shows that reciprocal influence operates between domestic and international politics. Thus, for example, democratic institutions and cultures have had a pacifying effect on the foreign relations of those countries sharing these

attributes. The peaceful relations and "relative acceptance" among such like-minded countries are, as Starr suggests, symptomatic of the more general processes of integration formulated by Karl Deutsch and his colleagues about four decades ago (*Political Community and the North Atlantic Area*, 1957).

As already noted, Starr offers a dynamic view of international relations whereby complex feedback loops link actors and their environments. Actions have consequences that shape and reshape the environment, and the environment in turn presents new challenges and opportunities that influence subsequent behavior. The recent diffusion of democracy across international borders provides one such example. The initiation of democratization by some countries encourages others to follow suit. Thus, foreign events can have domestic consequences. Conversely, as more and more countries adopt democratic institutions and practices, their changing domestic situation can have a global effect in promoting new norms and patterns of international relations. A world populated by a majority of democratic states might reflect very different "rules of the game" than one composed predominantly of autocracies (Bruce Russett, *Grasping the Democratic Peace*, 1993).

Despite its compact size, this book presents an amazingly comprehensive analysis of international relations. It offers an informed discussion of contemporary problems of international cooperation in the post-Cold War world, and it embeds this discussion in the context of enduring issues and classic theories of international relations. Moreover, it presents a very effective synthesis of the writings of some of the most influential scholars of international relations (e.g., Axelrod, Bull, Deutsch, Putnam, Rosenau, Rosecrance, Russett, the Sprouts). This is an outstanding book that all graduate students of international relations should be required to read.

Interpreting Chinese Foreign Policy: The Micro-Macro Linkage Approach. By Quansheng Zhao. Oxford: Oxford University Press, 1996. 281p. \$55.00 cloth, \$19.95 paper.

Yufan Hao, *Colgate University*

Few subjects are more complicated and mysterious than Chinese foreign policy. During the Cold War, China was the only country that had confronted (militarily at one time) both superpowers simultaneously and used force to pursue its national interests in a way unanticipated by many in the West. As in any major country, foreign policy in China is a multidimensional puzzle, and Western scholars have been trying to explain it since the establishment of the People's Republic. So far there has been little consensus and much frustration in this field of study, to say nothing of the failure to bring it into the mainstream of theoretical inquiry.

In an ambitious attempt to bridge the gap between Western social science theories and the analysis of Chinese foreign policy, Zhao tries to apply a micro-macro approach adapted from sociological theory (George Ritzer, ed., *Frontiers of Social Theory*, 1990). He argues that one should not look at single-level constraints only (either international or domestic) but, rather, should link different levels of analysis, including the micro levels of individual decision makers and the macro levels of state institutions and the international system (p. 22). In building his multilevel model, Zhao modifies the evolutionary model of Bernhard Giesen ("Beyond Reductionism: Four Models Relating Micro and Macro levels," in *The Micro-Macro Link*, ed. Jeffrey Alexander et al., 1987) and arranges his macroanalysis into three dimensions.

(1) The symbolic macrostructure emphasizes Beijing's interpretation of international and domestic developments and how changes in interpretation have affected changes in priorities since 1978 (chap. 3). (2) The institutional macrostructure stresses change in the Chinese policymaking apparatus and how the shift from one-man domination (vertical authoritarianism) to a decentralized structure with the growth of bureaucratic participation (horizontal authoritarianism) affected Chinese foreign policy making (chap. 4). (3) The power/regime macrostructure examines the sources of Chinese power politics and regime legitimacy as well as individual leaders' policy preferences (chap. 5).

This book is a welcome addition to the literature. Its contribution lies in its effort to call attention to constraints on various levels affecting Chinese foreign policymaking and to bring Western social science theories into the field. It also provides some useful information on how professionals and bureaucrats gained more opportunities to participate in the making of Chinese foreign policy in Deng's era. The suggested framework seems to be well constructed and could be potentially valuable. Unfortunately, the way it is applied is problematic. Zhao seems to have handled the balance between historical facts and his model in a hasty manner. There is hardly any analysis of the influence of individual decision makers on the microlevel in the three chapters dealing with macro changes. The author seems to believe that the "facts" speak for themselves; he simply introduces the model, collects some related information, and presents it without adequate analysis. The reader cannot discern how the microlevel variables interact. The model seems to explain some of the changes in Chinese foreign policy in the late 1970s and

early 1980s, but some fundamental questions remain unanswered. How can the change in China's policies toward the two superpowers during the Cold War be explained by this approach? What about the changes in Chinese policy toward neighboring countries, the Third World, Europe, and Japan during and after the Cold War? Why has China resorted to force in pursuing national interests? How and why was the policy toward Taiwan made in the way it was both during and after the Cold War? The three macro chapters are followed by an interesting but not particularly relevant chapter on Japanese development assistance to China, leaving the whole structure of the book in question.

Some historical facts are treated carelessly. For example, Zhao states that China's decision to enter the Korean War in 1950 "prompted President Truman to order the U.S. Seventh Fleet into the Taiwan Straits to guarantee Taiwanese security" (p. 43). But the decision to neutralize the Taiwan Strait was made several months before the Chinese intervention and, to a great extent, prompted Mao's decision to intervene, not vice versa.

Despite the good case study of Japanese development assistance to China, the book falls short of devising a "comprehensive" theory of Chinese foreign policy. But it does suggest an interesting approach waiting to be tested. It is also a commendable attempt to bridge the gap between social science theory and Chinese studies. Zhao's contribution to our understanding of Chinese foreign policy would have been greater had he squarely and accurately incorporated the historical facts into his model, and then used it to interpret major events in China's diplomacy over the past half century.

Diplomacy for the Next Century

Abba Eban

"Exceptionally well written. [This book] is entirely free from jargon, obscurity, and cliché, and it has a concision and elegance that are rare in writing about international affairs....Eban is at ease with the history of diplomacy, early and recent, in a way that is rare today....The book is studded with crisp and illuminating characterizations of leaders with whom [Eban] worked."

Individuals, Institutions, and Public Preferences over Public Finance

JOHN MARK HANSEN *University of Chicago*

This study examines public preferences over deficits, taxes, and spending. Using responses to public opinion questions designed for the purpose, the article assesses the state of preferences as expressed by individuals and as represented in government. One section examines the characteristics of individual preferences—their completeness, consistency, and coherence. Public opinion is remarkably well structured and overwhelmingly partial to the policy status quo. A second section explores the properties of mass preferences as they are aggregated by several different kinds of institutional voting rules. Institutions matter, at least to a point: Consistent institutional differences over federal budget policy trace directly to the diverse means by which institutions represent the public's positions. The conclusion assesses the meaning and import of the public's resistance to budget policy change.

Of the many ideas that animate democracy, in both theory and practice, one of the most audacious demands that the preferences of ordinary citizens count for something in the creation of public policy. To this end, democracies contrive that citizens express their views and that public officials attend to them, not least within the elaborate institution of competitive elections.

To critics of democracy, friendly though they are, its confidence in the aptitude of the people and its faith in the capability of institutions are misplaced. To some critics, the problems of democracy stem from the incompetence of the citizenry. People lack complete, consistent, and realistic preferences on most public policy issues, and especially on the most important. They are simply not equipped to choose (e.g., Campbell et al. 1960, chapter 10; Converse 1964; Lippmann [1922] 1997; McClosky 1964; Stokes 1963). To other critics, the problems of democracy inhere in the incapacity of democratic institutions. Whether or not voters are capable, democratic institutions can never realize coherent, decisive, and responsive collective choices, no matter how elegant their design. It takes more than the votes of the people to produce a "democratic" decision (Arrow [1951] 1963; Mueller 1989).

The charges against democratic citizens and institutions echo in the contemporary American debate over the public budget. In the last two decades, the United States has demonstrated its simultaneous susceptibility to the charms of public expenditure and tax reduction, resulting in the 1980s in the greatest peacetime recourse to debt finance in American history. It is not surprising that these developments have drawn considerable interest from politicians, the press, and academe. Their diagnoses of the "budget mess" are varied,

but for many, the pathogen lies in democracy itself, in public preferences and the institutions that aggregate them.

By one line of argument, the federal budget is intractable because the public's preferences over spending, taxes, and deficits are fundamentally irrational. In the most malign variant, people hold positions on public budgeting that are blatantly impractical. They believe in the free lunch; they want something for nothing. In the more benign variant, people hold positions on public budgeting that are incomplete or internally inconsistent. They are unable to tell whether they prefer one proposal to another. They are unable to choose among budget alternatives without contradicting themselves. Whatever the cause, whether willfulness or cognitive incapacity, citizens' preferences over the federal budget options are logically incoherent (Buchanan and Wagner 1977; Citrin 1979; Free and Cantril 1967, chapter 2; Ladd et al. 1979; Modigliani and Modigliani 1987; Mueller 1963; Sears and Citrin 1985).

By a second line of argument, the federal budget is intractable because the American institutions that amalgamate public preferences produce only irresolution and stalemate. In the dominant view, the constitutional system of separate institutions sharing powers is a recipe for gridlock, as the president, the Senate, and the House of Representatives register the same public preferences differently. Gridlock freezes the budgetary status quo, even in instances in which majority rule produces a winner. But even majority rule, we know, cannot be counted upon to yield coherent collective choices, particularly when options are multifaceted. The state of the federal budget illustrates not irrationality of preferences but irrationality of process (Brady and Volden 1997; Inman and Fitts 1990; Krehbiel 1996; McCubbins 1991; Roubini and Sachs 1989; Tabellini and Alesina 1990; for a review see Peters 1991, chapter 4).

This article takes a hard look at individuals, institutions, and their preferences over public finance. Using responses to public opinion questions designed for the purpose, it assesses the state of public preferences as expressed by individuals and as represented in government. The next section examines the characteristics of individual preferences—their completeness, consistency,

John Mark Hansen is Professor of Political Science, University of Chicago, Chicago, IL 60637-1828.

This research originated during a fellowship at the Center for Advanced Study in the Behavioral Sciences, with support from the National Science Foundation, grant SES-9022192. For assistance with the research, I am indebted to Meredith Rolfe. For helpful comments, I am especially grateful to Stephen Ansolabehere, Larry Bartels, James Fearon, Taeku Lee, Laura Stoker, Craig Volden, John Zaller, the members of the Planning Committee for the 1995 American National Election Pilot Study, and the anonymous referees.

tency, and coherence. Public opinion is remarkably well structured and overwhelmingly partial to the policy status quo. The following section explores the properties of mass preferences as they are aggregated by several different types of institutional voting rules. Institutions matter, at least to a point: Consistent institutional differences over federal budget policy trace directly to the diverse means by which institutions represent the public's positions. Still, the analysis raises questions even as it answers them. The conclusion confronts one lingering issue, the meaning and import of the public's resistance to budget policy change.

INDIVIDUAL PROPERTIES OF PREFERENCES OVER SPENDING, TAXES, AND DEFICITS

Despite the perennial importance of federal budget making, information about the views of the public is sparse and unsystematic. Most of the survey data concern voters' inclination to spend more, less, or the same on a host of public programs (and reveal that majorities wish to spend more money on just about everything; see Advisory Commission on Intergovernmental Relations 1972, 1974–94; Page and Shapiro 1992, chapter 4; Thomas 1991). More seriously, even the best survey instruments have neglected the essential aspect of the public budgeting problem: the tradeoffs inherent in establishing public priorities. Typically, survey questions offer respondents unrealistic choices among incomplete sets of options (Page and Shapiro 1992, 161; Sanders 1988; Tuchfarber, Oldendick, and Bishop 1984; Welch 1985).

As an alternative, the 1995 Pilot Study for the 1996 American National Election Study (NES) asked 12 questions to a national probability sample of 486 Americans of voting age, randomly resampled from the respondents to the 1994 NES (Rosenstone et al. 1995).¹ By design, the questions offered respondents choices among a complete set of budget tradeoffs. They divided the budget options into two exhaustive and mutually exclusive revenue categories—taxes and deficits—and two exhaustive and mutually exclusive expenditure categories—domestic and defense. By design, moreover, they presented respondents with realistic budget choices, that is, with tradeoffs. For each pair of policies, the questions asked people to accept or reject a budget proposal that made them better off on one dimension (by lowering taxes, reducing the deficit, raising domestic outlays, or increasing defense spending) but left them worse off on another (by raising taxes, enlarging the deficit, reducing domestic programs, or cutting back on defense).² The questions, in

short, derived from the structure of the public budgeting problem. By putting everything on the table and by posing tradeoffs, the questions reproduced the fiscal choices before the nation. The complete battery, with marginals, is given in Table 1. (For more details about the study and its administration, see the Appendix.)

By virtue of the correspondence between the questions and the policy problem, respondents' choices among the tradeoffs revealed their preferences for spending and extraction relative to the status quo. On the most basic level, each acceptance indicated a preference for a new policy, and each rejection indicated a preference for existing policy (Samuelson 1938, 1948; Sen 1973; Varian 1982). Reviewing Table 1, the most striking feature of the responses is the prevalence of tradeoffs refused, that is, the popularity of the status quo. Majorities accepted every tradeoff that cut defense spending but rejected every other, usually by overwhelming margins. Only one respondent in three was willing to raise taxes or increase the deficit to finance greater domestic spending. Just one in five was inclined to cut domestic spending or widen the deficit to lower taxes. No more than one in eight was disposed to do anything at all to increase defense spending.³ On the face of it, the problem the public creates for policymakers is that it does not want what its leaders seem to want (cf. White and Wildavsky 1989).

Otherwise, however, the public's opinions on the federal budget were hardly troublesome. First, as Table 1 shows, most individuals had complete preferences. Together, "don't know" responses, refusals, and administrative failures to ascertain did not exceed 3% on any of the 12 items; the average was 1.5%. Nearly 89% of the respondents gave valid replies to every question. Of the remainder, only one-third (4% in all) failed to give an answer more than once. Second, most individuals had coherent preferences. Because the question battery balanced each policy proposal with its direct opposite, respondents' choices within each pair declared their rankings of the two alternatives and the status quo. Individuals who accepted one side of a tradeoff and rejected the other revealed a preference for one option over the other and the status quo. Similarly, respondents who rejected both sides of a tradeoff revealed their preference for the status quo.

If we can assume that people's preferences are convex (single-peaked), then their choices in tradeoffs revealed still more. Individuals who accepted one side of a tradeoff and rejected the other displayed their preference for one policy package over the status quo over the opposite package. In so ordering the outcome

¹ To be sure, the sample size is not large. Six of the twelve items were extended onto the 1996 NES, those dealing with tradeoffs among deficits, taxes, and domestic spending. Although the cuts halve the administration time, they seriously undermine the ability to make inferences about citizens' budget preferences, as the options presented are no longer exhaustive.

² These are gross categories, of course, and the analytical possibilities would undeniably have been richer had the categories been finer. Unfortunately, the complete set of tradeoffs requires $k \times (k - 1)$

questions for k budget categories, and survey time is limited. The division of federal expenditure and federal revenue into two categories each, I believe, was a reasonable balance between realism and detail, on the one hand, and cost, on the other.

³ Particular hostility to defense spending but overall partiality to the budgetary status quo has emerged in a number of other studies as well, here and abroad (Cullis and Lewis 1985; Hibbs and Madsen 1981, 428–9; Kay et al. 1992; Page and Shapiro 1992, chapter 4; Thomas 1991; *Times Mirror* 1989). Favoritism toward the status quo has been more generally observed as well (Samuelson and Zeckhauser 1988). I have more to say about both subjects later in the article.

TABLE 1. Question Wording and Marginals

Each year the government in Washington has to make decisions about taxes, spending, and the deficit. We'd like to know your opinions about what the government should do about the budget. I'm going to read you three proposals for cutting the federal budget deficit, and I'd like you to tell me whether or not you would favor each of them.

	Yes, Favor	No, Do Not Favor	Don't Know	Refused, Not Ascertained	Total (N)
Do you favor increases in taxes paid by ordinary Americans in order to cut the federal budget deficit?	23.7%	75.3	0.6	0.4	100.0% (486)
Do you favor cuts in spending on domestic programs like Medicare, education, and highways in order to cut the federal budget deficit?	21.8%	76.1	1.9	0.2	100.0% (486)
Do you favor cuts in spending on national defense in order to cut the federal budget deficit?	55.4%	42.6	1.4	0.6	100.0% (486)

Now I'm going to read you three proposals for cutting taxes, and I'd like you to tell me whether or not you favor each of them.

	Yes, Favor	No, Do Not Favor	Don't Know	Refused, Not Ascertained	Total (N)
Do you favor cuts in spending on national defense in order to cut the taxes paid by ordinary Americans?	52.5%	45.3	1.9	0.4	100.1% (486)
Do you favor cuts in spending on domestic programs like Medicare, education, and highways in order to cut the taxes paid by ordinary Americans?	19.8%	78.8	1.2	0.2	100.0% (486)
Do you favor an increase in the federal budget deficit in order to cut the taxes paid by ordinary Americans?	16.7%	81.1	2.3	0.0	100.1% (486)

Now we'd like to ask you a few more questions about what the government in Washington should do about the budget. I'm going to read three proposals for increasing spending on domestic programs like Medicare, education, and highways. I'd like you to tell me whether or not you favor each of them.

	Yes, Favor	No, Do Not Favor	Don't Know	Refused, Not Ascertained	Total (N)
Do you favor cuts in spending on national defense in order to increase spending on domestic programs like Medicare, education, and highways?	59.7%	38.3	1.0	1.0	100.0% (486)
Do you favor an increase in the federal budget deficit in order to increase spending on domestic programs like Medicare, education, and highways?	30.9%	67.7	1.2	0.2	100.0% (486)
Do you favor increases in the taxes paid by ordinary Americans in order to increase spending on domestic programs like Medicare, education, and highways?	34.0%	64.6	1.0	0.4	100.0% (486)

Now I'm going to read you three proposals for increasing spending on national defense. I'd like you to tell me whether or not you favor each of them.

	Yes, Favor	No, Do Not Favor	Don't Know	Refused, Not Ascertained	Total (N)
Do you favor an increase in the federal budget deficit in order to increase spending on national defense?	14.6%	84.0	0.8	0.6	100.0% (486)
Do you favor increases in the taxes paid by ordinary Americans in order to increase spending on national defense?	12.7%	86.8	0.4	0.0	99.9% (486)
Do you favor cuts in spending on domestic programs like Medicare, education, and highways in order to increase spending on national defense?	9.3%	90.1	0.2	0.4	100.0% (486)

TABLE 2. Revealed Preferences in Tradeoffs (Percentage of Yes/No Responses)

Tradeoff Dimension	Prefer First Named	Prefer Status Quo	Prefer Second Named	Prefer Both at Once	Total (N)
Lower deficits versus lower taxes	19.2%	64.0	11.9	4.9	100.0% (470)
Lower deficits versus greater domestic spending	19.6%	49.2	28.7	2.6	100.1% (470)
Lower deficits versus greater defense spending	52.3%	32.8	10.6	4.3	100.0% (470)
Lower taxes versus greater domestic spending	15.4%	50.3	29.6	4.7	100.0% (473)
Lower taxes versus greater defense spending	50.7%	36.4	9.7	3.2	100.0% (473)
Greater domestic spending versus greater defense spending	59.0%	31.7	7.4	1.9	100.0% (473)

states, they revealed priority or strict preference for one budget option over the other. For instance, as can be seen in Table 2, by agreeing to defense cuts in order to lower taxes and then objecting to higher taxes in order to raise the military budget, nearly 51% disclosed their preference for lower taxes over the status quo over more defense. Similarly, respondents who rejected both sides of a tradeoff displayed their preference for the status quo—for the current balance of the two options—over both alternative policies. And although respondents provided no information about their rankings of the two alternatives relative to each other, it will be useful to the investigation—and conservative—to treat them as having revealed indifference between the two policy options. Thus, by rejecting cuts in domestic spending in order to close the deficit and then rejecting larger deficits in order to fund domestic programs, 49% expressed their satisfaction with the existing balance between deficit finance and domestic expenditures. Finally, respondents who accepted both sides of a tradeoff revealed inconsistency in their preference between the two alternatives and the status quo. By agreeing first to reallocate money from domestic programs to defense and then agreeing to reallocate money from defense to domestic purposes, 2% indicated their inability to keep their preferences straight.⁴

As Table 2 shows, most individuals made consistent choices across the six budget policy pairs. It is not surprising, given the marginals, that indifference between policy alternatives and support for current policies predominated. Majorities strictly preferred smaller deficits, lower taxes, and greater domestic expenditure to larger defense outlays or the status quo.

⁴ For elaborations of the underlying choice theory, see Hansen (1995) and Ordeshook (1986, 33–7). The inferences clearly depend upon the convexity assumption. In this context, I believe that the assumption is justified. The questions structure each tradeoff on a single dimension that is conceptually continuous, and it is difficult to contrive a “sensible story” about preferences over taxes, deficits, and spending that implies multiple local ideal points on a single continuous dimension. Even if the assumption is unjustified, however, its effect is most probably conservative. It will bias the study against the finding that individual budget preferences are consistent with the axioms of rationality.

For every other policy pair, majorities or near-majorities endorsed the existing state of affairs.

Perhaps more surprising is that only a small portion of the public revealed policy choices that were inconsistent. Just 5% simultaneously subscribed to tax finance for deficit reduction and deficit finance for tax reduction, and they were the most numerous. Across the six pairs of budget tradeoffs, moreover, only 12% made inconsistent policy choices even once, and most—nearly three-quarters—did so only once, as can be seen in Table 3, column 1. The consistency is all the more remarkable because of the difficulty of the task the battery presented to respondents. For four out of the six pairs of budget alternatives, the opposite sides of tradeoffs were separated by 15–20 minutes of survey content. (See the Appendix.) The instrument gave respondents ample opportunity to forget their answers to the first side of a tradeoff by the time they encountered the second.⁵ Thus, the portion of the electorate that seeks something for nothing is decisively in the minority. Most people recognize that they cannot have budget tradeoffs both ways.⁶

⁵ The two tradeoffs whose opposite sides were administered a few minutes apart, deficits paired with taxes and domestic paired with defense spending, should be most susceptible to remembered responses. But as Table 2 shows, the first pair had the largest proportion of inconsistent responses, and the second pair had the smallest. In fact, inconsistencies were more likely to involve taxes than other options. As Table 2 also shows, the two tradeoffs with the greatest incidence of inconsistent responses paired taxes with deficits and with domestic spending, both nearly 5%. (The pairing between taxes and defense spending had the fourth highest incidence.) By conjecture, I attribute this tendency to the stubbornness of “supply-side” views, even though supply-side arguments deny a tradeoff between tax rates and revenues, not between tax revenues and other options.

⁶ Inconsistencies appear to be a mix of mistaken response (that is, measurement error) and willfulness. I shall present evidence of measurement error below. Other analyses show that the probability of an inconsistent response is predicted most strongly by education (educated people are more likely to recognize the tradeoffs) and by intensity of preference for spending (people who score highest on the NES domestic and defense spending batteries are less likely to observe the tradeoffs). The probability of an inconsistent response was unrelated to interest in politics, political knowledge, and the interviewer’s assessment of the respondent’s intelligence (Hansen 1996, 3–4 and Table 5).

TABLE 3. Incidence of Transitive, Intransitive, Inconsistent, and Incomplete Preference Orderings

	As Originally Revealed	With One Amendment ^a
Transitive orderings	40.3%	80.5%
Strict transitive	3.9	7.8
Weak transitive	36.4	72.6
Intransitive orderings	36.0	5.5
Inconsistent orderings	12.4	6.7
Incomplete orderings	11.3	7.2
Total	100.0%	99.9%
(N)	(486)	(486)

^aFor details of the amendment procedure, see the Appendix.

Finally, the greatest number of individuals revealed preferences in pairwise choices that were consistent with each other. Taken together, respondents' replies to the 12 questions established their preference orderings over the four budget policy options. With four preference objects—smaller deficits, lower taxes, greater domestic spending, and greater defense spending—there are 24 strict preference orderings plus another 51 weak orderings, which include what I have provisionally defined as indifference, for a total of 75 transitive orderings.⁷ As shown in Table 3, column 1, a plurality of the respondents, 40.3%, revealed preference orderings that were completely transitive. Consistent with the survey marginals, preference rankings that included indifference were most numerous: Weak preference orderings exceeded strict preference orderings by a ratio of 9 to 1 (36.4% versus 3.9%). And although the data are not reported in the table, indifference predominated in the most frequent responses. Overall, one in every twelve respondents answered "no" to every proposal, revealing indifference over the four budget options or, equivalently, satisfaction with current budget allocations. But the most common response profile combined indifference and strict preference. One respondent in every ten accepted every proposal that reduced defense spending and rejected every other, revealing indifference among deficit reduction, tax cuts, and domestic spending growth but strict preference for each over military spending.

The remainder of the respondents, 36%, had complete and consistent but intransitive preferences over

⁷ Without much more information, infeasible in a survey, I cannot determine the respondents' preference orderings over outcome states. I cannot tell, for example, whether they prefer lower taxes and less defense expenditure to greater domestic spending and higher taxes, or vice versa. With the information and principles of inference at hand, however, I can assess the internal consistency of their implied preference orderings over options, as I do here. The ability to identify orderings over options but not over outcome states probably has a conservative effect on the conclusions. There may be people whose preferences over objects appear inconsistent even though their preferences over states are entirely coherent and even though they have reported their preferences correctly. There may also be people whose preferences over objects appear consistent but whose preferences over states are incoherent, but it seems less likely. Given the nature of their preferences, they would find it difficult to report their preferences without either admitting their confusion or choosing randomly.

public budgets. (See Table 3, column 1.) Even here, however, the problems were not very worrisome. Not a single individual revealed a strict preference cycle: None preferred *A* to *B*, *B* to *C*, and *C* to *A*. Only a bare handful—about 5%—violated strict preference transitivity because of an indifference relation: They preferred *A* to *B*, considered *B* equivalent to *C*, but still preferred *C* to *A*. Consistent with previous research, almost all the people who revealed intransitivities violated the transitivity of what I have assumed to be the indifference relation: They found *A* equivalent to *B* and *B* equivalent to *C*, but they preferred *A* to *C*. The phenomenon of intransitive indifference has been given a number of interpretations (Fishburn 1970), but the most common holds that the difference between two options must surpass a "preference threshold" in order for people to discern it (Armstrong 1950; Luce 1956).⁸ I will develop a somewhat different interpretation when I return to the question in the conclusion.

In sum, mass preferences over public finance are remarkably well structured, all in all. Most people have no trouble determining their position on budget policy proposals. Most people have no difficulty avoiding blatant inconsistencies in their choices. Many people have preferences that are complete, consistent, and transitive—this is the modal category—and most of the rest fall prey to only the mildest form of preference intransitivity. The view that ordinary Americans are irrational in a fundamental sense is difficult to sustain.

But perhaps this conclusion is the product of low expectations, of the pessimist's relief that the glass is only half empty or the optimist's joy that the glass is half full. After all, the proportion of the electorate with fully "rational" preferences is well short of a majority, and substantial numbers of people reveal inconsistent or incomplete preferences.

The objection is well taken, but it does not get very far. The estimates of completeness, consistency, and transitivity reported here are more likely than not conservative. It is not possible to tell for sure from these data, but if individuals' preferences are not, as assumed, single-peaked, then actual violations of consistency and transitivity were almost certainly less frequent than stated. Moreover, if individuals' preference for the status quo in a pair of tradeoffs does not also imply indifference between the two budget alternatives, as I have assumed, then intransitivities of indifference may not exist at all. Again, it is impossible to judge from these data, but if all the cases interpreted here as indifference are instead unobserved preference,

⁸ Intransitive indifference is so common that it has spawned its own literature, capably reviewed by Fishburn (1970). It also has given rise to a special designation for these almost-transitive preference orderings: quasi-transitivity (see Radcliff 1993). Nearly 72% of the respondents have quasi-transitive preferences. Of course, even intransitivities of the indifference relation violate strict preference transitivity in one sense: If *A* is preferred to *C*, *C* is equivalent to *B*, and *B* is equivalent to *A*, then *A* is implicitly preferred to *A*. Brady and Ansolabehere (1989) also found substantial incidence of indifference intransitivity, and their data (choices from among sets of presidential candidates) allow them (unlike me) to estimate the size of the threshold. They found the size of the threshold closely related to the amount of information people have about the candidates.

TABLE 4. Incidence of Partial Preference Orderings, in Percent

	As Originally Revealed	With One Amendment ^a
All four options ordered	40.3%	80.5%
Two of four options ordered	3.3	3.1
One of four options ordered	18.3	10.1
None of four options ordered	38.1	6.4
Total	100.0%	100.1%
(N)	(486)	(486)

^aFor details of the amendment procedure, see the Appendix.

and if the unobserved preferences are in fact internally consistent, then not 40% but 76% of the respondents had complete, consistent, and transitive preferences over the four budget options.

But suppose the assumptions I have made in drawing inferences from these data are merited. The objection still does not go far. First, survey measurement is notoriously error prone, and with twelve questions asked in the context of dozens of others over a three-quarter-hour span, people have many opportunities to make mistakes, to reply "no" when they mean "yes," and vice versa. In one of their experiments, Brady and Ansolabehere (1989, 149–50) allowed subjects to review their choices from among presidential candidates. Their respondents invariably amended their answers in the direction of greater—often *much* greater—congruity.

The Pilot Study did not allow these 486 individuals to review their responses, but we know that 81% of the respondents were within a single answer of transitivity.⁹ (For the evidence, see Table 3, column 2; for the method of calculation, see the Appendix.) Ninety-one percent of the individuals whose preferences were complete and consistent but intransitive could have achieved transitivity by amending their answer to a single survey question, most often by changing a "no" (indifference) to a "yes" (strict preference).¹⁰ An overwhelming majority of the American public is very nearly fully rational in its budget preferences.

Second, the vast majority of the respondents expressed preferences in pairwise comparisons that were logical and informative, even if they did not comply fully with the axioms of rationality. As Table 4 indicates, despite incompleteness, inconsistency, or intransitivity, at least one budget option can be ordered relative to the other three in 62% of the cases. (At worst, that is, we can tell that one option is first or last in priority, even if we cannot order the other three. Or we can tell that two options are both superior, both inferior, or one superior and one inferior to the other two options, even if we cannot tell which of the two others the respondent prefers.) With my amendment of a single survey answer, at least one option can be

positioned in 94% of the cases. (I will refer to these consistent pairwise orderings as a "rational binary preference" and employ them throughout the analysis of institutional aggregation in the next section.) Put differently, individuals revealed a coherent ordering in at least half the pairwise comparisons almost two-thirds of the time, without any amendment whatsoever.

Finally, presented with the difficult task of keeping their preferences straight on 12 questions asked among 200 items over 45 minutes, people did much better than chance. Leaving aside the option of nonresponse, probability theory predicts that just 2% of the 4,096 possible patterns of yes-no answers to the 12 questions will correspond to complete, consistent, and transitive preference orderings, yet 40% of the respondents exhibited them. Guesswork should yield 21% of the sample no more than one answer short of a transitive orderings, but 81% of the respondents were in this category. The respondents, that is, were much better than lucky. Given the demands of the task, ordinary citizens exceed high expectations.

The conclusion is optimistic but should come as no great surprise, at least on one level. It squares with the findings of Brady and Ansolabehere (1989) and Radcliff (1993), who investigated the rationality of choices from fields of candidates,¹¹ as well as the more limited findings of Sanders (1988), who investigated attitudes on public spending. Clearly, the strategies of low-information rationality are very well suited to the assessment of budgetary tradeoffs (Page and Shapiro 1992; Popkin 1991; Sniderman, Brody, and Tetlock 1991). People do not need to know very much about the substance of the federal budget to address alternatives to it. They need to know only a little about the rough contours of current policy to decide whether they like it (and they may not need to know even that much). Moreover, in assessing what they might like better, citizens have lots of free information to help them. First, because the media cover budget debates extensively, as they did especially in 1995, people can draw upon their vague knowledge of the alternatives on the agenda and who is for and against them (Carmines and Kuklinski 1990).¹² Second, because the political parties have distinct positions on budget issues, people can assess alternatives through the lens of their own partisanship (Campbell et al. 1960, chapter 6; Popkin 1991, chapter 3). Finally, and most important, because people pay taxes, borrow, and enjoy domestic and defense services from government, they can rely upon their own experiences. Taxes, spending, and deficits are issues about which lots of people know a fair amount, at least enough to tell whether they are satisfied.

¹¹ In fact, they found even better performance, but they gave their respondents an easier task: fewer questions, fewer alternatives, arguably fewer evaluative dimensions, and certainly a more familiar exercise—choosing a candidate.

¹² In fact, the public's performance in 1995 may well represent the high end of the possibilities. If there ever was a time when people should have been aware of budget policy and its tradeoffs, it was during the Pilot Study period of August and September 1995. The new Republican Congress had made its plan to balance the budget in seven years the centerpiece of its legislative program. No doubt, the hard choices involved in making budgets were unusually salient.

⁹ Ninety-two percent—given missing data, nearly all—were within two answers.

¹⁰ Of course, there may be some respondents who reveal transitivity by mistake, but given that so few of the Brady and Ansolabehere (1989) subjects increased incongruity upon reflection, I doubt there are many.

At the same time, however, the conclusion is at odds with an earlier body of research that found reasons to doubt the coherence of Americans' fiscal policy preferences (Citrin 1979; Free and Cantril 1967; Ladd et al. 1979; Modigliani and Modigliani 1987; Mueller 1963; Sears and Citrin 1985). The source of the difference is apparent. Questions about tradeoffs do elicit more circumspect opinions on budgetary alternatives, as Page and Shapiro (1992, 161), Tuchfarber, Oldendick, and Bishop (1984), and Welch (1985) conjectured.¹³ And well such questions should. They introduce "considerations" of both the benefits and the costs of fiscal policy options; they cause respondents to stop and think, at least momentarily (Zaller 1992; Zaller and Feldman 1992).

Having stopped and thought, a large fraction of the survey respondents opted for the status quo. In fact, more than half the individuals with complete, consistent, and transitive preferences achieved "rationality" by rejecting nine or more of the twelve tradeoffs.¹⁴ By itself, the public's partiality toward the status quo does not raise an issue of rationality. Even wrong-headed views can be well structured. But it may suggest that the balanced form of the questions caused respondents to blunder into transitive response profiles through no design of their own. Other evidence indicates this is not the case. On the one hand, as I have shown elsewhere (Hansen 1996, 2–4 and Table 5), the propensity to accept the status quo is unrelated to education, political knowledge, interest in politics, and the interviewer's assessment of the respondent's intelligence. On the other hand, partiality toward current policy is strongly and inversely related to strength of partisanship and to the strength of preference *for or against* domestic and defense spending. Support for the status quo, that is, appears more deliberate than accidental. The structure of public preferences over public finance is related to the conservatism of those preferences, but the structure seems to be substantive.

Thus, the conclusion holds up. The public has the ability to make budget policy choices with reasonable discernment. Allowed by survey questioners to be practical in their views, ordinary Americans are practical in their views. They have well-formed and well-behaved preferences. Ordinary citizens may not have preferences over spending, taxes, and deficits that experts consider "correct," but their opinions are coherent.

¹³ The four budget categories employed in these questions capture only gross policy options, and the public's performance would certainly suffer were the categories finer and the options more numerous. Yet, the evidence here suggests that the task not only is within the cognitive capacities of ordinary citizens but also—and more important—is comprehensible to them. Other approaches can be and have been taken to the measurement of fiscal policy preferences, but I have not been able to discern in them a theoretical basis for inferences about the coherence of mass preferences (Hansen 1995). Whatever the design of the questions, we must (as here) have a model that relates preferences to the answers people give in surveys before we can tell whether they are choosing rationally or irrationally.

¹⁴ Nine rejections is exactly halfway between the extremes. By the rules of inference I have employed in this section, respondents with strict preference orderings should reject six tradeoffs and accept six tradeoffs. Respondents who are satisfied with the status quo should reject all twelve.

INSTITUTIONAL PROPERTIES OF PREFERENCES OVER SPENDING, TAXES, AND DEFICITS

Coherent democratic policy choices require more than coherent individual preferences. Because political institutions intervene between individual and "social" preferences, public choices may be logically inconsistent, even when every individual's private preferences are the model of rationality. As is well known, a majority vote on one among an array of options on a single policy dimension produces a settled outcome only when individuals' preferences are single-peaked. The news gets worse from there. Except under conditions that would seem to be unattainable, majority rule cannot guarantee a determinate social preference when policy choices differ on multiple dimensions (Mueller 1989, chapter 5).

Because of the structure of public preferences in 1995, however, majority rule in this instance causes no such difficulties. Table 5 displays the outcomes of votes on all six of the budget tradeoffs, using rational binary preferences as expressed in the survey and after one of my amendments.¹⁵ As the table shows, the proposal to cut defense spending is the Condorcet winner: A majority favors reducing military outlays, whether to lower the deficit, to decrease taxes, or to increase domestic spending. And assuming there are no restrictions on proposals, whenever individuals vote sincerely in a sequence of majority votes between two options, the Condorcet winner, if it exists, inevitably triumphs (Ordeshook 1986, chapter 6).

Thus, in a majority vote, citizens will opt to cut the defense budget, but to what purpose? As Table 5 shows, they prefer to increase expenditures on domestic programs: Taking individuals who prefer the status quo to be indifferent, a majority favors domestic spending to deficit reduction, domestic spending to tax reduction, and deficit reduction to tax reduction. Hence, if the status quo is voted last, as is commonly the case, then sequential majority rule produces a winner: Reallocate spending from defense to domestic programs. The overwhelming consensus on reductions in military spending combines with some rudimentary rules of parliamentary procedure to produce a majority rule outcome (Shepsle 1979).¹⁶ The individual preferences that are coherent as expressed are also coherent as aggregated by majority rule.

¹⁵ The most dramatic difference between the rational binary preferences as stated by respondents and those I reached with an amendment is the size of the majority supporting defense cuts. In the amended case, the backing for reallocations away from the Pentagon diminishes noticeably, which suggests greater (but still not substantial) latent support for defense. Nevertheless, no matter how much trouble ordinary people have in expressing their preferences consistently, the one thing most of them are sure about is that they do not like defense spending.

¹⁶ In the example, I have assumed sincere voting, as I will throughout for the sake of simplicity. In this particular case, however, the outcome is strategy-proof, although that is not generally true for either sequential majority rule or structure-induced equilibrium (Dion 1992; Mueller 1989, chapters 5, 20). There are too few voters in favor of the defense status quo for their strategic maneuverings to be successful in preserving it.

TABLE 5. Votes in National Referenda by Majority Rule (Rational Binary Preferences)

Tradeoff Dimension	Prefer First Named	Prefer Status Quo	Prefer Second Named	Total	(N)	(Weighted N) ^a
As originally revealed						
Lower deficits versus lower taxes	22.2%	64.7	13.1	100.0%	(221)	
Lower deficits versus greater domestic spending	23.4%	44.7	32.0	100.1%	(244)	
Lower deficits versus greater defense spending	72.0%	20.7	7.4	100.1%	(271)	
Lower taxes versus greater domestic spending	20.2%	43.3	36.6	100.1%	(238)	
Lower taxes versus greater defense spending	71.5%	21.0	7.5	100.0%	(267)	
Greater domestic spending versus greater defense spending	70.9%	20.9	8.2	100.0%	(282)	
With one amendment						
Lower deficits versus lower taxes	22.7%	60.6	16.8	100.1%	(421)	(416.5)
Lower deficits versus greater domestic spending	20.7%	47.3	32.0	100.0%	(434)	(427.5)
Lower deficits versus greater defense spending	59.7%	29.5	10.8	100.1%	(442)	(435.0)
Lower taxes versus greater domestic spending	18.8%	44.8	36.4	100.0%	(437)	(426.0)
Lower taxes versus greater defense spending	59.3%	30.6	10.1	100.0%	(434)	(429.5)
Greater domestic spending versus greater defense spending	62.3%	27.9	9.8	100.1%	(450)	(445.5)

^aFor rational binary preferences as amended, weighted *N* is the total number of full and fractional votes included in the calculation (rounded to the nearest 0.1); *N* is the total number of cases with full or fractional votes included in the calculation. See the Appendix, "Institutional Aggregation of Preferences."

But the United States does not make its budget policy decisions by majority rule. Instead, three different representative institutions, the president, the House of Representatives, and the Senate, must ultimately concur in a budget, and the conflict among the three is an enduring feature of American government. All three institutions represent public preferences, but they do so in different ways. An important way—but by no means the only one—in which they differ is in the voting rules they use to aggregate preferences. The president is the nation's sole plebiscitary officer, the one actor in the legislative process elected by the nation at large. Presidents, therefore, are likely to decide their position by simple majority rule or some variant thereof. The House of Representatives is the nation's parliament, the most partisan of the three legislative actors. It vests the greatest procedural authority in its party leadership, and it elicits the greatest party discipline from the rank-and-file, especially in budgetary matters (Cox and McCubbins 1993; Fenno 1973, chapter 2; Ippolito 1981, chapter 5; Manley 1970, chapters 3, 5; Oleszek 1984, chapter 2; Schick 1980, chapters 4, 7; White and Wildavsky 1989; but cf. Krehbiel 1993). Thus, the House decides its position by parliamentary rule, by the vote of the majority party in caucus. The Senate, finally, is the congress of the nation's states, the one legislative institution whose method of voting is other than popular. With seats apportioned two to each state, the Senate effectively weights citizens' preferences by the inverse of the population of the state in which they reside. For

example, a person's vote in Wyoming (voting age pop. 343,000) is worth 68 times more than a person's vote in California (voting age pop. 23 million).

To depict the institutional differences in preference aggregation, I constitute the individuals in the sample as the president, the House, and the Senate by applying three different voting rules. The president assumes the position of the national majority, voting in referendum.¹⁷ The House takes its preference from the majority vote of those represented by members of the majority party. In the Democratic 103d Congress, the only votes that count are cast by people whose representative is a Democrat, and in the Republican 104th Congress, the only votes that count are cast by people whose representative is a Republican. The Senate, finally, determines its position by weighting votes inversely in proportion to the voting-age population of each voter's home state.¹⁸ (For details, see the Appendix.)

I also explore two models of the way institutions

¹⁷ Alternatively, one might weight voters' preferences by their representation in the Electoral College, that is, by the ratio of the number of electoral votes in their state of residence to the voting age population in their state of residence. The weighting, however, makes a minuscule difference to the distribution of preferences, and so I maintain the simpler aggregation rule in this analysis.

¹⁸ One might add to the model of vote aggregation the Senate's effective supermajority requirement, the 60% of the membership required to invoke cloture. (This is a centerpiece of the analysis by Krehbiel [1996] and Brady and Volden [1997].) I shall not do so explicitly here, although I shall note instances in which outcomes in the Senate might be vulnerable to a filibuster.

TABLE 6. Preferences Expressed Through National Institutions under Two Types of Representation

Institution	Type of Representation	
	Downsian	Partisan
President	All voters	All Democrats
House of Representatives	All voters represented by a Democrat (103d); all voters represented by a Republican (104th)	All Democrats represented by a Democrat (103d); all Republicans represented by a Republican (104th)
Senate	All voters; preferences weighted by inverse of state population	All Democrats represented by Democratic delegations, all Republicans represented by Republican delegations, all voters represented by split delegations; preferences weighted by inverse of state population

represent the preferences of their constituents. In the first analysis, lawmakers are Downsian, and they adopt the positions of the median voter (Downs 1957). In the second analysis, legislators are partisan, and they adopt the positions of the median of their fellow party members (Lewis 1996). Accordingly, the Downsian president represents the national majority; the partisan president represents the majority of Democrats nationwide. The Downsian House represents the voters whose delegates are members of the House majority; the partisan House represents the voters who share the partisan identification of a member of the House majority. The Downsian Senate represents the weighted majority of all voters; the partisan Senate represents the weighted majority of voters who share their senators' party affiliations. Table 6 summarizes the voting rules for each of the six categories, for each of three institutions crossed by two modes of representation.

Applied to the preferences of the survey respondents, the rules yield estimated policy positions for each institution on each of the six budget tradeoff dimensions. They are shown in tables 7 and 8. To economize on presentation, the tables report only the means of the rational binary preferences with one amendment. I assigned -1 to a preference for the tradeoff that favors the option listed on the left, 1 to a preference for the tradeoff that favors the option listed on the right, and 0 to a preference for the status quo over both tradeoffs. Then I applied the institutional voting rules and calculated the means. Each entry, accordingly, may be interpreted as the center of institutional opinion on a policy dimension that ranges from -1 , a unanimous preference for the leftmost option over the rightmost, to 1 , a unanimous preference for the rightmost option over the leftmost. In Table 7, for example, the president, at $-.493$, is strongly in favor of tax reduction through defense cuts but is less enthusiastic than the House ($-.538$) and more enthusiastic than the Senate ($-.415$). Conversely, the House, at $.148$, is more favorable to domestic

spending at the expense of the deficit than either the president (.113) or the Senate (.102).¹⁹

On most budget policy questions, the differences between the positions of the three actors are slight, although they grow a bit more pronounced with the Republican takeover in the 104th Congress (see Table 7). The 103d House, under the control of the Democrats, is consistently the most committed to domestic expenditure; the Senate is consistently the least. Conversely, the Democratic House is distinctly the most enthusiastic about reductions in the military budget, regardless of fiscal purpose; the Senate is distinctly the least.²⁰ In the Senate as in the House, defense cuts are the majority position, but the margin in the Senate is much, much closer, a matter of true consequence when the effective threshold for passage is the 60% required for cloture.²¹ The parliamentary mode of representation in the House amplifies the policy preferences of the liberals who dominated the constituencies of majority Democrats in the 103d Congress, while the federal mode of representation in the Senate magnifies the views of the conservatives who dominated the small

¹⁹ Because the president takes the position of the national median, the means reported in Table 7 are simply the average of the marginals in Table 5. For example, on the tradeoff between tax reduction (-1) and defense spending (1), the president's position (drawing from preferences amended once) is $(-1)(.593) + (0)(.306) + (1)(.101) = -.493$ (with rounding error). On the tradeoff between deficit reduction (-1) and domestic spending, likewise, the president's position is $(-1)(.207) + (0)(.473) + (1)(.320) = .113$. The other means in tables 7 and 8 are computed similarly.

²⁰ This finding seems consistent with more casual observations of the Senate, and it suggests that the Senate's affinity for the military may trace as much to the popularity of defense spending in small states as to the Senate's prerogatives in foreign policy and the historic Republicanism in small states. As explained in the Appendix, however, the NES sampling frame does lend a modest Republican bias to the estimates of the Senate's position.

²¹ The Senate majority for reallocations from defense exceeds three-fifths for all proposals voted with rational binary preferences as expressed in the survey. When amendments are made to preferences, however, the Senate is unable to muster three-fifths for any proposal.

TABLE 7. Institutional Representation of Public Preferences: Downsian Representation

Lower deficits versus greater defense spending	-.489 (.033) (435.0/442)	-.501 (.057) (272.0/276)	-.468 (.044) (435.0/442)	-.489 (.033) (435.0/442)	-.497 (.060) (242.0/246)	-.468 (.044) (435.0/442)
Lower taxes versus greater domestic spending	.176 (.035) (426.0/437)	.211 (.048) (262.0/267)	.161 (.034) (426.0/437)	.176 (.035) (426.0/437)	.076 (.048) (238.0/243)	.161 (.034) (426.0/437)
Lower taxes versus greater defense spending	-.493 (.030) (429.5/434)	-.538 (.059) (265.0/268)	-.415 (.043) (429.5/434)	-.493 (.030) (429.5/434)	-.451 (.059) (243.0/247)	-.415 (.043) (429.5/434)
Greater domestic spending versus greater defense spending	-.525 (.032) (445.5/450)	-.557 (.059) (274.5/277)	-.484 (.043) (445.5/450)	-.525 (.032) (445.5/450)	-.442 (.058) (249.0/251)	-.484 (.043) (445.5/450)

^aFor rational binary preferences as amended, weighted *N* is the total number of full and fractional votes included in the calculation (rounded to the nearest 0.1); *N* is the total number of cases with full or fractional votes included in the calculation. See the Appendix, "Institutional Aggregation of Preferences."

states (Ippolito 1981, chapter 5; Schick 1980, chapter 7; White and Wildavsky 1989).²²

It is no surprise that the relative positions of the preferences of the president, the House, and the Senate are significantly affected by the changeover in partisan control in 1994 (see Table 7). In the 103d Congress, when Democrats reigned over all three legislative venues, Senate preferences tended nearer the *policy* center—the status quo—than presidential and House preferences. In contrast, in the 104th Congress, when Republicans gained control in both chambers, Senate preferences inclined toward the *political* center, between the GOP House and the Democratic president. As envisioned, but for different reasons, the Senate becomes the "balance wheel" of American politics.²³

Partisan representation only amplifies the tendencies apparent in Downsian representation. As seen in Table 8, the Senate's policy centrism in the 103d Congress and its political centrism in the 104th Congress become plainer still when legislators are taken to

be partisans. The upper chamber's position as guardian of the defense budget is more obvious in the 103d, even though it loses its place to the Republican House in the 104th. The GOP cast of the Senate is more evident, even under Democratic control in the 103d and particularly on domestic spending, for which Senate preferences are noticeably more conservative. The House's Democratic leanings toward domestic expenditure and the Senate's Republican inclinations toward defense are even more pronounced when representatives pay heed only to fellow partisans.

The most striking feature of Table 8, however, is the effect of partisan turnover in the House. On every dimension that does not include military spending, the mean position in the Republican House is on the opposite side of the status quo from the mean position in the Democratic House. The affinity for the Pentagon budget increases markedly in the 104th, as Table 9 summarizes, but the change is most conspicuous on domestic spending proposals. The GOP takeover moves the House mean .500 to the right on every domestic spending dimension—one-fourth of the total possible distance (see Drew 1996). In the GOP House, the only winning budget proposals cut defense to reduce the deficit and to lower taxes; the latter passes by the smallest of margins.

American institutions, then, do have consequences for federal budget making, although the consequences

²² Fenno (1966, 581) notes that the overrepresentation of westerners in the Senate made the Department of the Interior a particular favorite of the Senate Appropriations Committee, the opposite of the situation in the House.

²³ Once again, this finding seems consistent with governmental lore dating back to Madison. But a key mechanism of balance in this model—the overweighting of votes in small states—is very different from what Madison had in mind.

TABLE 8. Institutional Representation of Public Preferences: Partisan Representation

Greater domestic spending versus greater defense spending	-.733 (.035) (211.0/212)	-.771 (.082) (146.0/147)	-.617 (.069) (209.3/287)	-.733 (.035) (211.0/212)	-.272 (.074) (135.5/137)	-.586 (.067) (214.8/298)

^aFor rational binary preferences as amended, weighted N is the total number of full and fractional votes included in the calculation (rounded to the nearest 0.1); N is the total number of cases with full or fractional votes included in the calculation. See the Appendix, "Institutional Aggregation of Preferences."

are much more pronounced when the system of separated power joins with partisan representation. Small constituencies and ideologically homogeneous parties together with a parliamentary method of preference aggregation make the House preferences more extreme than those of the Senate or the president. Not just constitutional prerogatives and partisan balances but also the divergent patterns of preference in small and in large states cause the Senate to champion defense expenditure and resist domestic expenditure. Thus, even these "thin" models of multicameral insti-

tutions, even these models of preference aggregation without representation, without elections, without deliberation, and without debate, even these barebones representations of American national legislatures reproduce many of the recent institutional divisions over the budget.

But do the institutions matter? They do, I have shown, affect the distributions of preferences that are aggregated therein, sometimes quite significantly. Yet, are the effects on distributions great enough to affect outcomes, when there is no middle ground between a "yes" and a "no"? They do, but only under some

TABLE 9. The Effect of Partisan Change on Representation: The Republican 104th Congress Compared to the Democratic 103d Congress

Tradeoff Dimension	Difference in Mean of Rational Binary Preferences Amended Once		
	House Downsian	House Partisan	Senate Partisan
Lower deficits versus lower taxes	-.048	-.115	-.035
Lower deficits versus greater domestic spending	-.132	-.548	-.056
Lower deficits versus greater defense spending	-.004	.105	-.005
Lower taxes versus greater domestic spending	-.136	-.494	-.045
Lower taxes versus greater defense spending	.088	.236	.015
Greater domestic spending versus greater defense spending	.115	.499	.031

Source: Tables 7 and 8.

Note: Each entry is the mean policy position for the 104th Congress minus the mean policy position for the 103d Congress. For example, from Table 7, which shows positions under Downsian representation, the House mean on the deficit-tax tradeoff is -.084 for the 104th Congress and -.036 for the 103d Congress; the difference is -.048. From Table 8, which shows positions under partisan representation, the Senate mean on the domestic-defense dimension is -.586 for the 104th Congress and -.617 for the 103d Congress; the difference is .031.

precise conditions. The institutions by themselves, even with their different methods of aggregating preferences, alter distributions of legislative opinion in significant ways, but little more than that. When representation is Downsian, sequential majority voting subject to the same rules as before yields the same outcome in each of the three legislative institutions—a domestic spending increase with a defense cutback—in both the 103d and the 104th Congress.²⁴ When representation is partisan, however, multicameralism and divided control combine to produce gridlock. In the Democratic 103d Congress, the combination of higher social spending and lower defense spending is again the consensus choice among the three legislative actors. In the Republican 104th, however, the House choice—defense cuts to fund deficit reduction—differs from the Senate and presidential choice—defense cuts to fund social spending. The latter proposal could not even pass the GOP House. But at the final stage of the legislative process, the constitutional requirement is unanimity. The president, the House, and the Senate must agree on a budget. Thus, multicameralism, divided government, and partisanship together produce gridlock (cf. Jones, True, and Baumgartner 1997). Without partisanship, separated institutions find agreement, even under divided control, at least with these mass preferences. With partisanship, they do not.²⁵

These conclusions, of course, depend upon the particular distribution of budget preferences in 1995, and the conflicts among American legislative institutions might be greater or smaller with other arrays of mass opinion. An examination of the differences across the six tradeoff dimensions, however, turns up some interesting clues about the ways in which preferences and institutions interact to produce outcomes. As a baseline, first consider some similarities. The differences among legislative actors have been the focus of the discussion so far, but the parallels are at least as remarkable. An important cause of the similarity is the homogeneity of voter opinion in 1995, especially on the tradeoffs that involve defense. The majorities in favor of a scaled back military are so immense that institutional aggregation rules modify them only past the range in which additional votes matter. But an important cause of the similarity is also institutional. The president, the House, and the Senate count votes differently. After all, the institutions of American government were designed with cross-purposes in mind. All the same, they were also intended to be democratic. Consequently, the president, the House, and the Senate count the votes of the *same people*, more or less, and the differences across legislative institutions are bound to be modest, often as not. In a democratic

political system, the variation in the distribution of preferences across popular institutions has a limit.²⁶

Even within this limit, though, preferences and institutions interact to produce differences that are sometimes greater and sometimes smaller. One major factor in the interaction is partisanship. Democrats and Republicans divide most sharply over the proportion of the nation's resources that should be devoted to domestic programs; indeed, the correlations between individual partisanship and the tradeoffs between domestic spending, on the one hand, and deficits, taxes, and defense spending, on the other, averaged $r = .39$ (Hansen 1996, 4–5; see also Citrin 1979; Eismeier 1988; Jacoby 1994; Page and Shapiro 1992, 307–11).²⁷ The consequences of partisan preferences for institutional outcomes are threefold. Two are obvious. First, because elected officials may place greater weight upon the opinions of fellow partisans (Lewis 1996), partisan divisions accentuate the effects of divided control of government. The Republican takeover of the 104th Congress had its greatest effects, in both houses, on the distribution of opinion on tradeoffs with domestic expenditure, as Table 9 shows. Second, because of the parliamentary method of vote aggregation in the House, partisan divisions cause House preferences to diverge more significantly from those of the president and the Senate.²⁸ Third, partisan divisions produce preferences that are more heterogeneous: The only dimensions on which no proposal secures a majority, Table 5 shows, are the two tradeoffs between domestic expenditure and lower deficits or taxes. Heterogeneous preferences amplify the effects of different methods of majoritarian vote aggregation because there are more votes at the margin.

Another factor in the interaction between preferences and institutions is geography. The Senate, for instance, is distinctly favorable to defense spending, partly because of partisanship: In the 103d Congress, the Senate was the most Republican of the three institutions, and the correlations between partisanship and the defense dimensions averaged $r = .21$ (only $r = .13$ leaving aside the tradeoff with domestic spending).

²⁶ A considerable body of research following Shepsle (1979) explores the influence of other legislative rules, and particularly committees, on outcomes. At least for budgetary issues, however, I surmise that the conclusions of this study would stand even with the addition of finer institutional detail. Both earlier work and recent scholarship find that the committees with jurisdiction over the budget—Appropriations, Budget, and Ways and Means—are least likely to comprise “preference outliers.” Party leadership in the House takes considerable pains to ensure that members of these committees are representative of party opinion (Cox and McCubbins 1993, chapter 8; Fenno 1973, chapters 2–4).

²⁷ The stated average summarizes the correlation between partisanship measured on the seven-point NES scale and opinion on tradeoffs measured on the three-point scale shown in Table 5. The individual correlations ranged from $r = .36$ for domestic spending and defense spending to $r = .42$ for domestic spending and taxes. For the tradeoffs that did not involve domestic spending, the largest correlation with partisanship was $r = .15$, for the tax-defense dimension.

²⁸ A corollary is that the greater the partisan homogeneity of congressional districts, the greater this divergence should become, even under Downsian representation.

²⁴ In the Senate, however, the winning proposal is vulnerable to a filibuster that prevents a vote against the status quo.

²⁵ In very broad outline, these findings are consistent with Krehbiel's (1996) contentions that, first, gridlock is a natural consequence of separation of powers and supermajority requirements and, second, the range of policies over which gridlock occurs is wider, the stronger is partisanship.

But its hawkishness also is due to the relative affinity of voters in small states for the military.

Combine these points, and a picture of the interaction of preferences and institutional voting rules begins to emerge, and it sharpens in contrast to the past. As we have seen, the Democratic 103d House had a relative preference for domestic spending, and the Senate had a relative preference for defense, but the "liberality" of the House and the "conservatism" of the Senate are not eternal features, even holding partisan control constant. In the 1950s and 1960s, the Senate was considered the more "liberal" of the two chambers—it routinely approved greater expenditures than the House—and analysts attributed the difference to the more diverse pressures of the more heterogeneous Senate constituencies (Fenno 1966, chapters 10–11; Froman 1963; Manley 1970, chapter 6; but see Kernell 1973). Clearly, the results in this study (and recent experience) indicate that Senate liberality can change. In the House, the people represented by the majority Democrats a generation ago were a more conservative lot than the voters behind the majority Democrats in the 1990s: The House majority in the 1950s and 1960s represented many more rural southerners and many fewer urban northerners. In the Senate, in contrast, the residents of small states were a more liberal group forty years ago than they are now: Democratic strength has diminished in the little sagebrush states and grown in the big industrial states. Thus, as the relationship of mass opinion to partisanship and geography change, preferences and institutions interact to produce different results. The combination of voter preferences and institutional aggregation rules that produced House conservatism and Senate liberality in the 87th Congress produced Senate conservatism and House liberality in the 103d.

The key factors in the interaction between preferences and legislative institutions, then, are the correlations between preferences, on the one hand, and individual partisanship and the size of the state of residence, on the other. This should hardly be a surprise. In this model, I have defined institutions wholly as methods of preference aggregation. Moreover, I have made the rule of vote aggregation distinctive for its partisanship in the House and distinctive for its federalism in the Senate. I have done so for good reason: The House is the American institution that behaves most like a parliament, and the Senate is the American institution that represents states rather than population.

In fact, the events of 1995 suggest that the models reproduce the main outlines of conflict over the budget. In January, Republicans assumed control of the Senate for the first time in eight years and control of the House for the first time in four decades. They immediately filled the agenda with a raft of reforms, including a plan to balance the federal budget within seven years. They met staunch resistance from the president, along lines that parallel these findings. The deep conflict between Newt Gingrich's House and Bill Clinton's White House was exactly over the issues of deficit reduction and domestic spending. Bob Dole's

Senate went along with the House, but it very clearly lacked the fire for the conflict, and most often it watched uncomfortably from the middle (Drew 1996). While the positions of the three institutions were often attributed to the personalities of their leaders (and the obstreperousness of backbenchers), the findings that emerge from these blunt models suggest that the conflict had real political substance. The way the Democratic president represented public preferences caused the White House to put greater priority on domestic spending. The way the GOP House represented public preferences impelled the lower chamber to place greater weight on deficit reduction. And the way the Senate represented public preferences made it the centrist in the budget policy debate (Brady and Volden 1997).

At the same time, the comparison of the model with events also turns up some important discrepancies. The facsimiles of American legislative institutions I have employed sometimes fail to capture noteworthy aspects of the political situation in 1995, but the miscues turn out to be useful. They suggest that other institutions besides legislative institutions put their stamp on policy outcomes, and they provide some clues about which. Consider two questions.

First, why were cuts in the Pentagon budget, which were by far the most popular budget options, "off the table" in 1995 (Drew 1996)? Certainly, there is an array of possibilities that have little to do with public preferences: the perspectives of elites on statecraft, the aversion of national leaders to the risks of underinvestment in the military, and so forth. But the data suggest other possibilities as well. One answer might be that the public's perception of the status quo lags behind changes in policy. The defense budget had borne the brunt of deficit reduction in previous rounds of budgeting, and the bipartisan consensus in Washington was that the Pentagon had already sacrificed enough. The public was probably not fully aware that the "peace dividend" had already been spent (see Bartels 1994). Had it been, lawmakers may well have reasoned, the public would have found the defense status quo closer to its ideal than it imagined *ex ante*. Legislative institutions not only represent voters but also act in their stead.

A second answer points to one of the limitations of single-vote methods of preference aggregation: They ignore intensity. Defense reductions are popular because most Americans would not notice the difference in their life if the government cut its military budget substantially. For the vast majority of Americans, national defense brings only diffuse collective benefit, not direct personal benefit. Employment in the armed forces and defense-related industries is only about 1.6% of the domestic work force, only slightly larger than employment in agricultural production. With no direct stake in defense spending, substantial majorities have low-intensity policy sentiments.

Because defense consumes roughly 4% of GNP, however, it produces highly concentrated benefits for the 1.6% of the work force employed in its production, and the motivational force of concentrated government

benefits has traditionally given industries influence beyond their numbers in national politics. Moreover, the defense industry is highly concentrated geographically, especially in the Southeast and Southwest. The citizens who support defense spending, then, are intense, concentrated, and allegedly advantaged by the arithmetic of the Electoral College. The biggest prize in the presidential race, California, with its 54 electoral votes, has about 12% of the defense employment in the United States (a large amount, although roughly in proportion to its population).

In addition to the two dozen visits Clinton made to the Golden State in the first term of his presidency, the data from the 1995 Pilot Study provide some glimmers of evidence for the Electoral College proposition. Weighting preferences by Electoral College representation made only the faintest difference to the distribution of preferences, on defense spending or anything else, but the "battleground" states in the 1996 election were noticeably more favorable to national defense—or, more precisely, more supportive of the defense status quo—than less competitive states.²⁹ In no case were the differences substantial, but they do suggest that Electoral College mathematics works modestly to the advantage of defense spending. Once again, an institutional method of preference aggregation shapes outcomes in noticeable ways.

Second, why has deficit reduction had such urgency in Washington? This question takes us a little farther. Say what one will about the fits and starts in the battle against the deficit, the truth is that the officers of national government have fought harder than the public preferences revealed here would seem to justify (White and Wildavsky 1989). Although the public would crop defense to balance the budget, Table 5 showed, only about one-third of respondents were willing to sacrifice domestic spending or taxes at the altar of deficit reduction.

One possibility is that the public simply does not understand the implications of the deficit in the same way that it understands spending cuts and tax hikes, and the Burkean trustees in Congress and the White House have intervened for the public's own good. There is nothing in these data to rule out the possibility, but it does entail a more generous view of politicians than Americans have recently embraced.³⁰

The data do suggest a second possibility, namely, that the institutions of national government have amplified the preferences of Republicans and their congressional representatives. Under Democratic control in the 103d Congress, tables 7 and 8 showed, the Senate, the most Republican institution of the three, was the most hawkish on the deficit in opposition to tax cuts. Under Republican control in the 104th Congress, likewise, the GOP House moved so far to the right on

domestic spending that deficit reduction was its preferred use for the savings from cuts in the military.

The Republican aversion to deficit spending has its roots as deeply in the interests of its partisans as does the Democratic preference for domestic spending, and this suggests yet a third possibility. Historically and currently, opposition to deficit spending is greatest among the advantaged, who are less reliant on public provision of goods and services and more invested in the financial assets most threatened by inflation (Hansen 1997; White and Wildavsky 1989, chapter 18). They are also the part of society best able to make themselves heard in democratic politics. As is well known, political participation in America has a class bias upward, a bias that becomes more substantial as political action becomes more organized, more costly, and (presumably) more effective (Rosenstone and Hansen 1993, chapter 8; Schattschneider [1960] 1975; Verba, Scholzman, and Brady 1995, chapter 16). Politicians balance the demands of remote and ill-informed constituents against the preferences of proximate and well-versed elites in the corridors of government, academia, the media, and K Street (White and Wildavsky 1989). In many instances, the advantaged need not even act to influence: Public budget makers rarely stir without first taking the pulse of the financial markets (see Lindblom 1977, Part V). Effectively, then, the preferences of the part of the public that opposes deficit finance are overrepresented in the budget process, in particular, overweighted relative to the egalitarian aggregation formulas I modeled in this analysis.

Table 10 supports the point. It shows the mean policy position when preferences are weighted equally, by schooling, and by dollars. (See the Appendix for details.) They tell a consistent story. When one year of education counts as one vote, the support for domestic spending diminishes, the sensitivity to taxes increases, and the pressure for deficit reduction builds. When one dollar of income counts as one vote, the support for social spending diminishes still further, the sensitivity to taxes increases still more, and the pressure for deficit reduction builds still higher. The twenty-five-year war on the deficit may well bespeak that some preferences in America are weighted more equally than others.

CONCLUSION

For years, the difficulty in bringing the government budget under control has sullied the reputation of democracy. Democratic citizens, say the critics, are simply incompetent; republican institutions, say the critics, are simply incapacitated. As the analysis in this article indicates, however, the diagnosis is not so straightforward. Citizens' preferences over the public budget are remarkably well structured. Most people have no difficulty determining their views. Most have no difficulty recognizing tradeoffs. And most have no difficulty maintaining consistency. The preferences of ordinary Americans are strikingly coherent. American democracy does not want for the competence of its citizens.

The capacities of American institutions are a differ-

²⁹ I defined "battleground" in two ways: the states with the smallest Bush or Clinton plurality in 1992, and the states carried by Bush in 1988 but by Clinton in 1992. The conclusion is slightly stronger with the latter definition.

³⁰ In all fairness to the public, it is not clear that policy experts have appreciably greater understanding of the economic implications of the deficit, although the experts may have different priors.

TABLE 10. The Effect of Weighting Public Preferences by Education and Income

Tradeoff Dimension	Mean of Rational Binary Preferences Amended Once		
	One Person, One Vote (S.E.) (Weighted N/N) ^a	One Year of Schooling, One Vote (S.E.) (Weighted N/N) ^a	One Dollar, One Vote (S.E.) (Weighted N/N) ^a
Lower deficits versus lower taxes	-.059 (.031) (416.5/421)	-.087 (.031) (414.0/419)	-.104 (.032) (386.0/401)
Lower deficits versus greater domestic spending	.113 (.035) (427.5/434)	.063 (.035) (425.0/430)	.007 (.035) (398.5/403)
Lower deficits versus greater defense spending	-.489 (.033) (435.0/442)	-.516 (.047) (433.5/441)	-.546 (.047) (404.5/412)
Lower taxes versus greater domestic spending	.176 (.035) (426.0/437)	.142 (.036) (420.5/430)	.103 (.036) (393.5/402)
Lower taxes versus greater defense spending	-.493 (.030) (429.5/434)	-.503 (.046) (426.5/433)	-.517 (.047) (398.0/404)
Greater domestic spending versus greater defense spending	-.525 (.032) (445.5/450)	-.515 (.044) (442.5/447)	-.485 (.045) (413.5/418)

^aFor rational binary preferences as amended, weighted N is the total number of full and fractional votes included in the calculation (rounded to the nearest 0.1); N is the total number of cases with full or fractional votes included in the calculation. See the Appendix, "Institutional Aggregation of Preferences."

ent matter. As we have seen, the institutional composition of the three legislative actors in American government has put a distinctive stamp on the policy choices of American government. The plebiscitary president, the parliamentary House, and the federal Senate count the same votes, but differently. Depending on the votes they count and the ways they count them, republican institutions are united despite their differences—in institutional structure—or divided despite their similarities—in constituency content. At times, when representation is partisan and government is divided, multicameralism produces conflict; more often, it produces accord. It is important that separated legislative institutions represent the same people *differently*, but it is equally important—if not more important—that they represent the *same people*.

Accordingly, the problem in public budgeting, if there is a problem, lies not in the rationality of public preferences and not in the method of their representation in public institutions. It lies in their content. After all, a major factor in the public's consistency, and in the performance of legislative institutions, is the public's partiality for the policy status quo. From one perspective, the public's affinity for current policy indicates that all is as it should be. Satisfaction with the status quo ensues from a policy process that responds to public preferences (Bartels 1991; Hartley and Russett 1992; Page and Shapiro 1983, 1992; Stimson, MacKuen, and Erikson 1995; Wlezien 1995). People

like what they see because they have gotten what they wanted.³¹

From another perspective, however, the public knows what it wants but is *substantively* mistaken. Its errors are varied: The public underestimates the hazard to the future of financing current consumption with borrowed money; it underappreciates the importance of investment in the physical and economic well-being of its children; it misjudges the power of the economic forces unleashed when the government extracts less from the private economy; and so forth. As much as the democratic faith counsels that the people know best what is best for the people, critics of recent American fiscal practice cannot but conclude that ordinary Americans just have it all wrong.

But current fiscal policy may be popular not necessarily because it is better for the public. It may be popular because people are too conflicted over the values inherent in budgeting to choose one over others

³¹ Among the normative advantages of democratic responsiveness that have not been noted are two suggested by this study. First, responsive policy processes reduce the cognitive demands of judging policy. They produce greater satisfaction with existing policy, and individuals who are satisfied face fewer difficulties in ordering their preferences than do individuals who are not. People who like the status quo in most of its elements have fewer objectives to reconcile. Second, and thereby, responsive policy processes reduce the possibilities for institutional conflict. They promote convergence on incremental policy change.

(Feldman and Zaller 1992; see also Alvarez and Brehm 1995, 1997). People may support the status quo because they apprehend the tradeoffs all too well.

Alternatively, current policy may be popular just because it is familiar. People know what their life is like under the current fiscal regime, but they can only guess what it would be like with lower taxes, higher spending, or smaller deficits. The public may reject superior options out of aversion to risk, as it does in elections (see, among others, Alvarez and Franklin 1994; Bartels 1986, 1988, chapter 4; Brady and Ansolabehere 1989; Quattrone and Tversky 1989).³² People may reject superior options because information about alternatives is costly (Samuelson and Zeckhauser 1988, 33–5). Or they may reject superior options because they cannot identify themselves as winners or losers *ex ante* (Fernandez and Rodrik 1991). Either way, the safety of the status quo and the insecurity of innovation bias people against change. In choices among spending, taxes, and deficits, the devil they know is better than the devil they do not know.

The hope of democratic politics, however, is the possibility that the people may like a new state of affairs as well or better—once they are there.³³ The preferences of the citizens or the procedures of the institutions may hasten or impede, but this is where the capacity of democratic leadership is tested. In a democracy, it is up to those who are convinced that the public is wrong to show the public a better way.

APPENDIX: DATA AND CODING

The data for this study come primarily from the American National Election Study 1995 Pilot Study, conducted by the Center for Political Studies, Institute for Social Research, University of Michigan (Rosenstone et al. 1995). The pilot sample was drawn randomly from respondents to the 1994 NES who had telephones. Of the 704 respondents selected for reinterview, 486 participated. They were interviewed by telephone between August 3 and September 10, 1995. The 1994 sample was selected randomly from the Survey Research Center's national area probability sample.

The twelve budget policy questions and their marginals were presented in Table 1. In administration, they were divided into four units of three. The first set grouped proposals for deficit reduction, the second proposals for tax reduction, the third proposals for domestic spending increases, and the fourth proposals for defense increases. The deficit and tax batteries appeared in close proximity, separated by four questions (plus follow-ups); likewise, the domestic and defense spending batteries appeared nearby, separated by two questions (plus follow-ups). The two pairs of batteries, deficit/tax and domestic/defense, were separated by 60–90 questions, or about 15–20 minutes. (To accommodate split-sample experiments, the Pilot Study instrument was administered in two forms.)

The most difficult issue in the construction of the questions was the wording of the “domestic programs” prompt. We believed we needed a concrete example, and “Medicare, education, and highways” steers a middle course between

representativeness and the potential for reactivity. Education and highways, together with Social Security and health—both closely related to Medicare—are the four largest components of the domestic budget. We felt that “Medicare” was less likely to provoke “hot button” responses than “Social Security.” For more discussion of issues of wording, see Hansen (1995). See also Smith (1987).

For evidence on validation of these measures, see Hansen (1996).

Individual Preference, Indifference, Consistency, and Transitivity

As noted in the text, I examined choices in tradeoff pairs—each policy proposal and its opposite—for strict preference, “indifference,” and consistency. The coding may be summarized as follows:

- accepted the policy “superior *x*, inferior *y*” and rejected “inferior *x*, superior *y*”: strict preference for *x* over *y*;
- rejected the policy “superior *x*, inferior *y*” and rejected “inferior *x*, superior *y*”: strict preference for the status quo policy and (provisionally) indifference between *x* and *y*;
- accepted the policy “superior *x*, inferior *y*” and accepted “inferior *x*, superior *y*”: inconsistency in preference between *x* and *y*.

Taking a pair of rejections to constitute indifference, I compared the pattern of choices over the six pairwise tradeoffs to the 75 patterns of transitive preference orders over the four objects to identify instances of transitivity and intransitivity as well as their nature. For elaboration of the underlying choice theory and a discussion of its assumptions, in particular the assumed convexity of utility functions, see Hansen (1995) and Ordeshook (1986, 33–7).

For intransitive, inconsistent, and incomplete orderings, I made first one amendment and then two, comparing the amended orderings to the 75 transitive orderings. Each amendment altered a single answer to a single question, intervening either to change a “yes” to a “no,” or vice versa, or a nonresponse to a “yes” or to a “no.” Single amendments frequently transformed an intransitive, inconsistent, or incomplete ordering into more than one transitive ordering. One respondent, for example, revealed preference for deficit reduction over all other options, indifference between tax cuts and domestic spending and between domestic spending and defense spending, and strict preference for tax cuts over defense spending. By his answers, he revealed a preference ordering that violates indifference transitivity. But by changing just one survey answer, he could have revealed three different transitive preference orderings. (1) By accepting rather than rejecting lower domestic spending in order to cut taxes, he could have shown a preference for deficit reduction over tax reduction over spending, but indifference between domestic and defense spending. (2) By accepting rather than rejecting smaller defense spending in order to increase domestic outlays, he could have revealed a first preference for deficit reduction, a last preference for defense spending, and indifference between tax cuts and domestic spending. (3) By rejecting rather than accepting lower military spending in order to cut taxes, he could have shown a first preference for deficit reduction and indifference among the three less preferred options. In every analysis that employs “amended” preferences, I have accordingly weighted choices and orderings by the inverse of the number of transitive orderings that are one (or two) amendments away from the answers given. In this example, each choice or ordering was weighted by one-third. Where I have made two amendments to the

³² Fishburn (1970) draws an analytical link between risky choice and apparent indifference intransitivities, which were also prevalent in these data.

³³ Or maybe not; see Fernandez and Rodrik 1991.

answers given, I have ruled out changes that reverse expressed preferences. I do not change a "yes" and a "no" on a tradeoff pair to a "no" and a "yes," and vice versa. Likewise, I do not change an inconsistent response on a tradeoff pair ("yes" and "yes") to an indifference response ("no" and "no").

Institutional Aggregation of Preferences

As noted in the text, institutions are defined as rules for aggregation of individual preferences, and the respondents are the voters whose preferences are subject to the rules. The rules outlined in Table 6 influence outcomes either by excluding subsets of voters or by differentially weighting the preferences of voters. In each case, the valid cases are respondents with "rational binary preferences" over the two options in the tradeoff.

Partisan Representation. Respondents were classified as Democrats, Republicans, or independents from the (standard) partisan identification question, asked in 1995:

Generally speaking, do you usually think of yourself as a Republican, a Democrat, an Independent, or what? [If Republican (Democrat):] Would you call yourself a strong Republican (Democrat) or a not very strong Republican (Democrat)? [If Independent:] Do you think of yourself as closer to the Republican Party or to the Democratic Party?

Coding: Democrats (Republicans) include all who professed Democratic (Republican) identifications in the first question and all who professed independence in the first question but Democratic (Republican) proclivities in the follow-up. The inclusion of independent "leaners" in partisan categories maintained the size of subsamples (just 27 of 486 respondents were "pure" independents) and accords with earlier findings about the political behavior of leaners (Keith et al. 1992).

Majority or President. For each individual i , the vote is

$$\sum_{t=1}^{T_i} \frac{p_{it}s_i}{T_i},$$

where

p_{it} = i 's rational binary preference in the t th amended preference ordering, coded -1 if the preference is for the first option named, 1 if for the second, and 0 if for the status quo;

T_i = number of rational binary preferences that are zero, one, or two amendments away from i 's preferences as expressed (for zero amendments, $T_i = 1$; for one amendment, $T_i \in \{1, 2, 3\}$; for two amendments, $T_i \in \{1, \dots, 6\}$); and

$s_i = 1$ if representation is partisan and i shares the president's partisanship; 0 otherwise.

House of Representatives. The 1995 sample includes respondents from 138 of the 435 congressional districts, with frequencies that range from 1 to 15 per district (median = 3). Because of the tiny size of the congressional district subsamples, and because the district subsamples are not self-representing, I did not aggregate opinion by districts; instead, I aggregated it nationally according to the rules specified in Table 6. Accordingly, for each individual i , the vote is

$$\sum_{t=1}^{T_i} \frac{p_{it}m_i s_i}{T_i},$$

where p_{it} and T_i are defined as before, and

$m_i = 1$ if i 's representative is a member of the House majority party, 0 otherwise; and

$s_i = 0$ if representation is partisan and i does not share her representative's partisanship; 1 otherwise.

The national aggregation works well. In the 103d Congress, Democrats held 60% of the seats; by my measure, 61% of the sample was represented by a Democrat in the 103d. In the 104th Congress, Republicans held 54% of the seats; by my measure, 56% of the sample was represented by a Republican in the 104th.

Senate. The sample includes respondents from 33 of the 50 states, with frequencies that range from 3–47 (median = 12). Again, because of small size and statistical unrepresentativeness of state subsamples, I aggregated nationally using the rules specified in Table 6. For each individual i , the vote is

$$\sum_{t=1}^{T_i} \frac{p_{it}s_i}{v_i T_i d_i},$$

where p_{it} , s_i , and T_i are defined as before, and

v_i = voting age population in i 's state, from *Statistical Abstract of the United States 1996*, Table 459; and

$d_i = 2$ if representation is partisan and i 's Senate delegation includes one senator from each party, 1 otherwise.

For this aggregation, the NES sampling frame happens to have a modest Republican bias, which worsens in the 104th Congress. In the 103d Congress, 34% of the voting age population was represented by a GOP senator; by my measure, 39% of the sample was so represented (counting representation by two Republican senators as 1 and representation by one GOP senator as $\frac{1}{2}$). In the 104th Congress, 48% of the voters were represented by a GOP senator; by my measure, 60%.

Education and Income. Education and income were determined by standard questions asked in 1994. For education, the question read: "What is the highest grade of school or year of college you have completed?" Coding: actual years of education, ranging from 0 to 17, with 17 indicating postbaccalaureate education.

For income, the question read:

Please look at this page and tell me the letter of the income group that includes the income of all members of your family living here in 1993 before taxes. This figure should include salaries, wages, pensions, dividends, interest, and all other income.

Coding: each category was assigned its midpoint in thousands of dollars, with the maximum assigned 112.

For each individual i , the vote is

$$\sum_{t=1}^{T_i} \frac{p_{it}c_i}{T_i},$$

where p_{it} and T_i are defined as before, and

c_i = years of education or thousands of dollars of income.

A New Approach to the Study of Ticket Splitting

BARRY C. BURDEN *Louisiana State University*

DAVID C. KIMBALL *Southern Illinois University at Carbondale*

A new solution to the ecological inference problem is used to examine split-ticket voting patterns across states and congressional districts in the 1988 elections. Earlier studies of ticket splitting used either aggregate data, which suffer from the "ecological fallacy" and threaten individual-level inferences, or survey data from small, unrepresentative samples. We produce more accurate estimates of the proportions of voters splitting their ballots in each state and district, which enables us to examine variations across geographical units. We also clarify the connection between ticket splitting and divided government and test several competing theories about the causes of both. We find, contrary to balancing arguments, that voters are not intentionally splitting tickets to produce divided government and moderate policies. In most cases split outcomes are a by-product of lopsided congressional campaigns that feature well-funded, high-quality candidates versus unknown competitors.

The 1990s have witnessed a flurry of research on split-ticket voting and divided government in the United States (Alesina and Rosenthal 1995; Alvarez and Schousen 1993; Beck et al. 1992; Born 1994; Cox and Kernell 1991; Fiorina 1996; Frymer, Kim, and Bimes 1997; Galderisi 1996; Jacobson 1990). Both are more common features of the political landscape today than in previous periods of American history and thus warrant this scholarly attention. Fifteen of the last 22 national elections have produced divided government; and surveys show that split-ticket voting rates are higher than in previous decades. There is little consensus on what causes ticket splitting. Some researchers argue that it is done intentionally in an attempt to produce the proper mix of policies or keep the political parties in check (Alesina and Rosenthal 1995; Fiorina 1996; Ingberman and Villani 1993). Others believe it is the unintentional by-product of other factors, such as the competitiveness of congressional elections (Jacobson 1997; Kimball 1997), the blurring of ideological boundaries between the parties (Born 1994; Kimball 1997; Soss and Canon 1995), and ballot mechanisms (Beck 1997; Campbell and Miller 1957). Whatever the eventual answer, it is clear that scholars need to rethink voting behavior to produce a theory that explains ticket splitting (Sundquist 1988). Indeed, Fiorina (1996, 129) claims in his definitive *Divided Government* that "ticket-splitting and other aspects of the relationships between

voting for different offices should become a central focus of research."

We take up Fiorina's charge by using a new statistical method (King 1997) to produce more accurate estimates of the direction and magnitude of split-ticket voting in each state and congressional district in 1988. We apply the method to presidential and congressional voting behavior by estimating president/House and president/Senate ticket splitting. The estimates are then used in a series of analyses to compare our ecological estimates to other estimates and to explain why ticket splitting is so common in some places and nonexistent in others. The 1988 elections are an ideal context in which to study split-ticket voting. Unlike earlier periods in American electoral history, which produced divided government during midterm elections, the 1980s witnessed split outcomes in presidential years as well. In fact, it was the simultaneous election of George Bush with the maintenance of the Democratic status quo in Congress in 1988 that interested many researchers in split-ticket voting (Fiorina 1996; Jacobson 1990).

Though this case is theoretically appropriate, inferences about the direction and magnitude of ticket splitting have been hindered because of data limitations. Aggregate measures have been used in the literature for several decades but are flawed by the well-known "ecological fallacy," which refers to the hazards of making individual-level inferences from aggregate data. Survey data also have been used, but national samples are not large enough to make inferences about voting behavior in particular districts. We employ King's technique to produce more accurate estimates of split-ticket voting within districts and states. Unlike earlier studies based on just a few data points (indexed by time), our data set contains hundreds of observations (indexed by district), making it easier to generalize. We demonstrate the validity of these estimates and then combine them with other data to determine what causes American voters to split tickets. We find strong evidence for the contention that candidates—not voters—are primarily responsible for producing divided government. Most variation in the

A longer version of this paper was presented at the 1997 meeting of the Midwest Political Science Association, Chicago, IL. The authors thank Laura Arnold, Larry Baum, Neal Beck, Janet Box-Steffensmeier, Aage Clausen, Morris Fiorina, Paul Frymer, Gary King, Dean Lacy, Herb Weisberg, and Chris Zorn for their comments. We are also grateful to Peter Radcliffe for helping us access FEC data, Jeff Milyo for challenger quality data, and Keith Poole for NOMINATE estimates. The authors contributed equally and are listed alphabetically; correspondence should be directed to the first author. The computer program used in this article is publicly available on the Internet at <http://gking.harvard.edu/stats.shtml>. Data used in the analysis may be obtained from the ICPSR publication-related archive (<http://www.icpsr.umich.edu/cgi/archive/prl>).

extent of ticket splitting across districts and states is not due to policy balancing on the part of voters.

It is worth studying ticket splitting at the district and state level because election outcomes are determined within these electoral units (Wright 1989). Voters within these geographical boundaries, not the national population, determine the composition of Congress and the Electoral College. Our approach allows us to link ticket splitting directly with divided government because we can compare levels of ticket splitting to the election outcome in each state or district.

USING ECOLOGICAL INFERENCE TO STUDY TICKET SPLITTING

Given the ubiquity of divided government in American national politics, it is important to understand how many voters split their ballots and why. Accurate estimates will help us understand the extent to which divided government is the will of the voters. Why voters split tickets is a continuing research question in studies of electoral behavior. Unfortunately, the data used to answer the question have not been up to the task. Here, we consider the two traditional approaches—using individual survey and aggregate election data—and demonstrate why the new method is an improvement.

In addition to King's method, several other techniques developed in political science, sociology, statistics, and other fields may be helpful in drawing individual inferences from aggregate data. Perhaps the earliest is the "method of bounds" (Duncan and Davis 1953), which uses a deterministic relationship between aggregate quantities to narrow the range of possible values of the individual-level parameters of interest. Some have applied that method while adding external assumptions or substantive knowledge to narrow even more the logical bounds around the individual-level parameters (Achen and Shively 1995; Shively 1991; Sigelman 1991). The most commonly used ecological inference method is probably Goodman's (1959) regression technique. Though Goodman warned against its use, one may estimate individual-level parameters through simple linear regression, assuming that the parameters do not vary across districts (or vary randomly across districts around their global values).

Approaches to the ecological inference problem have become remarkably complex since that time. Achen and Shively (1995) survey the latest techniques, many of which allow for some relaxation of Goodman's constancy assumption or incorporate other substantive assumptions about the individual-level parameters and their relationships with aggregate-level variables. Most of these techniques estimate only one global set of individual-level parameters, however, not a pair for each electoral district, which is essential for our purposes. King's method provides district-level estimates of the quantities of interest and the uncertainty associated with them without making unreasonable assumptions about the constancy of the parameters we are estimating. It also permits us to work *between* the individual and aggregate levels of analysis, which helps

us link ticket splitting to split-party election outcomes. In addition, while others have noted a connection between the method of bounds and Goodman's regression (Achen and Shively 1995), King's approach may be the first to combine the insights of both earlier methods.

Individual Data

As with other voting studies, analyses of ticket splitting rely primarily on survey data. The National Election Study (NES), for instance, routinely asks a sample of Americans how they voted in the most recent elections. These data have been informative for examining the national trend in ticket splitting over the last 45 years and some of its determinants. A serious problem is that one cannot decompose national survey samples into smaller units of aggregation, such as states or voting districts, because of the number of cases required for such an analysis (Voss, Gelman, and King 1995). The NES interviews about 2,000 people each election year; so relatively few respondents come from each state, and even fewer are drawn from any given House district. This makes estimates inefficient, if they are possible at all. Furthermore, a representative national sample usually is not representative of voters from each state or congressional district (Westlye 1991).¹

Compounding the problem is the potential for inaccurate reports of voting behavior in surveys (Abramson and Claggett 1986; Campbell et al. 1960; Silver, Anderson, and Abramson 1986; Wright 1993). Proportions based on survey data are only unbiased if respondents report their voting behavior accurately.² For example, researchers have pointed out that the NES overstates support for the winning (Wright 1990) and incumbent (Eubank and Gow 1983; Gow and Eubank 1984) congressional candidates.³ This is due either to forgetfulness over time, social desirability pressures, or a question wording artifact (Box-Steffensmeier and Jacobson 1995; Jacobson and Rivers 1993; Wright 1990). Others argue that surveys tend to overstate voter turnout (Abramson and Claggett 1986; Campbell et al. 1960; Silver, Anderson, and Abramson 1986). Thus, a study of voting data at an aggregated level is a worthwhile supplement to self-reported voting patterns derived from surveys.

¹ Some may advocate the use of exit polls to estimate ticket splitting within each state and district, but these usually do not include data to parcel respondents into congressional districts, and until recently many exit polls did not ask people to report their House vote. In any event, the representativeness of respondents in exit polls is frequently in question (Asher 1995).

² Technically, estimates may be unbiased if reporting errors are random. Systematic misreporting in a particular direction induces bias.

³ To the extent that incumbency contributes to ticket splitting (Alvarez and Schouzen 1993; Born 1994), a proincumbency bias means that the NES may overestimate the extent of split-ticket voting in national elections in the 1980s (Wright 1990).

TABLE 1. Voting in Maryland's Sixth Congressional District, 1988

Presidential Voting Decision	House Voting Decision			Total
	Byron (D)	Halsey (R)	Abstain	
Dukakis (D)		<i>Dukakis splitters</i>		82,781
Bush (R)	<i>Bush splitters</i>			158,808
Total	166,753	54,528	20,308	241,589

Aggregate Data

Aggregate election data also have been used to examine split-ticket voting. Burnham's (1965, 1970) comprehensive analysis of American political realignments cites ticket splitting as a sign of large-scale political change. His operationalization of split-ticket voting is the simple difference between the highest and lowest Democratic percentage of the two-party vote among races within each state. Burnham admits that his indicator is "measured rather crudely," although it was one of the best available at the time. As is well known, the problem with such a measure is that making individual inferences from aggregate data may lead to false conclusions. Furthermore, Burnham's method can only estimate total ticket splitting, not its direction; the method cannot distinguish those who select a Republican president and a Democratic congressional candidate from those who choose a Democratic president and a Republican for Congress.

Rusk (1970) uses the same aggregate measure while pointing out two of its flaws. First, "it would not detect mutual crossovers between the two parties" (p. 1224); second, differences in the type of election being held in the states the same year threaten interstate comparisons, a problem Rusk calls the "race composition factor." The latter is a concern, but consider the more immediate ramifications of mutual crossover. Even if two states have the same contests on the ballot, Burnham's measure understates ticket splitting, since ballots split in opposite directions cancel out one another. For instance, a value of zero may mean that no split-ticket voting occurred (as Burnham and Rusk assume) or that every voter is casting a split ticket. The truth is likely to lie somewhere in between. Much may be happening at the individual level, but aggregate data cannot reveal it, a consequence of the ecological fallacy that has plagued social science for decades (King 1997; Robinson 1950).

Another aggregate technique relies on the two-office split result, which assumes that a difference in party outcomes for two offices in the same district is evidence of widespread ticket splitting. The increasing proportion of congressional districts with split results in presidential and House contests is used to infer that ticket splitting has increased over time (Cummings 1966; Fiorina 1996). But Feigert (1979) shows that this technique can produce inaccurate estimates and instead finds a high correlation between split districts and ballot roll-off.⁴ Below, we show that once the direction

of ticket splitting is properly estimated, there is a conditional relationship between split-ticket voting and split outcomes.

With the development of a solution to the ecological inference problem, we can produce district- and state-level estimates of the proportion of voters casting split ballots that avoid the problems described above. Since we use aggregate data, survey misreporting is not a concern; only collective (and anonymous) votes are needed. In addition, King's method allows us to account for both types of ticket splitting, thus avoiding the crossover problem in previous aggregate measures. Before turning to the estimation itself, we briefly describe the ecological inference problem.

The Problem as a 2 × 3 Contingency Table

The general ecological inference problem may be conceptualized as a standard contingency table with missing data. The marginals of the table are known, since they are based on aggregate data, but the cell percentages are unknown (King 1997; Markus 1974). Table 1 lays out the ecological inference problem in estimating ticket splitting, using 1988 congressional election results from Maryland's Sixth District as an example. We choose this district for illustration because it produced a split-party result that matched the national pattern: a Republican (George Bush) at the presidential level and a Democrat (Beverly Byron) at the congressional level. Since the presidential contest usually appears at the top of the ballot and is the more visible race, we assume that voters make their presidential choice first. Voters then have three options in the congressional races that appear farther down the ballot: (1) vote Democratic, (2) vote Republican, or (3) abstain.⁵ From election returns we know how many voters in Maryland's Sixth District chose Bush in the presidential contest (158,808), and we know how many voters selected Byron, the Democratic candidate for the House (166,753), but we do not know how many of the Bush voters split their ballot by also selecting Byron. Presumably, this was common, since each candidate carried the district by a hefty margin. We do know that the number of Bush voters who split their ballot ("Bush splitters") is between 83,972 (the Byron

valid methods did not exist at the time. While ecological inference techniques have been used to examine the extent to which voters switch parties from one election to the next (Achen and Shively 1995; Gosnell 1937), to our knowledge no one has used these techniques to study ticket splitting.

⁵ We ignore votes for third-party candidates. Few voters chose such candidates in 1988.

⁴ Feigert (1979) actually recommended the use of ecological inference techniques in further study of ticket splitting but lamented that

total minus the Dukakis total, or .528 of all Bush voters in the district) and 158,808 (all Bush voters), a wide interval. Similarly, we have reason to believe that slightly more than 20,000 presidential voters "rolled off" by not casting a vote in the House race, but we do not know whether abstention in the House contest was more prevalent among Bush or Dukakis voters.

Our estimation of ticket splitting is a two-stage process that divides Table 1 into two 2×2 tables that are analyzed sequentially for every district. First, we estimate the fraction of Dukakis and Bush voters who also cast a vote in the House contest (or the proportions that do not fall in the "Abstain" column). Those estimates are then combined with the other known aggregate information to estimate ticket splitting ("Bush splitters" and "Dukakis splitters").⁶ It is important to control first for ballot roll-off in the congressional contest, because voters who abstain from that race cannot split their ballot. In addition, if there are partisan differences in roll-off, then aggregate measures of ticket splitting that fail to account for roll-off are biased.⁷

When discussing our estimates of split-ticket voting, we will use a two-letter abbreviation to indicate the four possible voting patterns; the first letter is the party of the presidential candidate chosen, and the second letter is the party of the congressional candidate chosen. For instance, an RD voter is one who voted for Bush and the Democratic congressional candidate.

DATA AND METHOD

The main data set consists of only the number of votes received by the presidential, House, and Senate candidates in each congressional district or state (from Barone and Ujifusa 1989) to provide the known quantities in Table 1.⁸ Voters in 1988 could have split their ballot in one of two ways: Bush and a congressional Democrat, or Dukakis and a congressional Republican. "Bush splitters" denotes the former, and "Dukakis splitters" denotes the latter. Ultimately, we are more

interested in Bush splitters because of the divided government pattern of the 1980s.⁹

The first run included only presidential and House data, with 74 uncontested House races excluded from the procedure. In the uncontested districts, voters only had one choice for the House; the exclusions do not affect the estimates for the other districts. In addition, a South dummy variable was used as a covariate to account for possible aggregation bias and to improve the estimates. Because the degree of split-level partisanship in the South is unique, we suspect that aggregating votes may conceal more ticket splitting in the South than elsewhere. The second run produced estimates of president/Senate ticket splitting within states. Since there were only 33 Senate races in 1988, estimates based on so few observations would be inefficient. Thus, the House data were included to improve the Senate estimates.

Our estimates reveal that ticket splitting varies substantially across districts and states, even within the same election year. After removing the uncontested House races, the proportion of Bush splitters in a district ranges from .03 to .90, with a standard deviation of .19. The proportion of Bush splitters was under .1 in 23% of the districts, but it exceeded .5 in 27.3% of the districts. There was less variation in the district-level fraction of Dukakis splitters, which ranges from .02 to .72, with a standard deviation of .14. The proportion of Dukakis splitters was under .1 in 42.1% of the districts and above .3 in 29.6% of the districts. The relationship between the two types of ticket splitting is negative and strong ($r = .94$); in districts with many Bush splitters, there were few Dukakis splitters. Nevertheless, some form of ticket splitting was quite common in many congressional districts in 1988.

Because these are maximum likelihood estimates, King's method also produces standard errors for the two ticket-splitting parameters for each congressional district. In this case it yields fairly precise estimates of ticket splitting. The mean standard error of our district-level estimates for Bush splitters is .04, while for Dukakis splitters it is .05. Thus, traditional 95% confidence intervals drawn around our estimates would cover a range of about 15–20 percentage points.

THE VALIDITY OF OUR ESTIMATES

The Relationship between Split-Ticket Voting and Divided Outcomes

Does ticket splitting matter if only a minority of voters are involved? Can a small proportion of voters who split their ballot produce divided government? Are higher levels of ticket splitting associated with split outcomes when votes are aggregated at the district level? Table 2 provides the mean level of each type of

⁶ With King's *Ezi* program (version 1.21), we used the EI command to make the first-stage estimates and the EI2 command to make the second-stage estimates. See King (1997, chapter 15) and the Appendix for a more detailed description of this method.

⁷ According to our estimates, Democrats were somewhat more likely than Republicans to abstain from the House contest. In addition, ballot roll-off was quite high in some congressional districts, especially if an incumbent ran unopposed or faced token opposition. As it turns out, our ticket-splitting estimates did not change substantially when we did not control for ballot roll-off. For an example that controls for roll-off in studying racially polarized voting, see Palmquist and Voss (1996).

⁸ Eleven districts (from Arkansas, Florida, Louisiana, and Oklahoma) that featured uncontested House races were excluded from our analysis because election totals were not available. The state either did not put the House contest on the ballot (as in Louisiana when a candidate won a majority of the vote in the open primary) or did not tabulate the House vote in these districts. Survey respondents from these districts (61 total) were dropped from the 1988 NES sample for the comparisons of ticket-splitting estimates presented here. The Appendix offers a brief description of King's ecological inference method.

⁹ The RD pattern of national government common in the 1970s and 1980s is remarkable. Indeed, according to Fiorina (1989, 140), "the emergence of a two-tier system in which Republican presidential majorities coexist with Democratic congressional majorities is the single most important feature of contemporary politics."

TABLE 2. Mean President/House Ticket Splitting by District Outcome, 1988

Ticket-Splitting Type	District Outcome			
	RR	RD	DR	DD
Bush splitters	.11 (.08)	.57 (.24)	.09 (.05)	.59 (.24)
Dukakis splitters	.41 (.22)	.09 (.06)	.43 (.13)	.07 (.05)
Number of districts	163	135	12	125

Note: Standard deviations of the point estimates are in parentheses.

President/House ticket splitting in different types of districts in 1988. Ticket splitting by Bush voters is quite high (.57) in districts that chose Bush and a Democrat but low (.11) in RR districts. Nevertheless, ticket splitting and divided outcomes are not entirely synonymous, though they are sometimes treated as such. Substantial numbers of voters split their ticket even in districts where candidates of the same party are elected. For example, .59 of Bush voters (on average) split their ticket in DD districts. Notice that Dukakis splitters are most common in DR and RR districts, and Bush splitters are most frequent in RD and DD districts. In accord with the argument we make below, this suggests that the primary determinant of ticket splitting is the local congressional race, not a national mandate for split control.

Consider that Bush can be expected to defeat Dukakis in more conservative districts. When a Democratic congressional candidate wins in such a district, it is likely due to a high rate of ticket splitting among Bush voters. If divided outcomes and split-ticket voting were unrelated, then one would expect no connection between the fraction of Bush splitters in a district and an RD election result.

To test this connection, we examine the relationship between the level of ticket splitting among Bush voters and the probability of districts having a unified Republican electoral outcome (RR) or a divided outcome (RD). The estimation is a logit model in which the dependent variable is the probability of selecting a Democratic congressional candidate, conditional on the selection of a Republican for president. The results, found in Table 3, show that the relationship between ticket splitting among Bush voters and the election of a Democrat to the House is remarkably

TABLE 3. Logit Equation Predicting Divided Outcomes (RD versus RR Districts) by Split-Ticket Voting

Variable	<i>b</i>
Bush splitters	63.84*** (16.29)
Constant	-18.71*** (4.77)
<i>n</i>	298
Correctly predicted	98.3%
Log-likelihood	-11.82

Note: Standard errors are in parentheses. ****p* < .001, two-tailed *t* test.

strong. The classification rate of the one-variable model improves upon the naive baseline significantly, mispredicting less than 2% of districts based only on our knowledge of ticket splitting among Bush voters. The logit equation predicts that if more than .29 of the Bush voters split their ballot, then there is a better than 50% chance that the district will elect a Democrat to the House. Thus, both the direction and frequency of ticket splitting determine divided outcomes. This strong association between divided outcomes and our estimates of ticket splitting further validates the use of King's method in this case.

Comparisons with Individual Estimates

It is useful to compare our ecological-based estimates with those from a more traditional individual-level source. Table 4 presents both for a quick comparison, along with estimates using Goodman's regression to show how much we improve on previous ecological inference methods. Using the 1988 NES, the estimated proportion of Bush voters who also chose a Democrat for the House (Bush splitters) is .341, as compared to our estimate of .331. The corresponding proportion of Dukakis splitters is a little less than half that, at .151, as compared to our ecological estimate of .198. At the national level our ecological estimates of ticket splitting are close to those produced by the NES, with smaller standard errors to boot. The NES estimates have standard errors of about .025, or 2.5%, so the 95% confidence interval around the national point estimates includes our estimates, making them statistically indistinguishable.

For the 33 Senate races in 1988, split-ticket voting was about as common as in the House contests. Roughly one in three Bush voters chose a Democratic Senate candidate, and about one in five Dukakis voters chose a Republican for the Senate. To compare the ecological estimates with individual data, we estimated split-ticket voting from the 1988 Senate Election Study (SES), which drew representative samples of about 75 people from each state with a Senate race that year. As Table 5 indicates, the ecological estimates of president/Senate ticket splitting are a bit lower than those produced by the SES, but we did not weight the SES data by state population, which may explain why those estimates are higher. Also, small states (where ticket splitting was more common in 1988) are overrepresented in the SES. Finally, while the Goodman estimates are close to the other two in this case, the large standard errors indicate a high level of uncertainty in the Goodman estimates.

EXPLAINING VARIATION IN TICKET SPLITTING ACROSS DISTRICTS AND STATES

In the previous section we found tremendous variation in ticket splitting across congressional districts and states. In this section we attempt to explain why split-ticket voting is more common in some electoral units than in others. We present results of multivariate

TABLE 4. Three Estimates of President/House Ticket Splitting, 1988

Source	Proportion Splitting Ballots		
	Bush Voters	Dukakis Voters	All Voters
Ecological estimate	.331 (.006)	.198 (.007)	.271
NES estimate	.341 (.021)	.151 (.016)	.254
Goodman estimate	.033 (.032)	-.108 (.037)	.018

Note: Standard errors are in parentheses.

analyses using our district and state point estimates of split-ticket voting as dependent variables. Our analysis provides a direct comparison of competing theories of split-ballot voting.

On the one hand, intentional theories are based on the notion that some voters prefer divided government and pursue it. Ideological moderates purposely vote for presidential and congressional candidates of different parties so that the separate branches of government will check each other (Alesina and Rosenthal 1995; Erikson 1988; Fiorina 1996; Jacobson 1990). Thus, split-ticket voting is consciously used to produce divided government. Some survey respondents claim that they prefer divided to unified control of government (Fiorina 1996). Ticket splitting may be a viable strategy for balancing the extreme positions of opposite party candidates, thereby producing moderate policies favorable to the median voter.

On the other hand, unintentional theories posit that split-ticket voting is a by-product of other forces, such as weak partisan attachments (Petrocik and Doherty 1996), ballot mechanisms (Beck 1997; Campbell et al. 1960; Campbell and Miller 1957), and the level of competition in congressional contests (Jacobson 1990). The lack of intention is attributed only to voters; candidates play an important role in producing split-ticket voting. For example, Bush voters in a district with an unchallenged Democratic candidate for Congress in 1988 have little choice but to vote for the Democrat or abstain. Furthermore, as party attachments in the electorate have weakened, campaigns have become more candidate centered (Wattenberg 1991), making it more likely that voters will choose candidates from different parties, even if not motivated by the specific goal of divided government. Jacobson (e.g., 1997) demonstrates that well-funded candidates with previous political experience are most adept at attracting voters from the opposite party. Voters simply may select the most visible or most appealing candidate for each office; given the low level of competition in many congressional contests, this decision rule often leads to ticket splitting.

Since the direction of ticket splitting is important in determining the election outcome, we treat the two types of ballot splitting (RD versus DR) separately. We estimated two linear regression equations to determine the factors that influence the fraction of Bush voters who select a Democrat for Congress and the fraction of Dukakis voters who select a Republican for Congress, using states or districts as our units of analysis. We focused most of our attention on RD splitting, since the 1988 election produced a Republican president and a Democratic Congress. We included two explanatory variables to account for the nature of the congressional campaign. One is a dummy variable for the party of the incumbent, who often develops a personal bond with constituents that crosses party lines (Fenno 1978). We expect that RD ticket splitting will be higher in contests with a Democratic incumbent and that DR splitting will be more common when the incumbent is Republican. The other variable is a measure of the Democratic candidate's spending as a fraction of total spending in the congressional contest. Campaigns are contests of competing messages crafted to attract voters, and the spending variable measures the extent to which the Democrat's campaign message is dominating that of the Republican. In addition, the spending measure allows us to control for the fact that campaign costs vary from one district to another. We expect that campaign spending will be positively associated with RD ticket splitting and negatively associated with DR splitting.

We also included a dummy variable for districts or states in the South. Since World War II, the South has supported Republican presidential candidates and Democratic congressional candidates more often than the rest of the country. Frymer (1994) and Frymer, Kim, and Bimes (1997) argue that RD ticket splitting has been more common in the South because Democratic candidates for Congress have been able to position themselves toward the conservative end of the ideological spectrum, thus capturing the support of many Republican presidential voters. It is argued that

moderate to conservative voters use simple proximity decisions to select congressional Democrats and presidential Republicans. We likewise expect RD ticket splitting to be more common in the South.

It has been suggested that ticket splitting is less common in states with a straight-party option on the ballot (Beck 1997; Campbell and Miller 1957; Rusk 1970). As Campbell et al. (1960, 275) note, "any attempt to explain why the voter marks a straight or split ballot must take account of the physical characteristics of the election ballot." They found that split-ticket voting was about 8% higher in states without a straight-party option in the 1950s. In 1988, 20 states had a ballot that allowed voters to pull one lever or check one box to vote a straight ticket (Brace 1993). Thus, we included a dummy variable for states with a straight-party option, and we expect it to be negatively associated with both types of ticket splitting.

The intentional theories offer few hard predictions, but Fiorina (1996) presents a clear hypothesis. Based on a simple spatial voting model in which moderate voters are located between an extremely conservative Republican Party and an extremely liberal Democratic Party, he finds that classic proximity voting may no longer be rational when candidates are far from a voter's ideal point. Instead, candidates from opposite parties are chosen for different offices so that they will be required to compromise and produce moderate policies after taking office. A key tenet of this argument, which Fiorina says is "probably the most important point," is the following prediction: "When the parties are relatively close, near the center of gravity of the electorate, ticket-splitting declines. When the parties move away from each other . . . they open up a large policy range in which ticket-splitting is the voter response" (Fiorina 1996, 81).¹⁰

We have a unique opportunity to test this hypothesis

with available Senate data. The SES asked voters in states with Senate races to place the presidential and senatorial candidates on a seven-point ideological scale.¹¹ Taking the mean placements of the four candidates in each state, we computed the mean distance between Bush and the Democratic Senate candidate. Based on the prediction from Fiorina's balancing perspective, we should find a positive relationship between this distance and RD voting. In other words, RD ticket splitting should increase as the distance between Bush and the Democratic Senate candidate increases.

Table 6 presents regression results using RD ticket splitting as the dependent variable. The first column reports traditional ordinary least squares (OLS) estimates and the second column presents weighted least squares (WLS) estimates to account for the differing standard errors associated with our point estimates of ticket splitting.¹² In the WLS analysis, observations are weighted by the inverse of these standard errors, thus giving greater weight to observations with more precise estimates of ticket splitting. Because OLS and WLS produced similar results, we retained the OLS estimates because of their intuitive interpretations. The final column reports standardized OLS coefficients to assess the relative effects of the explanatory variables. Just a few independent variables do an impressive job of explaining variation in ticket splitting. Though parsimonious, the OLS model explains 86% of the variation in the President/House results and 68% of the variance in the President/Senate results.¹³ This amount

¹⁰ Fiorina models voter behavior as if it were conscious. Our test appropriately examines voter behavior without peering inside the "black box" to check the assumptions about process.

¹¹ "Unless we have data on both the Democratic incumbent and her Republican challenger, and unless we can put the presidential candidates and the voters on the same scale, we cannot differentiate among such different situations and hence decide whether ticket-splitting is consistent with an ideological consistency or ideological balancing model" (Fiorina 1996, 155). The SES data satisfy these criteria.

¹² The substantive results are unchanged if two-sided tobit models are estimated to account for a dependent variable censored at zero and 1.0.

¹³ The Senate analysis is based on 32 states because the 1988 SES did

of explained variance is high in comparison to other voting behavior models but is especially surprising given that the dependent variable is merely a point estimate based on ecological data.¹⁴

The House and Senate equations differ only in that the Senate includes a measure of ideological distance between Bush and the Democratic senatorial candidate. Note that its coefficient is negative and statistically insignificant. The lack of significance is likely due to the small number of cases (*n* = 32) and corresponding degrees of freedom since the zero-order correlation between RD ticket splitting and the ideological difference between the candidates is $-.370$ ($p < .05$). Contrary to the balancing hypothesis, this means that RD ticket splitting does not increase as the parties polarize and that it may actually decrease. Split ballots are most common when Bush and the Democratic candidate are nearest each other, blurring their ideological differences enough to make partisan considerations in voting behavior less important (Frymer 1994; Kimball 1997). This finding fits with the Downs (1957) expectation that, in an attempt to win votes, party platforms will be ambiguous and overlapping.

In the House equation, RD voting is more common in the South. According to the OLS results, about 5% more Bush voters chose the Democratic House candidate in the South than elsewhere. Assuming for the moment that Democratic candidates are relatively conservative in the South, the distance between their position and that of Bush should be relatively small (Frymer, Kim, and Bimes 1997). Despite this, ticket splitting is higher, not lower. Again, intentional theo-

ries that attribute ideological balancing motives to split-ticket behavior are not supported.

The other variables in the equation are all significant and have the expected signs. The presence of a Democratic incumbent boosts RD ticket splitting by roughly ten percentage points in both House and Senate contests, holding other variables constant. Furthermore, a straight-party ballot mechanism decreases RD splitting about three percentage points in the House races and almost seven percentage points in the Senate contests. The greatest influence by far, however, is campaign spending. Recall that this variable is operationalized as the Democratic proportion of all congressional campaign spending. The OLS coefficient of .35 indicates that a Democratic House candidate who matches the Republican opponent dollar for dollar can increase RD ticket splitting by a whopping 17.5 percentage points over a Democrat who spends no money on the campaign. The parameter estimate of .29 in the Senate equation indicates that a Democratic senatorial candidate who matches the Republican opponent in spending will increase RD voting by nearly 15 percentage points over a Democrat who spends no money on the campaign. Furthermore, the relative effect of spending is overwhelming, as the standardized regression coefficient is roughly twice as large as that of the next most important variable.¹⁵

not obtain candidate placement information from Nevada respondents.

¹⁴ One may argue that our ideological distance measure will not work properly if both Senate candidates fell on the same side of the median voter in a particular state. Using the SES, however, in almost every state the mean ideological placement for respondents fell in between the mean placements of the two Senate candidates (Erikson 1990).

¹⁵ One may object that we have not accounted for the effect of the presidential candidates on ticket splitting. It is possible that some voters defect from their identified party in the presidential contest. To control for the presidential contribution, we included Bush's fraction of the vote in the regression models presented here. This did not improve the fit of the models and did not alter the effects of the other variables. In addition, it produced substantively weak and inconsistently signed regression coefficients. For example, the Bush variable had a positive coefficient ($p = .03$) in the first House model in Table 6, but a negative coefficient ($p = .24$) in the first House model in Table 8. The effect in Table 6 (although substantively small) suggests that Bush contributed to ticket splitting by attracting some Democratic votes.

Before exploring this finding, let us consider a similar regression, shown in Table 7, in which the dependent variable is the fraction of Dukakis voters who chose a Republican congressional candidate. The independent variables remain the same except that ideological distance is now measured between Dukakis and the Republican senatorial candidate, and the incumbency dummy now denotes a Republican. The analysis again points to the importance of the candidates in the congressional contest. For example, a Republican incumbent increases DR voting in House contests by about nine percentage points, other things being equal. In addition, spending remains the most critical factor, whether judged by the standardized coefficient or substantively, by interpreting the unstandardized coefficient. As a Republican candidate's share of total congressional campaign spending goes from zero to 100%, DR ticket splitting increases by about 25 percentage points in the House contest and about 23 percentage points in the Senate race. That is, the percentage of Dukakis splitters may jump by more than 20 points based on congressional spending patterns alone. Certainly, campaign spending is a proxy for other factors, such as the relative quality and experience of the candidates, but it also is critical to ticket splitting. Candidates spend most of their funds on advertising to increase their visibility and emphasize positive, familiar images in the minds of voters (Herrnson 1997; Jacobson 1997). To the extent that a congressional candidate can dominate advertising and frame the campaign, s/he will attract more votes from the opposite party.

With regard to the Senate, as in Table 6, the results for ideological distance in Table 7 reveal that this is not a statistically significant influence on DR ticket splitting. In our model, increased distance between Dukakis and the Republican senatorial candidate does not produce more ticket splitting, contrary to predictions of the balancing perspective. Furthermore, DR voting is no more common in the South than in other regions of the country. The South in the 1980s was unique for one type of ticket splitting: a Republican for president and a Democrat for Congress. Finally, while a straight-party ballot option reduced RD ticket splitting in both Senate and House races, it did not have a noticeable effect on DR outcomes in 1988.

A more interesting setting may be the House elections. After all, government was divided along president/House lines throughout the 1980s, while both Senate and White House were controlled by Republicans for six years. It is more difficult for voters to split government control using their Senate vote, because there are only 33 races in a given election year. Our test of ideological balancing in presidential and senatorial elections did not support intentional theories, but comparable survey data were not available for the House. Instead, we used ideological scores for Democratic incumbents, since Democrats were a large majority in 1988, although this necessarily limits our test to RD splitting.¹⁶ Our measure is the Poole and

Rosenthal (1997) NOMINATE score, which is based on statistical analyses of roll-call voting.¹⁷ In contrast to the SES data, based on citizen surveys, NOMINATE is more clearly exogenous to the vote decision. We used first-dimension point estimates from the 100th House to measure the ideological position of incumbent candidates. Values range from -1 (most liberal) to +1 (most conservative). If voters are more likely to split their ballot when the parties are polarized, then the ideological position coefficient ought to be negative. In other words, if motivated to balance extreme positions, then Bush voters would be more likely to split their ticket for a liberal than a conservative Democratic House candidate.

We included this ideology measure in a regression equation similar to the ones in tables 6 and 7, except that the incumbent dummy was removed by necessity. We also added a dummy indicating the presence of an "experienced" Republican challenger in the House contest (one who previously had held elective office or had run for a House seat). Table 8 reports the results. Though spending remains the most important influence on RD voting, the extremism of the Democratic incumbent plays a part as well. The coefficient is

sponded to the election of Bush and a Democratic House. When we examined DR splitting, the results were similar to those presented in Table 8: Ticket splitting by Dukakis voters was more frequent in districts with a Republican incumbent toward the liberal end of the spectrum.

¹⁷ NOMINATE is a maximum likelihood technique that uses roll-call data ("yeas" and "neans") to estimate the ideal points of legislators. It is based on a multidimensional spatial model in which legislators take roll-call positions that are nearest their ideal point with some error, thus making it probabilistic (Burden 1997). As is common practice, we use first-dimension NOMINATE scores, which explain more than 80% of the variance in roll-call voting patterns. Furthermore, we use a particular dynamic variant, D-NOMINATE. Substantive results are no different if other forms of NOMINATE are used; they correlate with one another at well above .95. See Poole and Rosenthal (1997) for a comprehensive review.

¹⁶ RD splitting was the more common form in 1988 and corre-

FIGURE 1. Split-Ticket Voting by House Campaign Spending.

positive and significant, indicating that the proportion of RD voters increases in accord with Democratic conservatism. Assuming that Bush adopts a right-of-center position, RD voting is more likely if the House Democratic candidate is closer to Bush, which means that voters seek ideological consistency rather than balance. This is consistent with arguments made by Frymer (1994) and Petrocik and Doherty (1996).

Substantively, the coefficient on the ideological variable means that the RD proportion increases by 13 percentage points when the Democrat moves one unit in the conservative direction on the $[-1,1]$ NOMINATE interval. This is not a small effect and, in standardized terms, ranks only behind ballot format and the influence of money. Furthermore, the ideological variable reduces the magnitude of the coefficient for the South variable. This suggests that RD ticket splitting is higher in the South at least partly because the Democratic candidates position themselves closer to the conservative end of the spectrum.

The most robust finding from Table 8 and the other regression analyses is that congressional campaign spending has a dramatic influence on the percentage of voters who split their ballot. As the Democratic candidate's share of spending rises, so does the proportion of Bush voters who vote for that candidate. This relationship remains the strongest force in ticket splitting, even when controlling for such related and theoretically important variables as challenger quality. In fact, the challenger quality coefficient, while having the expected negative sign, is not statistically significant. That effect is clearly captured in the spending variable, as experienced challengers are most adept at cutting into an incumbent's spending advantage (Jacobson 1997). As we elaborate below, it is not the inherent quality of candidates that matters but their ability to represent a credible alternative to the incumbent.

To illustrate the critical role of spending, Figure 1

presents a simple scatterplot showing the share of Democratic spending and the proportion of Bush splitters in contested House districts. The least-squares regression line is superimposed. The relationship is clearly linear, positive, and strong considering the crudeness of the data ($r = .91$, $p < .001$). Though money has been shown to be an important variable in congressional campaigns (Jacobson 1997), its power to induce ticket splitting has been largely unexplored (cf. Kimball 1997).

We suggest that campaign spending increases voter defection from the opposite party by drowning out the opponent's message. As the spending proportion of the Democrat nears 100%, the Republican's self-promotion is scarcely noticed by voters. Lopsided spending patterns—near both ends of Figure 1—indicate one-sided messages in a campaign. As Zaller (1992) has shown, a campaign or other media message can have a substantial effect on public opinion when countervailing messages are absent. The dominant campaign's repeated advertising raises the number of favorable "considerations" associated with that candidate in the minds of potential voters. In the voting booth, they have little incentive to vote for the unknown candidate.

This examination of the causes of split-ticket voting at the district and state level finds that most of the influences are outside the voter's control, which supports the unintentional theories of divided government. This does not mean that divided control is an accident. Voters appear to be rationally choosing the candidates who seem the most competent, defined by the cues of incumbency and campaign spending, the two largest influences on split-ticket voting. Though ideological position is a factor when congressional incumbents are on the ballot, voters do not intentionally balance a conservative presidential candidate with a liberal congressional candidate to achieve moderate policy outcomes. Our evidence indicates that split-ticket voting actually decreases as candidates move farther apart. Voters choose sincerely in presidential and congressional campaigns but must resort to the best—sometimes the only—congressional candidate when intercandidate quality differences are large.

CONCLUSION

Amid the flurry of research on divided government and split-ticket voting, this article makes two contributions. First, it uses a new ecological inference technique to produce more accurate and efficient estimates of the direction and magnitude of ticket splitting in different states and congressional districts. Previous research had to depend on aggregate data—thereby inducing the ecological inference problem—or individual-level survey data that could not be used to estimate district-level parameters. These new estimates alone are valuable, for they demonstrate considerable variation in the direction and magnitude of ticket splitting from one electoral unit to the next. Though our application was to 1988, we believe that our conclusions apply to most modern presidential elections.

The second contribution lies in explaining the newly

TABLE A-1. Ecological Inference Notation for District i

Presidential Voting Decision	House Voting Decision				Fraction of All Voters
	Democrat	Republican	Vote (Subtotal)	Abstain	
Democrat (Dukakis)	β_i^b	$1 - \beta_i^b$	λ_i^b	$1 - \lambda_i^b$	X_i
Republican (Bush)	β_i^w	$1 - \beta_i^w$	λ_i^w	$1 - \lambda_i^w$	$1 - X_i$
Fraction of voters	T_i	$1 - T_i$	V_i	$1 - V_i$	1

revealed split-ticket voting patterns. Accounting for some intentional and unintentional forces that affect voting behavior, we find that the latter exert a tremendous influence. Though voters act reasonably considering the array of candidates offered to them, they apparently do not consciously choose divided government in the face of feasible alternatives. Elite decisions, including the decision of particular candidates to run for Congress, coupled with the financial advantages that most incumbents possess drive voters toward split ballots.

APPENDIX: KING'S METHOD

King's ecological inference technique involves a combination of procedures. It begins by treating the problem as a $2 \times C$ table in which the marginals are known from aggregate data but the cells are not. Notation for the known and unknown quantities can be found in Table A-1. First, the *method of bounds* is employed to restrict estimates of β_i^w and β_i^b , the cell quantities of interest, to a narrower region than the $[0,1]$ interval (Duncan and Davis 1953). In our application, β_i^w is the proportion of Bush voters who split their tickets, and $1 - \beta_i^w$ is the proportion of Dukakis voters who split their tickets. Knowing these deterministic bounds increases the amount of information that can be used in a statistical model. King's method posits a probabilistic distribution of the quantities of interest that assumes that β_i^w and β_i^b are distributed truncated bivariate normal (TBN), conditional on X_i .

Using the TBN distributional assumption, one can create a tomography plot (β_i^w by β_i^b), in which each line represents a district. The true values of β_i^w and β_i^b must fall somewhere on the line. The normality assumption helps detect a mode on the tomography plot where most of the lines cross and improves estimates by "borrowing strength" from other districts. Intuitively, the most likely values for β_i^w and β_i^b are nearest the mode, which is the peak of the three-dimensional normal bell shape.

After adding a couple of modest assumptions, five intermediate parameters that define the TBN distribution are estimated via a maximum likelihood function (i.e., two means, two standard deviations, and a correlation that make up the vector ψ). The parameters are then transformed and rescaled. Values of these parameters are drawn from the posterior distributions using importance sampling. The means of the distributions of β_i^w and β_i^b are used as point estimates, and standard errors (and confidence intervals) are based upon the variation in the simulated values. This is a real benefit, as earlier methods suffered from an inability to report accurate levels of uncertainty associated with point estimates (King, Keohane, and Verba 1994). This is the intuition; see section III of King (1997) for a complete description of the method.

Information Effects in Collective Preferences

SCOTT L. ALTHAUS *University of Illinois at Urbana-Champaign*

Contrary to much of the literature on collective opinion, I find that the low levels and uneven social distribution of political knowledge in the mass public often cause opinion surveys to misrepresent the mix of voices in a society. To assess the bias introduced by information effects, I compare "fully informed" collective preferences simulated from actual survey data to collective preferences revealed in the original data. Analysis of policy questions from the 1988 and 1992 American National Election Studies shows that group differences in knowledge, along with the public's modest average level of political knowledge, can cause significant distortions in measures of collective opinion. The mass public may appear more progressive on some issues and more conservative on others than would be the case if all citizens were equally well informed. To the extent that opinion polls influence democratic politics, this suggests that information effects can impair the responsiveness of governments to their citizens.

A number of path-breaking studies in recent years have suggested that the mass public's inattention to politics may have less bearing on the quality of its collective opinions than previously thought (e.g., Converse 1990; Page and Shapiro 1992; Popkin 1991; Sniderman, Brody, and Tetlock 1991; Wittman 1995). These studies emphasize that while most individuals tend to be ill informed about the political world, the availability of heuristic shortcuts and the filtering process of statistical aggregation may help compensate for this lack of knowledge in measures of collective opinion, such as election results or opinion surveys. If this line of thinking is correct, then we can conclude with Page and Shapiro (1992, 385) that opinion surveys provide a "good deal of coherent guidance about policy." If the mass public is unable to compensate effectively for its lack of political knowledge, then the use of surveys and other measures of collective opinion as inputs to the political process may be rightly questioned.

In this article I extend recent work by Delli Carpini and Keeter (1996) and Bartels (1996) on the measurement of information effects in collective preferences. Contrary to much of the literature on collective opinion, this study finds that the low levels and uneven social distribution of political knowledge in the mass public often cause opinion surveys to misrepresent the mix of voices in a society. Correcting for information asymmetries reveals that many collective policy preferences would look quite different if all citizens were equally well informed about politics.

Because knowledgeable respondents are better able to form opinions consistent with their political predis-

positions (Bennett 1995; Converse 1964; Delli Carpini and Keeter 1996; Lockerbie 1991; Stimson 1975; Zaller 1992), and because they tend to give opinions more frequently than other people (Althaus 1996a; Delli Carpini and Keeter 1996, 230–1; Krosnick and Milburn 1990), the demographic characteristics of well-informed people—who tend to be more affluent, older, white, and male compared to the ill informed—can cause collective preferences to reflect disproportionately the opinions of some groups more than others. These two dynamics can create information effects in measures of public opinion. By *information effect*, I mean a bias in the shape of collective opinion caused by the low levels and uneven social distribution of political knowledge in a population. While others have examined the individual-level effects of political knowledge on response stability (e.g., Delli Carpini and Keeter 1996, 231–4; Feldman 1989, following Converse 1964) and the role of political knowledge as a link between political predispositions and policy or voting preferences (e.g., Bennett 1995; Delli Carpini and Keeter 1996, chapter 6; Zaller 1992), the focus here is more narrowly on the macrolevel impact of these effects on measures of collective opinion.

Building on the simulation approach developed independently by Delli Carpini and Keeter (1996) and Bartels (1996), this article examines the substantive impact of information effects in policy preference data from the American National Election Studies (NES). Simulating "fully informed" collective preferences from actual survey data shows that group differences in knowledge, along with the public's rather modest average level of political information, can cause significant distortions in measures of collective opinion. More important, the direction and magnitude of these distortions fall into predictable patterns. The uneven social distribution of political knowledge causes the mass public consistently to appear more progressive on some issues and more conservative on others than might be the case if all citizens were equally well informed about politics. To the extent that opinion polls influence democratic politics, this finding suggests that information effects may impair the responsiveness of governments to their citizens.

Scott L. Althaus is Assistant Professor of Speech Communication and Assistant Professor of Political Science, University of Illinois at Urbana-Champaign, Urbana, IL 61801-3694 (salthaus@uiuc.edu).

Earlier versions of this article were presented at the 1996 annual meeting of the American Political Science Association and the 1997 annual meeting of the International Communication Association. I am grateful to the ICPSR and the University of Michigan Center for Political Studies for making available the NES data. I am indebted to Ben Page, Susan Herbst, Jane Mansbridge, Patricia Conley, Scott Keeter, Michael Delli Carpini, Dennis Chong, Paul Gronke, and Steven Klepper for their helpful comments and suggestions over the course of this project. All analyses were conducted using SPSS for Windows 7.0.

HOW POLITICAL KNOWLEDGE AFFECTS COLLECTIVE OPINION

Survey after survey has shown that citizens are often at a loss to relate basic facts about the players, issues, and rules of the game that structure American political life (Delli Carpini and Keeter 1996). The extent of this ignorance led several early and influential studies to suggest that the public's political opinions are often fickle and not to be trusted (Almond 1950; Berelson, Lazarsfeld, and McPhee 1954; Converse 1964; 1970). Yet, in recent years this pessimistic view of public opinion has been challenged on several fronts. The first challenge stems from work in cognitive psychology showing that people who are ill informed about public affairs can nonetheless form opinions consistent with their political predispositions. They can do this by taking cues from trusted political elites about which policies they should prefer and by harnessing a variety of heuristic strategies to deduce their political preferences, thus avoiding the need to infer preferences from factual bits of knowledge stored in long-term memory (e.g., Ferejohn and Kuklinski 1990; Lupia 1994; Mondak 1994; Popkin 1991; Smith and Squire 1990; Sniderman, Brody, and Tetlock 1991; Zaller 1992). From this perspective, the public's low levels of information may not be a significant problem because many people apparently can compensate for their lack of knowledge with information shortcuts.

The second challenge comes from a line of work suggesting that aggregate opinion may be able to reflect the public's interests even when the opinions of most individuals are ill informed, ambivalent, indifferent, or inconsistent (e.g., Converse 1990; Ferejohn and Kuklinski 1990; Page and Shapiro 1992). This view suggests that the process of aggregating opinions should tend to cancel out the more or less random opinions given by ill-informed respondents. To the extent that this occurs, measures of collective opinion should reflect the nonrandom opinions of knowledgeable respondents. A related argument stemming from Condorcet's jury theorem suggests a similar conclusion. Based entirely on statistical probabilities, the theorem shows that, under certain conditions, groups tend to provide more informed decisions than individuals (Condorcet [1785] 1972; Grofman and Owen 1986; Ladha 1992; Miller 1986; but see Austen-Smith and Banks 1996). From this perspective, it is the aggregation process itself which generates meaningful collective opinions.

Further support for "revisionist" challenges comes from experimental studies suggesting that the common methods used to measure information about politics may actually test recall ability rather than knowledge-in-use. Known as the "on-line" or "impression-driven" model of information processing (Lodge, McGraw, and Stroh 1989; Lodge, Steenbergen, and Brau 1995), this view suggests that many people process information at the time they are exposed to it, update their opinion accordingly, and then quickly forget the information itself while retaining the updated summary judgment. Thus, people may express informed preferences even

though they may be unable to recall the factual information used to shape those preferences. From this perspective, the public's apparently low levels of political knowledge may be a red herring. Its judgments may be more informed than they seem in light of the apparently poor performance of those citizens on knowledge tests.

Despite the note of optimism sounded by these revisionist arguments, empirical evidence in support of their claims is quite modest. A number of studies have detailed how people *can* use on-line processing and various information shortcuts to make up for a lack of factual knowledge, but there is surprisingly little evidence that large numbers of people *do* use these strategies effectively, regularly, and across a wide range of situations and issues. More glaring still is the lack of support for the collective rationality hypothesis. I am aware of only two attempts to test this idea empirically. One study (Bartels 1996) found that aggregation helped voters act as if they were somewhat better informed than they actually were, but not as if they were fully informed. The other (Althaus 1995) found that statistical aggregation had quite limited information-pooling qualities.

Revisionist perspectives also tend to overlook an important fact: Low information levels are only half the problem. Just as important is the observation that some kinds of people tend to be better informed than others. Knowledge of politics is concentrated among those who are politically and socially advantaged. College graduates and relatively affluent people tend to be consistently well informed, while high school dropouts and relatively poor people tend to be consistently ill informed (Delli Carpini and Keeter 1996; Neuman 1986; Sigelman and Yanarella 1986). Political knowledge also is distributed unevenly among groups with distinctive and potentially competing political interests. For instance, whites tend to be more informed than blacks, men more than women, and older people more than younger people (Bennett 1988; Delli Carpini and Keeter 1996; Neuman 1986; Sigelman and Yanarella 1986).

There are two ways that information asymmetries among groups can undermine representation in opinion surveys. The first is by affecting the demographic correspondence between a survey sample and the group of people who give substantive responses. Those who are poorly informed about politics tend to give "don't know" and "no opinion" responses at much higher rates than more knowledgeable people (Althaus 1996a; Delli Carpini and Keeter 1996, 230-1; Krosnick and Milburn 1990). This tendency leaves the group of opinion givers disproportionately well educated, affluent, male, white, and middle aged relative to the population they are supposed to represent (Althaus 1996b). Because these voices tend to be overrepresented in the ranks of opinion givers, the particular needs, wants, and values expressed by some groups may come to be represented disproportionately in collective preferences.

The second way that information asymmetries affect representation is by influencing the quality of opinions

that respondents provide. Our ability to form preferences consistent with our political predispositions is often mediated by the quality and quantity of political information we can bring to bear on an issue. The importance of knowledge to the formation of policy preferences comes from the way that values are connected to attitudes through beliefs: beliefs about the state of the world, cause-and-effect processes, what government is currently doing, and the likely outcomes of government actions (Delli Carpini and Keeter 1996, chapter 6; Downs 1957, 79–80). Some ill-informed people may believe a policy is the “correct” solution without knowing whether it is consistent with their predispositions or whether it is the best way to achieve a given end. Others may believe a policy serves their interests, while someone with more perfect or complete information can see that the policy is diametrically opposed to them. Because the well informed are likely to have more accurate beliefs than the ill informed, they are more likely to express policy preferences consistent with their political predispositions (Converse 1964; Lockerbie 1991; Stimson 1975; Zaller 1992). As a result, the interests of respondents who are relatively well informed may come to be more accurately reflected in measures of collective opinion. In other words, such measures may reflect the needs, wants, and values of whites better than those of blacks, men better than women, and the rich better than the poor.

It would seem that the low levels and uneven social distribution of political knowledge may indeed have an important bearing on the quality of surveyed public opinion. The problem is how best to measure any potential distortion in collective preferences brought about by information asymmetries. One must find a way to estimate how the opinions people express in surveys might change if respondents were more completely informed about the issues.

MEASURING INFORMATION EFFECTS IN COLLECTIVE PREFERENCES

Ever since Marx suggested that “false consciousness” distracts workers from their material interests, students of politics have grappled unsuccessfully with how to determine whether people’s interests are at odds with their opinions. Some, like Marx and Edmund Burke before him, argue that political interests are objective and can be identified for any group of people without regard to their stated preferences. Some, like Jeremy Bentham and John Stuart Mill, claim that interests are subjective and thus inseparable from the expressed wishes of individuals speaking for themselves. But in light of inherent problems with each of these definitions, more recent work has focused instead on interests as “fully informed” or “enlightened” preferences (Bartels 1990; Connolly 1972; Dahl 1989, 180–1; Delli Carpini and Keeter 1996; Lippmann 1955, 42; Mansbridge 1983, 24–6). In this perspective, as Jane Mansbridge (1983, 25) puts it, interests are revealed in “the preferences that people would have if their information were perfect, including the knowledge they would have

in retrospect if they had a chance to live out the consequences of each choice before actually making a decision.” By equating interests with hypothetical fully informed preferences, this perspective provides a useful approach for determining when the preferences expressed by individuals may be at odds with their “fully informed” needs, wants, and values.

The difficulty lies in sorting out the best among several possible ways of operationalizing this definition of interests. Two traditional approaches have been used to explore what collective opinion might look like if opinion givers were relatively better informed than the general public. The first is to purge ill-informed respondents from among the ranks of opinion givers through the use of filtering questions. While this is a particularly blunt method—it ignores completely how individual opinions might change with more political knowledge—it is nevertheless widely used by survey organizations to isolate “informed” public opinion.

The second approach manipulates the amount and quality of information available to people who express preferences of various kinds. Experimental methods for assessing the role of information in preference formation have been used extensively in social and cognitive psychology. These methods have also been used to explore what fully informed collective policy preferences might look like. To date, the most ambitious use of such methods has been by James Fishkin (1991, 1995) in experiments with deliberative opinion polls, which bring a random sample of ordinary citizens to a central location where they are provided with detailed policy information and an environment in which to discuss issues. In this way, argues Fishkin (1995, 171), “the deliberative poll can be thought of as an actual sample from a hypothetical society—the deliberative and engaged society we do not have.”

Yet, even experimentation provides an unsatisfactory measure of fully informed collective preferences. It is possible in an experimental setting to provide people who are normally oblivious of the political world with information that they can use to formulate preferences, but ill-informed subjects cannot be equipped with other important traits normally associated with being well informed: the cognitive styles and information processing strategies characteristic of politically knowledgeable people (Fiske, Lau, and Smith 1990; Krosnick and Milburn 1990; McGraw and Pinney 1990; Sniderman, Brody, and Tetlock 1991), the knowledge stored in long-term memory that affects how new information is perceived and used to update attitudes (Delli Carpini and Keeter 1996; Krosnick and Milburn 1990; Zaller 1992), and the confidence, developed through experience, that one is able to understand complicated political issues and events (Krosnick and Milburn 1990). Moreover, typical experimental settings also fail to duplicate the social contexts in which political information is acquired and used to form preferences (Huckfeldt and Sprague 1995). It would seem that while experimental methods are especially useful in differentiating informed from ignorant people, they are less suited to predicting the sorts of policies a fully informed public might prefer.

Where filter questions and experimental methods fall short, a third way of simulating fully informed preferences offers promise. Independently pioneered in work by Delli Carpini and Keeter (1996, chapter 6) and Bartels (1996), this approach uses multivariate regression to simulate how individual opinions might change if opinion givers were better informed about politics. Unlike filter questions and experimental methods, this approach is explicitly premised on the concept of "enlightened preferences" and on the social construction of political interests. Estimates of fully informed opinions are generated by assigning the preferences of the most highly informed members of a given demographic group to all members of that group, simultaneously taking into account the influence of a wide range of demographic variables. For instance, if policy preferences of well-informed respondents from union families differ from those of ill-informed respondents from union families, then this approach assigns the mix of fully informed preferences to all respondents from union families. But instead of considering only the bivariate relationship between union membership and policy preferences, this method looks at union respondents who are women, from a certain income level, who live in eastern states, are married, own homes, of a certain age, and so on. If the most informed people sharing all these characteristics have different preferences from the least informed people, then their mix of fully informed preferences is assigned to everyone who shares their demographic characteristics.

The present study extends this basic approach in several ways. First, I use logistic regression to avoid the restrictive assumption that political information must have a linear relationship with preferences.¹ Second, I estimate fully informed preferences for people who give "don't know" and "no opinion" responses in the actual data, following the assumption that as information levels rise, the proportion of people who give opinions or turn out to vote should also rise. Third, while Bartels examined vote choices in presidential elections and Delli Carpini and Keeter analyzed five scales representing different policy domains, I conduct simulations on individual policy questions representing a broad range of political issues. Although the individual questions analyzed here may be less reliable measures of attitudes than scales composed of multiple questions, analyzing the marginals of specific questions has two distinct advantages. It can reveal the influence of question wording on information effects and, since marginal percentages seem to be the lingua franca of opinion surveys in the political sphere, how the surveyed opinion that "counts" politically may be skewed by the social distribution of political knowledge.

The logit model I use for simulating fully informed opinions is structured as follows:

$$\text{prob}(Y_i = 1)$$

$$= \alpha + \beta_1 I_i + \sum \beta_k D_{ik} + \sum \delta_k (I_i * D_{ik}) + e_i,$$

where Y_i is respondent i 's dichotomous policy preference (e.g., 1 = "favor," 0 = "oppose"); I_i is respondent i 's score on a scale of political information; D_{ik} is respondent i 's score on the k th demographic characteristic; $I_i * D_{ik}$ is the product of respondent i 's information score multiplied by respondent i 's score on the k th demographic characteristic; and e_i is the error term for the i th observation. In this equation, β_1 is the coefficient for the information variable, β_k is the coefficient for the k th demographic characteristic, and δ_k is the coefficient for the k th interaction term.

The measures of political information are scales developed for NES data by Delli Carpini and Keeter (1993, 1996). These scales, which are detailed in Appendix A, are built primarily from direct measures of factual knowledge, in contrast to the exclusive reliance by Bartels on subjective ratings of interviewers.² The political information scale for the 1992 NES has a maximum value of 23, with a mean of 12.7 and standard deviation of 5.8; the scale for the 1988 NES has a maximum value of 20, mean of 10.3, and standard deviation of 5.0. These scales have respective alpha reliabilities of .893 and .876.

The D_{ik} terms account for the effects of *Education, Income, Age, Partisanship, Race, Gender, Marital Status, Occupation, Religious Affiliation, Union Membership, Homeowner Status, Parental Status, Financial Status, Region, and Type of Community* (see Appendix A for coding details). For the 1992 data I also included *Receiving Welfare Benefits* and *Receiving Other Benefits*.³ These characteristics represent all the available demographic variables that tend to be relatively stable features of a respondent's makeup and that may be expected to have some bearing on policy preferences. Excluded from the analysis were attitudinal variables that may be determined by or confounded with levels of political information. The resulting mix of demographic variables is quite similar to that used by Bartels (1996) and by Delli Carpini and Keeter (1996), with one significant exception. I include party identification because it is a relatively stable trait, which puts it on par with the other demographic variables; more important, partisanship is a widely used cueing mechanism

² Interviewer ratings of respondent knowledge levels discriminate well relative to factual knowledge scales (Zaller 1985), but correlations between these measures run between .57 and .68, which demonstrates that the two are not synonymous (Delli Carpini and Keeter 1992, 1993; see also Luskin 1987). While interviewer ratings are frequently used as components of political knowledge scales (Delli Carpini and Keeter 1996; Zaller 1985), these findings suggest that they may be poor stand-alone substitutes for direct measures of political knowledge.

³ These two variables were not available in the 1988 data. Including the constants and interaction terms, there were 52 parameters estimated in the 1988 data and 56 parameters in the 1992 data. While the number of parameters is substantial, the large sample size of the NES studies (1,775 completed interviews in 1988; 2,255 in 1992) should ensure the asymptotic properties of efficiency, lack of bias, and normality (Aldrich and Nelson 1984, 53; also see King 1989, 74-80).

¹ Delli Carpini and Keeter (1996) use ordinary least squares to estimate parameters in their simulation; Bartels (1996) uses a probit model to estimate parameters, which are then transformed in a way that assumes linearity of information effects.

and information shortcut for issue positions (Campbell et al. 1960; Page 1978; Rahn 1993; Rahn and Cramer 1996). To the extent that party identification serves as a heuristic shortcut, excluding it from analysis could exaggerate the apparent importance of factual information to policy preferences (cf. Dimock and Popkin 1995).

This model was applied to a set of policy questions asked in the 1988 and 1992 NES (Miller et al. 1991, 1993). Since a logistic regression (logit) model was used to estimate coefficients, the data set consists of all policy questions from these studies with binary response options and any other policy questions that can be collapsed straightforwardly into dichotomous distributions. This made for a total of 45 usable questions out of the approximately 100 available.

The simulation proceeds in four steps. First, policy preferences are regressed on the full set of information, demographic, and interaction variables. This step estimates the relationships among these variables and provides a set of coefficients for simulating fully informed opinions. Second, each respondent's score on the political information scale is changed to the highest possible value. In the 1992 NES, for instance, that value was 23 points, so all respondents in the 1992 study were assigned a score of 23. Third, each respondent's fully informed opinion is calculated by plugging the coefficient values obtained from step one into each respondent's actual demographic characteristics, substituting only the new values of the altered information variable and interaction terms. Fully informed opinions are also estimated in this step for respondents who gave "don't know" or "no opinion" responses in the actual survey. Thus, respondents counted as "missing" in the actual data were assigned the same mix of fully informed preferences as the people who share their demographic characteristics and who actually gave opinions. In essence, this is a sophisticated way of weighting the preferences of opinion givers who have a certain combination of demographic characteristics by the number of respondents who share those characteristics. Fourth, all the individual fully informed opinions, including those of people who originally responded "don't know" and "no opinion," are aggregated into a fully informed collective preference. I use the mean of the Y_i probabilities to construct fully informed marginal percentages that can be compared directly to actual marginal percentages. Using marginals to gauge the substantive influence of information effects provides what is probably the most easily interpretable test statistic that can be generated with logistic regression methods.

It is important to note that the marginals resulting from this simulation process can be compared directly to the actual marginals only because they are operationalized as the mean of the individual probabilities that $Y_i = 1$ instead of the sum of the predicted values of Y_i . For instance, if 60% of all respondents sharing a certain demographic profile favor a certain policy, each respondent has a probability of .6 for favoring the policy. The mean of these probabilities recovers the actual percentage in favor (.6 = 60%), but since the

predicted value of Y_i for each respondent is 1 (because .6 > .5), estimates from predicted values would mistakenly show a group that is 100% in favor of the policy. The upshot is that most ordinary least squares applications (including the simulation method used in Delli Carpini and Keeter 1996) are less suited for estimating information effects than maximum likelihood applications because they introduce large amounts of error into such estimates.

The end results of this four-step transformation are uniformly high information levels across demographic groups and substantive opinions for all respondents. Using only the observed differences between well- and ill-informed respondents, this method imputes to all respondents the information processing strategies and cognitive styles employed by well-informed people. It also allows political information to interact with demographic characteristics in ways that may move preferences in one direction for some groups and in the opposite direction for other groups. This flexibility allows the model to reflect accurately the social diversity of needs, wants, and values. Of course, increasing levels of information may lead instead to greater consensus of opinion across groups, and the simulation method leaves that possibility open as well. Most important, this method is not predisposed to finding any information effects at all: If well- and ill-informed respondents give essentially the same mix of preferences, then the shape of the resulting fully informed preference should be about the same as the actual one (Bartels 1996, 208–9).

INFORMATION EFFECTS IN COLLECTIVE PREFERENCES

The appropriate test for the significance of information effects in the model used here is the likelihood ratio test (Bartels 1996, 209).⁴ This test was found to be significant at the $p < .01$ level in 84.4% of the 45 questions and at the $p < .05$ level in 88.9%. In other words, the unrestricted model, which takes information effects into account, tends to provide a substantially better fit to the data than does the restricted model, which assumes no information effects. Information effects in policy questions appear to be the norm rather than the exception.

⁴ Similar to the F -test used to compare improvement of fit in OLS equations, the likelihood ratio test compares the log likelihoods of an unrestricted logit model, which includes all the variables, and a restricted logit model, which lacks the information and interaction terms, to determine the significance of the differences between them. For example, the $-2 \log$ likelihood of the unrestricted equation in Table 1 is 2063.7, while that of the restricted equation without interaction terms (not shown) is 2159.0. The result is a χ^2 value of 95.3, with $m = 28$ degrees of freedom, where m is equal to the number of parameters in the restricted model. This value is significant at the $p < .00001$ level, so the null hypothesis of no information effects can be safely rejected.

TABLE 1. Logit Coefficients for Opposition to Spousal Notification Laws (1 = Oppose)

Independent Variables	Main Effects	Interaction Effects (× Information)
Information (1–23)	-.027 (.089)	
Education (years)	-.043 (.072)	.013** (.005)
Income (percentile)	.011 (.008)	-.000 (.001)
Age (years)	.009 (.014)	-.001 (.001)
Republican	.568 (.443)	-.075* (.033)
Democrat	-.149 (.408)	.015 (.031)
Black	.663 (.447)	-.057 (.034)
Female	.062 (.358)	.053* (.024)
Married	.783* (.367)	-.072** (.026)
Union family	-.353 (.460)	.028 (.031)
Homeowner	-.948** (.358)	.048 (.025)
Parent w/child at home	.069 (.352)	-.003 (.024)
Receive welfare benefits	.045 (.472)	.020 (.034)
Receive other benefits	.397 (.428)	-.046 (.034)
Financially worse off	.178 (.321)	-.015 (.022)
Protestant	.186 (.473)	-.041 (.032)
Catholic	.188 (.518)	-.063 (.035)
Other religion	-.353 (.587)	-.006 (.040)
East	-.328 (.524)	.004 (.034)
Midwest	-.683 (.479)	.024 (.031)
South	-.645 (.456)	.030 (.030)
Urban	-.194 (.352)	.021 (.023)
Rural	-.575 (.398)	.026 (.028)
Retired	-.021 (.670)	-.018 (.047)
Homemaker	-.058 (.499)	-.004 (.038)
Executive/Professional	-.244 (.573)	.020 (.036)
Clerical	.606 (.531)	-.036 (.039)
Technical/Sales	.873 (.585)	-.050 (.039)
Constant	-1.808 (1.262)	

Note: Standard errors of parameter estimates are in parentheses. Beginning log likelihood = -1221.9; ending log likelihood = -1031.8. Beginning correct classifications = 65.4%; ending correct classifications = 73.1%. $N = 1,894$. * $p < .05$, ** $p < .01$.

Information Effects in Attitudes toward Spousal Notification Laws

Before discussing the general findings from these simulations, it will be helpful to take a close look at an example of how information asymmetries can bias collective preferences. A question from the 1992 NES asked: "Would you favor or oppose a law in your state that would require a married woman to notify her husband before she can have an abortion?" To illustrate how the fully informed collective preferences discussed later were obtained, the logit coefficients for this question are displayed in Table 1. Although this equation correctly predicts responses for nearly three-quarters of opinion givers and represents a statistically significant improvement over the restricted model,⁵ the relative paucity of significant coefficients is notable. A similar pattern was found in the Bartels simulation of information effects in vote choices: Only between 14%

and 24% of coefficients achieved conventional levels of significance (Bartels 1996, calculated from tables 1 and 4–8). The reason for this pattern appears to be a multicollinearity problem stemming from the abundance of interaction terms correlated with political information scores as well as with the demographic variables.⁶ Examining the restricted form of this equation confirms that, absent the information and interaction terms, almost half the coefficients attain conventional levels of significance (data not shown). Rerunning the regression using only the significant variable clusters identified in Table 1 produces no unexpected changes in the size or direction of coefficients. These findings suggest that the relatively large standard errors of many of the coefficients in the unrestricted equation should have little or no effect on the unbiasedness of the coefficients themselves.

A more substantial concern with the data shown in Table 1 is the potential for specification error that comes from excluding attitudinal variables. Given the need to exclude such obviously relevant measures as attitudes toward abortion and women's rights, in the analyses that follow I avoid any suggestion that the model used here can *explain* individual-level opinions. Instead, I focus on what the model is intended to capture: differences in opinion between groups as well as the relationship between information and policy preferences within groups.

Figure 1 provides a detailed comparison of the actual marginal percentages for this question and those simulated for a public with uniformly high levels of political knowledge. In the actual marginals, nearly two-thirds of respondents said they favored a spousal notification law. Yet, in contrast to this apparently strong majority opinion, the fully informed collective preference is almost evenly divided on the issue. The only difference between these two measures is that the latter controls for the uneven social distribution of political knowledge.

As a precaution, I also tested whether the presence of insignificant coefficients in Table 1 affected the simulated marginal percentages. A second measure of fully informed collective opinion was estimated using a regression containing only the significant variable clusters shown in Table 1 (information, education, partisanship, gender, marital status, and home ownership). The result of this alternative simulation was a fully

⁶ Most of this multicollinearity comes from the nature of the demographic variable clusters. For instance, in the 1992 NES, Republican partisanship is correlated with Democratic partisanship at $-.78$. Likewise, living in a suburban area is correlated at $-.57$ with living in an urban area and $-.42$ with living in a rural area. The rest is due to associations between different variables. For example, the scale of political information is correlated at $.56$ with education and $.42$ with income. Being married is correlated at $.42$ with income and $.33$ with being a homeowner. All of this is complicated by the set of interaction terms, which are linearly but imperfectly related to both the information scale and the set of demographic terms. Despite these associations, the theoretical approach to information effects adopted here dictates that all these variables be included in the logit model. The result is a large number of insignificant coefficients, but the coefficients themselves should nonetheless be valid for the purposes to which they are put.

⁵ See footnote 4.

FIGURE 1. Actual and Fully Informed Opinion on Spousal Notification Laws

informed collective preference that was 52% opposed and 48% in favor of spousal notification laws. Deviating only about three percentage points from the simulated marginals of the full equation, this result confirms the accuracy of the model shown in Table 1, despite the frequency of insignificant coefficients.⁷

Even more interesting than the substantive shift in the collective preference are the underlying dynamics of change among male and female respondents. Figure 1 shows that the direction of change from actual to simulated opinion is identical for both genders: Controlling for information asymmetries led to decreased support among both men and women for spousal notification laws. But the magnitude of this change was much smaller for men than for women. Opinion among male respondents shifted only eight percentage points, compared to twenty points among females. This smaller change among males was primarily due to a ceiling effect from their higher average information scores and to the weaker relationship for males between political information levels and opposition to notification laws (data not shown).

After assigning all respondents equally high information levels, the group preference of fully informed men (i.e., support for notification laws) remained unchanged from that of actual opinion. Thus, the fifteen-point swing in collective opinion came mostly from

changes in the opinions of female respondents. As shown in Figure 1, group opinion among women shifted twenty percentage points in a pro-choice direction once information levels were raised and standardized. This resulted in an almost perfect reversal of majority opinion among female respondents: Whereas 61% of women said they favored a spousal notification law in the actual data, 59% said they opposed it in the simulated data.

These findings suggest that the information imbalances between men and women suppress the magnitude of pro-choice opinion revealed in opinion surveys. The fully informed majority preference of women on the issue of spousal notification laws is diametrically opposed to that of men, while their actual majority preference is the same as that of men.

General Patterns of Information Effects in Collective Preferences

With this insight into the effects of information disparities on collective preferences, we now turn to the general findings from the simulation data. Table 2 displays these overall results for each of four issue categories and for all questions together (Appendix B contains results for individual questions). Foreign policy covers the use of military force abroad, economic sanctions, arms agreements, and whether the United States should become more involved in solving problems around the world. The fiscal category addresses levels of government spending and taxation. Operative issues deal with the size and scope of the federal government, the election of legislators, and government regulation of the economy. Social policy covers such topics as abortion, gay rights, the death penalty, and affirmative action.

The first column shows the mean percentage point change between actual and fully informed opinion for all questions in each category. A score of five, for example, indicates a five-point shift in the marginals of one of the response options, as when collective opinion changes from 50% to 55% in favor. Table 2 shows that the average difference between actual and fully informed opinion was about seven percentage points. Questions dealing with fiscal issues had the largest average point change, while social policy questions had the smallest average difference between actual and simulated opinion measures.

These averages give a somewhat misleading picture, however, as the distribution of point differences is skewed toward the low end of the scale. Twenty of the 45 questions (44%) had a difference of between zero and five points, 13 (29%) differed between six and ten points, nine questions (20%) had differences of between eleven and fifteen points, and three (7%) differed by more than fifteen points. In the more than half of observations in which nontrivial changes were observed—that is, changes on a magnitude greater than five percentage points—the differences between actual and fully informed opinion averaged 10.8 points. When collective opinion changed by more than a few points, it tended to shift quite dramatically.

⁷ In this particular case, a shift on the magnitude of three points nevertheless signals a reversal in the collective preference simulated for a fully informed public. Although a shift of this magnitude does not count as a change in preference ordering for this study (it would still be counted as a tie: see footnote 9 below), it demonstrates the importance of examining the size of point changes in conjunction with any changes in preference ordering.

TABLE 2. Differences between Actual and Fully Informed Collective Preferences

Category	Average Point Change	N with Different Preference Order	Fully Informed Opinion Relative to Actual Opinion
Foreign policy issues (N = 8)	6.13 (3.80)	1 of 8	More dovish and interventionist
Fiscal issues (N = 6)	11.61 (7.28)	3 of 6	More willing to pay for more services and deficit reduction, less willing to maintain high defense spending
Operative issues (N = 8)	9.22 (6.41)	2 of 8	More opposed to government control of economy, more in favor of free market approaches
Social policy issues (N = 23)	5.49 (4.16)	3 of 23	More progressive in general, but slightly less progressive on some racial issues
All issues	7.08 (5.35)	9 of 45	

Source: Pooled data from 1988 and 1992 NES.

Note: Standard deviations are in parentheses.

Earlier it was suggested that the point differences between actual and simulated opinion might be exaggerated if party identification variables were omitted from the simulation equations. This expectation turned out to be incorrect. Rerunning the simulations without party identification variables (data not shown) produced estimates of information effects that were essentially identical to the simulation results reported here.⁸

While Table 2 shows that correcting for information asymmetries can lead to substantial shifts in collective opinion, changes of equal size may not be equally meaningful. A change from 80% to 90% in favor of a policy is in some ways less important than a change from 45% to 55% support; the former merely reinforces the majority opinion, while the latter indicates a substantive shift in majority opinion. The relative importance of the differences between actual and fully informed opinion can thus be clarified by noting when they cause collective policy preferences to change.

The middle column of Table 2 shows the number of questions in each category for which the preference order of fully informed opinion differed from that of actual opinion. Three possible collective preferences were considered: a majority in favor, a majority opposed, or a tie between options.⁹ Any case in which the collective preference in actual opinion differed from that in the simulated marginals was coded as a change in preference order.

The frequency with which preference shifts occurred is a significant finding. After controlling for information effects, collective preferences changed in fully

one-fifth of policy questions. Change was most frequent in the fiscal category and least frequent in the area of foreign policy, although the small number of questions makes it difficult to draw any firm conclusions about differences between issue categories. The important point is that controlling for the effects of information on individual responses often results in new collective preferences. This contrasts somewhat with the findings of Bartels (1996), who studied information effects in presidential election outcomes. Although Bartels found information effects in vote choices that are comparable to the patterns examined here, in every election he studied, correcting the popular vote totals for the presence of information effects would have resulted in the same outcome as was historically the case.¹⁰ In contrast, the collective ordering of policy preferences seems to be much more sensitive than aggregate vote choices to information effects.

My interpretation of what fully informed opinion looks like relative to actual opinion is given in the third column of Table 2. Fully informed opinion on foreign policy issues is relatively more dovish and interventionist than actual opinion. For example, while 29% of respondents in 1988 agreed that the United States should stay out of problems in other parts of the world, the level of agreement dropped to just 18% of fully informed responses. An example of dovishness in fully informed foreign policy preferences comes from another question from the 1988 NES: "Do you favor or oppose using American military forces in the Middle East to protect oil shipments?" While 64% of actual responses favored military deployment, support dropped to 58% of fully informed responses.

⁸ Of the simulations controlling for party identification, 57.8% ($n = 26$) produced smaller estimates of information effects than the simulations that omitted party identification variables, hardly an improvement over chance. Moreover, the mean difference between simulations that omitted party identification and the measures of fully informed opinion listed in Appendix B was only two-thirds of a percentage point. Contrary to expectations, controlling for party identification seems to have little influence on the size or direction of information effects in these data.

⁹ A tie was defined as any marginals falling within plus or minus 3 percentage points of the 50% mark. These boundaries approximate the 95% confidence interval for point estimates from these data. It follows that a majority is defined as at least 53.5% of responses.

¹⁰ Calculated from Table 2 of Bartels 1996 and popular vote totals from the *Statistical Abstract of the United States*. Correcting actual popular vote totals with the estimated aggregate deviations from fully informed voting reported in Table 2 of Bartels 1996 has the following results: Nixon wins by 59.0% instead of 60.7% in 1972, Carter by 51.5% instead of 50.1% in 1976, Reagan by 56.3% instead of 50.7% in 1980 and by 53.9% instead of 58.8% in 1984, Bush by 56.4% instead of 53.4% in 1988, and Clinton by 45.2% instead of 43.0% in 1992.

Simulated opinion on fiscal issues is more favorable toward paying for deficit reduction and for a larger number of governmental services than is actual opinion. The proportion of respondents willing to pay higher taxes in order to reduce the deficit rose from 31% in the actual data to an impressive 53% in the simulated data. And while 35% of actual respondents agreed that "the government ought to cut taxes even if it means putting off some important things that need to be done," agreement dropped to 22% when controlling for information effects. Likewise, only 30% of actual respondents in the 1992 NES said that they would be willing "to pay more in taxes so that the government could spend more on the services you favor," but support rose to 47% among fully informed respondents. There were only two exceptions to the tendency for fully informed opinion to favor increased federal spending. While 68% of actual respondents felt that the United States should maintain high levels of defense spending, support dropped to 64% for fully informed respondents, and in terms of satisfaction with current levels of Social Security, 40% of actual respondents said benefits were about right or too high, compared to 48% of fully informed respondents.

With regard to operative issues, fully informed opinion is relatively more opposed than actual opinion to the idea of "big government." While 63% of actual opinion givers in 1988 agreed that "the government is getting too powerful," the level of agreement rose to 71% among fully informed respondents. Likewise, in 1992, 65% of actual respondents felt "there are more things that government should be doing," compared to only 50% of fully informed respondents. In simulated opinion, this option tied with "the less government the better."

In the area of social policy, fully informed opinion is more progressive than actual opinion on most issues. Simulated opinion is consistently more pro-choice than actual opinion (39% versus 25% opposed to parental notification laws) and more supportive of gay rights (40% versus 28% favored allowing gay couples to adopt children). A similar direction of change was observed for most social policy issues, the one exception being specific programs aimed at giving preferential treatment to African Americans. On matters such as affirmative action and school integration, fully informed opinion tends to be slightly less supportive than actual opinion. At the same time, simulated opinion is slightly more progressive than actual opinion on the general need for government to guarantee equal opportunity and fair treatment to blacks (see Appendix B).

The general pattern emerging from the simulations is for fully informed opinion to be more dovish and interventionist on foreign policy, more progressive on social and fiscal issues, and more conservative on operative issues. It is interesting that the same general trends were found when the simulations were reestimated using years of education in place of the factual knowledge scales and using only statistically significant variable clusters (data not shown). Furthermore, these general patterns of differences between actual and fully

informed opinion are consistent with results from other simulation methods (Althaus 1996a; Delli Carpini and Keeter 1996; chapter 6), with the broad patterns of opinion change among participants in the National Issues Convention held in January 1996 (Public Broadcasting Corporation 1996), and with the results of question filter experiments (Bishop, Oldendick, and Tuchfarber 1983). They are also consistent with previous studies comparing differences between well- and ill-informed survey respondents on a variety of policy issues (e.g., Althaus 1996a; Dimock and Popkin 1995; Key 1961, 331–41; Neuman 1986, chapter 3; Popkin and Dimock 1995).

CONCLUSION

Correcting for the low levels and uneven social distribution of political knowledge can change our understanding of collective preferences in significant ways. This study found that the effects of information asymmetries on collective opinion are both larger and more common than suggested by previous work. Controlling for information effects produces an average change of seven percentage points in question marginals and reveals that one in five policy questions might have a different collective preference if everyone were equally well informed about politics.

Obviously, these findings only suggest what collective opinion might look like in a hypothetical world of politically attentive citizens. While it is tempting to suppose that simulations of fully informed opinion somehow reflect the underlying political interests of the mass public, I draw no such conclusion from these data. The key contribution of this study lies not with speculating about the public's true interests but with demonstrating that survey results sometimes look the way they do because so many people are ill-informed about politics and because certain people tend to be better informed than others.

Interpreting the findings presented here in light of the existing literature on public opinion is a surprisingly difficult task, for the results of this study seem to both challenge and support the idea that the mass public's command of political knowledge is related to the quality of its collective preferences. On the one hand, the results can be seen as validating the hypothesis that on-line processing, heuristic shortcuts, and statistical aggregation help the mass public compensate for its lack of political knowledge. After all, the optimist might say, nearly half the question marginals shifted less than six points after correcting for information effects, and the ordering of collective preferences remained unchanged for eight in ten questions. On the other hand, the findings can be seen as challenging the view that heuristics, on-line processing, and statistical aggregation help an ill-informed public express policy preferences similar to those it might give if it were more knowledgeable about politics. After all, the pessimist might say, more than half the question marginals shifted at least five percentage points, and one-quarter shifted more than ten points after correcting for information effects. Moreover, the pessimist might add, the

ordering of collective preferences changed for one out of five questions when information effects were controlled.

Choosing between these competing interpretations requires a standard for determining when information effects are a problem. Earlier I made use of three such standards for evaluating individual questions: when likelihood ratio tests for the presence of information effects attain statistical significance, when differences between actual and fully informed collective opinions exceed five percentage points (which corresponds roughly to exceeding the 95% confidence interval for point estimates made from 1988 and 1992 NES data), and when correcting for information effects results in different preference orderings for collective opinions. Yet, such standards are of little help when moving beyond individual questions to evaluate more general patterns in groups of questions. Here the issues of interest are how often preference orderings must change for information effects to be called frequent, and how sizable mean point changes must be for information effects to be called large. As the answers to these questions vary with the vantage point and expectations of the individual observer, I submit my own assessment of the relative importance of information effects, recognizing that it is one among several valid interpretations of these results.

Given the frequency of shifts in collective preferences and the sizable point changes that occurred with some regularity when controlling for information asymmetries, I am inclined to see these results as challenging more than supporting the revisionist arguments that collective preferences are "rational" and reliable guides for public policy. Yet, the familiar warnings about the public's civic incompetence that have been made since the early 1950s are similarly challenged by this analysis. It would seem that a middle position fits best with the results presented here: Sometimes collective policy preferences are significantly influenced by the public's modest level of knowledge about politics, and sometimes they are not. Most of the time, at least in NES data, the aggregate effect of information asymmetries seems likely to be palpable but not decisive.

APPENDIX A: VARIABLES AND CODING

Demographics

Income is measured as income percentiles, *Education* is measured as years of formal schooling, and *Age* is measured in years. *Republican* and *Democrat* are coded 1 for the appropriate partisan identification (including independent "leaners") and 0 for all others. *Black* is coded 1 for African Americans and 0 for all others, *Female* is coded 1 for women and 0 for men, *Union Family* is coded 1 if any member of the respondent's household belongs to a union. *Homeowner* is coded 1 for people who own their own home and 0 for all others, and *Parent with a Child at Home* is coded 1 for respondents whose minor children reside with them and 0 for all others. *Receiving Welfare Benefits* is coded 1 for people living in a household where they or family members receive food stamps, Medicaid, unemployment, and/or AFDC and is

coded 0 for all others. *Receiving Other Benefits* is coded 1 for people living in a household where they or family members receive payments from Medicare and/or Social Security. *Financially Worse Off* is coded 1 for respondents who reported being worse off financially compared to one year before and 0 for all others. *Protestant*, *Catholic*, and *Other Religion* are each coded 1 for the appropriate religious affiliation and 0 for all others, with atheists, agnostics, and those with no religious affiliation comprising the reference category for this set. *East*, *Midwest*, and *South* are coded 1 for respondents living in the respective census region and 0 for all others, with those from western states as the reference category for this set. *Urban* and *Rural* are coded 1 for those from the appropriate census-defined place of residence and 0 for all others, with suburban as the reference category for this set. *Retired*, *Homemaker*, *Executive/Professional*, *Clerical*, and *Technical/Sales* are coded 1 for the respective occupational status and 0 for all others.

Political Information

The information measures used in this study were originally constructed and tested by Delli Carpini and Keeter (1993, 1996). These scales are primarily additive measures of correct answers to factual knowledge questions (correct = 1; incorrect or no answer = 0). They also incorporate a subjective assessment of respondent knowledge level made by the interviewer at the conclusion of each interview. Three kinds of factual knowledge items were used to construct these scales: relative location tests, in which correct answers are constructed by comparing responses to two different questions; open-ended questions asking respondents to identify the job or political office held by a public figure; and closed-ended questions testing knowledge of constitutional powers, which party held majority status in both houses of Congress, and which party was more conservative than the other. An example of a correct answer to a relative location test is placing the Republican Party as relatively more conservative than the Democratic Party on a seven-point ideology scale, regardless of where on the ideology scale a respondent actually places the two parties.

Besides the interviewer rating score (v555, reverse coded), the questions for the 1988 NES information scale included identifying the offices held by Ted Kennedy (v871), George Shultz (v872), Margaret Thatcher (v875), Yasser Arafat (v876), William Rehnquist (v873), Mikhail Gorbachev (v874), and Jim Wright (v877); naming the majority party in the House (v878) and Senate (v879); identifying the relative ideological locations of Bush and Dukakis (v231, v232), identifying the relative ideological locations of the Republican and Democratic parties (v234, v235), and locating the relative positions of the Republican and Democratic parties on national health insurance (v321, v322), government services (v307, v308), defense spending (v315, v316), and job assurances (v328, v329).

Aside from the interviewer rating score (v4205, reverse coded), the questions for the 1992 NES information scale included identifying the offices held by Dan Quayle (v5916), William Rehnquist (v5917), Boris Yeltsin (v5918), and Thomas Foley (v5919); identifying which branch of the federal government was responsible for deciding the constitutionality of laws (v5920) and for nominating federal judges (v5921); naming the majority party in the House (v5951) and Senate (v5952); identifying which was the more conservative party (v5915); identifying the relative ideological locations of Republicans and Democrats (v3517, v3518), Bush and Clinton (v3514, v3515); and identifying the relative position of the parties on government services (v3704, v3705), Bush and

Clinton on government services (v3702, v3703), the parties on defense spending (v3710, v3711), Bush and Clinton on defense spending (v3708, v3709), the parties on job assur-

ance (v3721, v3722), Bush and Clinton on job assurance (v3719, v3720), and Bush and Clinton on abortion (v3733, v3734).

APPENDIX B: SIMULATION RESULTS FOR INDIVIDUAL QUESTIONS

Table B-1. Levels of Actual Opinion and Simulated Estimates of Fully Informed Opinion, by Question

Question	Type	Year (Var #)	Actual Opinion	Simulated Opinion
"I am going to read you a statement about U.S. foreign policy and I would like you to tell me whether you agree or disagree: 'This country would be better off if we just stayed home and did not concern ourselves with problems in other parts of the world.' " (percent disagreeing)	Foreign	1988 (v254) 1992 (v3604)	71.1 73.7	81.6 85.8
"The United States and the Soviet Union have recently reached agreements to reduce the number of nuclear arms. Do you approve or disapprove of these agreements?" (percent disapproving)	Foreign	1988 (v364)	12.6	8.7
"Do you favor or oppose using American military forces in the Middle East to protect oil shipments?" (percent opposed)	Foreign	1988 (v366)	35.7	42.6
"Some people think that the U.S. should increase the pressure on the South African government to change its racial laws. Others think the U.S. should not do this. What do you think—should the U.S. apply more pressure or not?" (percent opposed to more pressure)	Foreign	1988 (v861)	41.3	34.5
"The U.S. should maintain its position as the world's most powerful nation even if it means going to the brink of war." (percent disagreeing)	Foreign	1988 (v972)	42.9	48.2
"Do you think we did the right thing in sending U.S. military forces to the Persian Gulf or should we have stayed out?" (percent saying should have stayed out)	Foreign	1992 (v3608)	21.0	18.4
"Some people think that the U.S. and its allies should have continued to fight Iraq until Saddam Hussein was driven from power. Others think that the U.S. was right to stop fighting after Kuwait was liberated. What do you think? Should the war have continued or should it have stopped?" (percent saying should have stopped)	Foreign	1992 (v3630)	36.7	35.4
"In order to reduce the size of the federal budget deficit are you willing or not willing to pay more in federal taxes?" (percent unwilling)	Fiscal	1988 (v249)	68.9	46.3
"The government ought to cut taxes even if it means putting off some important things that need to be done." (percent disagreeing)	Fiscal	1988 (v944)	64.5	78.0
"Some people say the U.S. should maintain its position as the world's strongest military power even if it means continuing high defense spending." (percent disagreeing)	Fiscal	1992 (v3603)	31.9	35.6
"Would you personally be willing to pay more in taxes so that the government could spend more on the services you favor or would you rather keep your taxes the same even if this meant the government couldn't increase its spending as you would like?" (percent saying keep taxes the same)	Fiscal	1992 (v5922)	70.0	52.9
"In your opinion, are Social Security retirement benefits too low, about the right amount, or too high?" (percent saying about right/too high)	Fiscal	1992 (v6132)	40.1	48.7
"Do you favor or oppose taxes on Social Security benefits?" (percent opposed)	Fiscal	1992 (v6134)	87.0	81.0

Table B-1. (continued)

Question	Type	Year (Var #)	Actual Opinion	Simulated Opinion
"Some people have suggested placing new limits on foreign imports in order to protect American jobs. Others say that such limits would raise consumer prices and hurt American exports. Do you favor or oppose placing new limits on imports, or haven't you thought much about this?" (percent opposed)	Operative	1988 (v376) 1992 (v3802)	23.7 33.1	39.7 38.5
"What is your feeling, do you think the government is getting too powerful or do you think the government is not getting too strong?" (percent saying government not getting too strong)	Operative	1988 (v848) 1992 (v6016)	36.7 29.9	29.2 31.1
"Over the past year would you say that the economic policies of the federal government have made the nation's economy better, worse, or haven't they made much difference either way?" (percent saying worse)	Operative	1992 (v3541)	43.2	60.0
"A law has been proposed that would limit members of Congress to no more than 12 years of service in that office. Do you favor or oppose such a law?" (percent opposed)	Operative	1992 (v3747)	18.5	19.8
"Choose which of two statements I read comes closer to your own opinion . . . One, the less the government the better; or two, there are more things that government should be doing?" (percent saying there are more things government should do)	Operative	1992 (v5729)	64.9	50.3
"Choose which of two statements I read comes closer to your own opinion . . . One, we need a strong government to handle today's complex economic problems; or two, the free market can handle these problems without government being involved?" (percent favoring free market)	Operative	1992 (v5730)	26.5	41.5
"Do you favor or oppose laws to protect homosexuals against job discrimination?" (percent opposed)	Social	1988 (v852) 1992 (v5923)	45.8 39.9	41.8 34.5
"Do you favor or oppose the death penalty for persons convicted of murder?" (percent opposed)	Social	1988 (v854) 1992 (v5933)	19.9 20.6	24.8 24.0
"Some people say that because of past discrimination, blacks should be given preference in hiring and promotion. Others say that such preference in hiring and promotion of blacks is wrong because it gives blacks advantages they haven't earned. What about your opinion—are you for or against preferential hiring and promotion of blacks?" (percent against)	Social	1988 (v856) 1992 (v5935)	79.9 79.9	83.1 84.0
"Should the government in Washington see to it that black people get fair treatment in jobs or is this not the federal government's business?" (percent saying this is not the government's business)	Social	1988 (v865) 1992 (v5938)	42.7 42.7	39.7 42.9
"Some people say that because of past discrimination it is sometimes necessary for colleges and universities to reserve openings for black students. Others oppose quotas because they say quotas give blacks advantages they haven't earned. What about your opinion—are you for or against quotas to admit black students?" (percent against)	Social	1988 (v869) 1992 (v5947)	63.7 67.4	65.8 68.4
"Equal opportunity for blacks and whites is very important but it's not really the government's job to guarantee it." (percent disagreeing)	Social	1988 (v965)	43.2	49.0
"Do you think the government should require companies to allow up to six months unpaid leave for parents to spend time with their newborn or newly adopted children, or is this something that should be left up to the individual employer?" (percent favoring decision left to employers)	Social	1992 (v3717)	68.8	63.0

Table B-1. (continued)

Question	Type	Year (Var #)	Actual Opinion	Simulated Opinion
"Would you favor or oppose a law in your state that would require parental consent before a teenager under 18 can have an abortion?" (percent opposed)	Social	1992 (v3735)	24.5	39.2
"Would you favor or oppose a law in your state that would allow the use of government funds to help pay for the costs of abortion for women who cannot afford them?" (percent opposed)	Social	1992 (v3737)	49.1	46.9
"Would you favor or oppose a law in your state that would require a married woman to notify her husband before she can have an abortion?" (percent opposed)	Social	1992 (v3739)	34.5	48.8
"Do you think government should provide child care assistance to low and middle income working parents, or isn't it the government's responsibility?" (percent saying government is not responsible)	Social	1992 (v3745)	38.8	40.3
"Do you think homosexuals should be allowed to serve in the United States Armed Forces or don't you think so?" (percent saying gays should not be allowed to serve)	Social	1992 (v5925)	41.4	37.2
"Do you think gay or lesbian couples, in other words, homosexual couples, should be legally permitted to adopt children?" (percent opposed)	Social	1992 (v5927)	72.3	59.0
"Do you think the government in Washington should see to it that white and black children go to the same schools, [or that it should] stay out of this area as it is not the government's business?" (percent saying government should stay out)	Social	1992 (v5932)	50.8	59.5
"Some people feel that we should use government funds only to support children who go to public schools, others feel that we should use government funds to support children's schooling regardless of whether their parents choose to send them to a public, private, or parochial school. How do you feel, or haven't you thought much about it?" (percent in favor of funding all schooling)	Social	1992 (v6023)	42.9	33.5
"Do you favor or oppose expanding Medicare to pay for nursing home care and long hospital stays for the elderly?" (percent opposed)	Social	1992 (v6136)	12.0	21.5
"Do you favor a law making English the official language of the United States, meaning government business would be conducted in English only, or do you oppose such a law?" (percent opposed)	Social	1992 (v6233)	30.6	28.7
"Do you think that immigrants who come to the U.S. should be eligible as soon as they come here for government services such as Medicaid, Food Stamps, Welfare, or should they have to be here a year or more?" (percent saying immigrants should wait a year or more)	Social	1992 (v6242)	78.9	70.8

New Models for New Labour: The Political Economy of Labour Party Support, January 1992–April 1997

HAROLD D. CLARKE *University of North Texas*

MARIANNE C. STEWART *University of Texas at Dallas*

PAUL F. WHITELEY *University of Sheffield*

This article uses newly available British time-series data to analyze dynamic interrelationships among Labour vote intentions, perceptions that the Labour leader would make the best prime minister, and Labour party identification. Error-correction models reveal that best prime minister perceptions and party identification have important short- and long-run influences on vote intentions. Tests of rival models indicate that personal economic expectations outperform other economic evaluations in the vote intention and party identification analyses. National retrospective judgments perform well in analyses of best prime minister perceptions, and emotional reactions to economic conditions significantly influence these perceptions as well as party identification.

Political parties can enjoy, as well as endure, remarkable reversals of fortune. The recent history of the British Labour Party provides an excellent example. In April 1992, Labour suffered its fourth consecutive general election defeat, and observers speculated that this might have been the party's "last chance" (e.g., Heath et al. 1994). Soon after that election, however, Labour support began to revive, and the governing Conservatives fell far and fast from public grace. Labour's resurgence was not ephemeral; rather, it continued and culminated in a spectacular victory in the May 1, 1997, general election.¹ In this paper, we analyze the dynamics of Labour's popularity surge by specifying new models of the political economy of party support. These models emphasize the short- and long-run effects of party leader images and party identification, as well as the influence of economic evaluations and emotional reactions to the economy, on Labour's vote intention share. The models thus depart from their predecessors, a large majority of which have relied heavily on a small set of macroeconomic indicators, especially inflation and unemployment rates, as principal explanatory factors (for reviews, see Lewis-Beck 1988; Miller 1989; Norpoth 1992). By incorporating variables that have received little or no attention in previous studies of aggregate

movements in vote intentions, the new models are designed to help bridge the longstanding theoretical gap between such studies and individual-level analyses of electoral choice.

We first review four important debates concerning the specification of aggregate vote intention models. After presenting time-series data on movements in Labour vote intentions, best prime minister perceptions, and party identification over the January 1992–April 1997 period, we investigate the time-series properties of, and interrelationships among, these three variables. These analyses inform the specification and testing of alternative error-correction models of Labour vote intentions. Next, models of judgments that the Labour leader would make the best prime minister and Labour party identification are analyzed. These analyses enable us to assess the direct and indirect effects of several important variables on Labour vote intentions and to test the exogeneity of best prime minister judgments and party identification vis-à-vis vote intentions. A final set of analyses employ hitherto unavailable time-series data on emotional reactions to national and personal economic conditions to explore alternatives by which the economy affects party support. The conclusion reviews major findings and briefly discusses their implications for understanding the dynamics and determinants of party support in Britain and elsewhere.

THE DEBATABLE DYNAMICS AND DETERMINANTS OF PARTY SUPPORT

Since its introduction nearly half a century ago (e.g., Campbell, Gurin, and Miller 1954; Campbell et al. 1960), the concept of party identification has stimulated continuing theoretical and methodological controversies among students of voting behavior in the United States, Britain, and other countries. According to its original social-psychological definition, party identification is an enduring element in the political psychology of party support and, as such, exercises important direct and indirect effects on electoral choice. In this conceptualization, party identification is

Harold D. Clarke is Regents Professor of Political Science, University of North Texas, Denton, TX 76203; Marianne C. Stewart is Professor of Political Economy, University of Texas at Dallas, Richardson, TX 75083; Paul F. Whiteley is Professor of Politics, University of Sheffield, Sheffield, UK S10 2TU.

We also thank Robert Wybrow, Rory Fitzgerald, and Sheri Weber of British Gallup for their very helpful advice and generous support, and Jim Granato and the anonymous reviewers for many useful comments and suggestions. Neither the NSF nor Gallup is responsible for the data analyses and interpretations of the data presented here. The data may be downloaded from the ICPSR Publication-Related Archive (Study #7309) or our website data archive—www.psci.unt.edu/~hclarke/.

¹ Labour won 418 seats, the Conservatives 165, the Liberal Democrats 46, and all other parties 29. The distribution of the popular vote (for the United Kingdom) was: Labour 44.4%, Conservatives 31.4%, Liberal Democrats 17.2%, all other parties 7.0%.

an affective attachment that an individual forms with a political party, typically as a result of early-life socialization processes (e.g., Campbell et al. 1960, chapters 6–7; Miller 1991). *Ceteris paribus*, party identification tends to be reinforced and to strengthen over time, and it thereby acts as a powerful long-term force anchoring voting behavior and party fortunes in successive elections (e.g., Campbell et al. 1966; Converse 1976). This view of party identification has not received unanimous endorsement. Since the early 1980s, it has been repeatedly challenged by scholars who argue that party identification should be conceptualized as a summary “running tally” of current and past party performance evaluations, with more weight being given to recent, as opposed to earlier, assessments (e.g., Fiorina 1981, chapter 5; see also Achen 1992; Franklin 1984, 1992; Franklin and Jackson 1983).² Because these evaluations can vary, sometimes markedly, individual- and aggregate-level partisan changes are ongoing possibilities.

At the aggregate level, MacKuen, Erikson, and Stimson (1989, 1136) have demonstrated that American “macropartisanship,” as measured by a question in monthly Gallup surveys, responds to voters’ economic evaluations and presidential approval ratings. Abramson and Ostrom (1991) have argued, however, that the Gallup party identification question is flawed and that the venerable party identification measure in the biennial American National Election Studies (NES) is affected only weakly by economic evaluations and not at all by presidential approval. Although this debate has continued for several years in the United States (e.g., Bishop et al. 1994; Box-Steffensmeier and Smith 1996; Clarke and Suzuki 1994; MacKuen et al. 1992), in Britain a lack of appropriate time-series data has prevented scholars from effectively addressing long-standing disagreements over the nature and extent of partisan change (e.g., Budge, Crewe, and Farlie 1976; Crewe 1986; Crewe, Sarlvik, and Alt 1977; Heath, Jowell, and Curtice 1985; Heath et al. 1991; Heath and McDonald 1988; Heath and Pierce 1992; Sarlvik and Crewe 1983). For the same reason, party identification variables have not appeared in models of the interelection dynamics of British parties’ vote intention shares.

A second debate concerns whether public reactions to party leaders affect vote intentions and electoral choice in Britain. Unlike the situation in the United States, the conventional wisdom in Britain has downplayed the significance of party leader images for explaining electoral choice (e.g., Butler and Stokes 1976, chapter 17; Crewe 1985; Dunleavy and Husbands

1985; Rose and McAllister 1990). Recent analyses of British Election Study and other election-survey data gainsay this received wisdom by demonstrating that leader images have strong effects on voting decisions (e.g., Crewe and King 1994; Miller et al. 1990; Stewart and Clarke 1992). These individual-level findings have been reinforced by the results of aggregate-level time-series analyses of the effect of prime ministerial approval ratings on governing party vote intentions (Clarke and Stewart 1995; Clarke, Stewart, and Whiteley 1997) and public perceptions of which leader would make the best prime minister (Nadeau, Niemi, and Amato 1996). Most of these aggregate-level analyses focus exclusively on governing (Conservative) party support, however, and the influence of party leader performance evaluations on opposition party vote intentions has not been studied extensively.³

A third controversy involves the effect of evaluations of national and personal economic conditions on party support. As noted, analysts traditionally have used inflation and unemployment rates and other objective indicators to investigate how the economy affects parties’ vote intention shares. Such variables are uninformative concerning the subject referent (self/society) or time horizon (past/future) voters employ when making their party support decisions. In recent years, the inclusion of subjective economic evaluations, that is, public judgments of national and personal economic circumstances, has done much to improve model specification. In this regard, the widely cited Essex model specifies that personal economic expectations and interest rates drive governing party support (Sanders 1991, 1993, 1995; Sanders, Marsh, and Ward 1993). Interest rates also exert indirect effects on party support via their strong influence on personal economic expectations. Some studies (Clarke and Stewart 1995; Clarke, Stewart, and Whiteley 1997), however, have shown that other kinds of economic evaluations (personal retrospections, national retrospections, national expectations) also perform well in models of governing party (Conservative) vote intentions. How various types of economic evaluations fare in models of opposition party support remains to be investigated.

A fourth debate concerns the distinction between evaluation and emotion and their effects on political decision making. In studies of the political economy of party support, these concepts often are conflated in such terms as the “misery index” and the “feel good factor,” which apply emotional labels to a combination of objective conditions (inflation and unemployment) and subjective evaluations (expectations about personal economic circumstances), respectively. But neither the misery index nor the feel good factor explicitly taps emotional responses to economic performance. This observation is important because some analysts forcefully argue that both evaluation and emotion should be incorporated into models of information processing and political support (Conover and Feldman 1986; see also Conover, Feldman, and Knight

² Formally, $PID_t = \sum \beta_{i,k} EVAL_{t-i,k} + \epsilon_t$, where PID_t is party identification at time t , $EVAL_{t-i,k}$ is a vector of current and past party performance evaluations, and ϵ_t is $\sim N(0, \sigma^2)$. If party performance evaluations are viewed as an infinite distributed lag in which the effects of prior evaluations decline at a geometric rate (λ), a Koyck transformation may be employed for estimation purposes, that is, $PID_t = \alpha(1-\lambda) + \sum \beta_{i,k} EVAL_{t-i,k} + \lambda PID_{t-1} + v_t$, where $v_t = \epsilon_t - \lambda \epsilon_{t-1}$. The model may be theoretically motivated as a partial adjustment process. If so, the error process is Gaussian. See, for example, Gujarati (1988, 519–21). Individual-level analyses using these types of models in the British context include Alt (1984) and Clarke and Stewart (1984).

³ See, for example, Norpoth (1992, chapter 9), and Nadeau, Niemi, and Amato (1996).

1986, 1987; Frank 1988; Marcus 1988; Marcus and MacKuen 1993; and Sniderman, Brody, and Tetlock 1991, 7–8, 20–7). These claims are provocative because models incorporating emotional reactions challenge the dominance of the rational choice paradigm, which either explicitly or implicitly undergirds much theorizing about how voters make party support decisions. As with party identification, a lack of suitable data has inhibited time-series analyses of the influence of emotional reaction variables on the aggregate dynamics of parties' vote intention shares.

We initiated a study in January 1992 to address these several debates. The study includes the standard sequence of questions on party identification from the British Election Study and a battery of statements measuring emotional reactions to national and personal economic conditions in British Gallup's monthly opinion polls (see Appendix). The inclusion of the British Election Study party identification battery avoids the controversy over question wording that has bedeviled research on the aggregate dynamics of partisanship in the United States. The emotional reaction items are ones used in pioneering research by Conover and Feldman (1986) (see also Marcus 1988, 740–1). The utility of data gathered by the party identification and emotional reaction questions is enhanced by the fact that the Gallup surveys regularly ask several questions concerning vote intentions, party leader performance judgments, evaluations of national and personal economic conditions, and perceptions of most important problems facing the country. We employ these monthly data to analyze alternative models of the determinants of Labour support over the January 1992–April 1997 period that culminated with the huge Labour victory in the May 1, 1997, general election.

MAPPING THE DYNAMICS OF LABOUR SUPPORT

Labour enjoyed large increases in public support after the party's defeat in the April 1992 general election. Although 35% voted Labour in that contest, exactly four years later 55% claimed that they would do so next time around (Figure 1). Although the *Labour Vote Intention Share* subsequently declined, in mid-April 1997 49% stated that they would cast a ballot for the party in a forthcoming general election. The substantial growth in Labour vote intentions was accompanied by large increases in the percentage of persons who thought that the *Labour Leader Would Make the Best Prime Minister* and the percentage who identified with the Labour Party. Regarding the former, one month after the 1992 election only 18% believed that former Labour chieftain Neil Kinnock was best suited to be prime minister (Figure 2). In every month after September 1992, however, Labour's leaders were favored over their Conservative counterpart, John Major. Labour's leadership edge grew dramatically when Tony Blair replaced John Smith, after the latter's untimely death in May 1994. Blair's lead over Major declined somewhat in the last seven months before the general election, but on the eve of that contest it remained a

FIGURE 1. Conservative, Labour, and Liberal Democrat Vote Intentions, January 1992–April 1997

healthy 11% (39% v. 28%). As for party identification, although Labour's partisan share did not vary as much as vote intentions or best prime minister judgments,⁴ it manifested substantial growth and a continuing dynamic between 1992 and 1997 (Figure 3), with the percentage of *Labour Identifiers* ranging from 30% (February 1992) to 47% (December 1994). In April 1997, 40% identified with the party.

Movements in Labour vote intentions, party identification, and best prime minister judgments were closely interrelated. Although Labour's vote intention percentage hovered above its partisan share virtually every month during the January 1992–April 1997 period, the two series tracked each other closely (Figure 4), and their overall correlation is strong ($r = +.66$). Judgments that the Labour leader would make the best prime minister moved in tandem with these two series. Correlations between these judgments, on the one hand, and Labour vote intentions and party identification, on the other, are $+0.87$ and $+0.70$, respectively. The substantial correlations among the three series suggest the possibility of important causal connections among them.

MODELING LABOUR VOTE INTENTIONS

Analysts studying the aggregate dynamics of party support often assume that their time-series data are stationary and, hence, can be analyzed in level form.⁵ This is not an innocuous assumption because, if the

⁴ The standard deviations (σ) for Labour vote intentions, perceptions of the Labour leader as making the best prime minister, and Labour party identification are 5.89, 6.65, and 3.73, respectively. As in the Labour case, the variation in Conservative and Liberal Democrat party identifications is much less than that for vote intentions and best prime minister judgments. The σ 's are 6.73, 9.61, and 4.34, respectively, for the Conservatives, and 3.54, 3.85, and 2.33 for the Liberal Democrats. The percentage of Labour identifiers ranges between 30 and 47, whereas the percentage range is 19 to 38 for Conservative identifiers and 7 to 18 for Liberal Democrat identifiers.

⁵ A time series is weakly stationary if its mean and variance are time invariant, that is, $E(x_t) = \mu$, $E(x_t^2) = \sigma^2$ for all t , and its

FIGURE 2. Party Leader Who Would Make the Best Prime Minister, January 1992–April 1997**FIGURE 3. Conservative, Labour, and Liberal Democrat Party Identification, January 1992–April 1997**

data are nonstationary, serious threats to inference arise. If the dependent and independent variables in a model are nonstationary, then "spurious regressions" may occur, with null hypotheses for regression coefficients being falsely rejected, even though the data generation processes for the variables being analyzed are wholly independent (e.g., Granger and Newbold 1974; Hendry 1980). Although investigators typically have reacted to this threat by differencing series believed to be nonstationary, this procedure necessarily ignores possible long-run relationships (e.g., Beck 1992, 1993). In certain circumstances, both problems may be addressed by specifying error-correction models that assess both short- and long-term relationships among variables of interest.⁶ An error-correction specification is implied if nonstationary series integrated of order one ($I[1]$) are cointegrated (Engle and Granger 1987). Cointegrated series are in a dynamic equilibrium in the sense that they tend to move together in the long run. Shocks that persist over a single period are "reequilibrated" or adjusted by this cointegrating relationship. In an error-correction model, the coefficient for the error-correction mechanism measures the speed at which this adjustment process occurs. Evidence for cointegration is provided by demonstrating that a linear combination of the nonstationary series is a stationary variable.

Although political methodologists have shown considerable interest in the possibility of modeling nonstationary, cointegrating series in error-correction form, the prior question of whether series of interest are, in fact, nonstationary has provoked continuing controversy (e.g., Durr 1993a, 1993b; Ostrom and Smith 1993; Smith 1993; Williams 1993; see also Box-Steffensmeier and Smith 1996). The low power of diagnostic (unit-root) tests against local alternatives (e.g., Stock 1991) both stimulates these debates and hinders their reso-

lution. Recognizing this problem, some analysts (e.g., Beck 1993) have argued on theoretical and statistical grounds that a number of the series of longstanding interest (e.g., presidential approval) likely are stationary but near-integrated⁷ and, hence, long-memory. In this regard, DeBoef and Granato's (1997a) Monte Carlo study demonstrates that in finite samples, near-integrated series mimic the behavior of nonstationary ones, so that analyzing such series in level form risks spurious regressions (see also Banerjee et al. 1993, 26–7; Hamilton 1994, 444–7). This study, however, also shows that regressions using near-integrated series in (first) differenced form avoid this threat. DeBoef and Granato's results recommend that the series considered here should not be analyzed in level form because unit-root tests (Dickey and Fuller 1979) (see Table 1) and other diagnostics (autocorrelation functions, univariate ARIMA models, visual inspection of graphs) indicate that these series are either nonstationary or long-memory.⁸

In finite samples, both nonstationary and long-memory series may have long-run relationships that can be usefully modeled in error-correction form (Beck

autocovariances $E(x_{t-1} - \mu, x_{t-j} - \mu) (i \neq j)$ depend only on the length of the time lag, k , separating i and j (Hendry 1995, 42).

⁶ On the conceptual development and interpretation of error-correction models, see Alogoskoufis and Smith (1995); Hendry (1995, 286–306).

⁷ A near-integrated process can be specified as: $y_t = \rho y_{t-1} + \zeta_t$, where ζ_t is a Gaussian error process, $|\rho| = 1 + \epsilon$, and ϵ is a small, negative number. For example, the data-generating process (dgp) for a near-integrated series might be $y_t = .99y_{t-1} + \zeta_t$. Given this dgp, stochastic shocks erode only very slowly, and thus y_t is said to have long memory.

⁸ In an analysis of governing (Conservative) vote intentions over the July 1979–April 1992 period, Clarke and Stewart (1995, 158) report similar results for unit-root tests for the economic evaluation variables. Since party identification questions were not asked in monthly Gallup surveys prior to January 1992, unit-root tests for this variable are necessarily confined to the present sample. Given the importance that some observers have ascribed to the currency crisis as a factor that precipitated the Conservatives' loss of public support, we replicated the unit-root tests using a dummy currency crisis variable to control for a possible structural break in the several series. As Perron (e.g., 1989, 1990) argues, structural breaks can confound unit-root tests, prompting analysts to conclude (falsely) that their series are nonstationary. Perron's modified unit-root tests that control for a possible structural break (at a known date, here September 1992) indicate all series are nonstationary. See Perron (1990, 158) for critical values for this test.

FIGURE 4. The Dynamics of Labour Support, January 1992–April 1997

1993, 241; DeBoef and Granato 1995, 1997b). Here, we specify an error-correction mechanism to capture such a relationship among Labour vote intentions, on the one hand, and Labour leader as best prime minister and Labour party identification, on the other. The existence of such a relationship is consonant with the aforementioned theoretical literature on the centrality of party identification in the matrix of forces affecting electoral choice, as well as the results of individual- and aggregate-level analyses of the determinants of voting behavior and vote intentions in interelection periods (see pp. 559–60 above).

Empirical evidence consistent with the presence of a long-run cointegrating relationship among these three variables is provided by Engle and Granger (1987) “two-step” and Engle and Yoo (1991) “three-step” procedures. The two-step procedure involves regressing Labour vote intentions on Labour leader as best prime minister and Labour party identification, and then testing the residuals for nonstationarity. This regression indicates that the best prime minister and party identification variables have strong, statistically significant, and properly signed (i.e., positive) effects on Labour vote intentions (Table 2). Also, as should be the case if the series in question cointegrate, a unit-root test shows that the residuals from this regression are a stationary ($I[0]$) variable. Estimates computed using the three-step procedure proposed by Engle and Yoo (1991, 257–63) confirm the statistical significance of the regression coefficients,⁹ and, again, unit-root tests indicate the regression residuals are stationary (Table 2).

In addition to incorporating variables that capture the short- and long-term effects of best prime minister judgments and party identification on Labour vote intentions, the error-correction model includes mea-

⁹ The three-step estimates are asymptotically equivalent to full-information maximum likelihood (Engle and Yoo 1991, 257). See also Harris (1995, 56).

asures of subjective economic evaluations.¹⁰ We hypothesize that such evaluations are inversely related to support for Labour as the principal opposition party—as economic judgments become increasingly negative, Labour support grows, and, as they become increasingly positive, it diminishes. As discussed above, four types of economic evaluations (*Personal Expectations*, *National Expectations*, *Personal Retrospections*, and *National Retrospections*) that have figured prominently in debates concerning how economic conditions affect party support are employed in four variants of the model. Other economic variables used are *Interest Rates* and the percentages citing *Unemployment* and *Inflation* as the *Most Important National Problems*. Interest rates play a prominent role in the aforementioned Essex model, whereas the latter two variables index the salience in the public mind of two aspects of the macroeconomy (rates of joblessness and price hikes) that traditionally have been seen as important influences in the political economy of party support.

¹⁰ Cointegration tests involving the three Labour series and various economic series (considered one at a time) demonstrate that none of the latter is involved in a cointegrating relationship with the former.

TABLE 2. Cointegrating Regression: Labour Vote Intentions by Labour Leader as Best Prime Minister and Labour Party Identification, January 1992–April 1997

Regressor Variables	β	s.e.
Labour leader	.635 (.737)	.083*** (.269)**
Labour party identification	.585 (.488)	.078*** (.254)*

$R^2 = .709$

$N = 64$

Note: Engle and Yoo (1991) three-step estimates in parentheses. * $p \leq .05$; ** $p \leq .01$; *** $p \leq .001$; one-tailed tests. Unit-root test for residuals = -3.59, rejects null hypothesis of nonstationarity at .05 level (critical value = -3.44).

Hypotheses concerning the effects of these variables are straightforward: As interest rates and public concern about inflation and unemployment increase, support for the opposition Labour Party grows; when interest rates fall and public concern about prices and joblessness subsides, Labour support does so as well.

The vote intention models also include two other "most important problem" series, *Education* and *Health Care*, to tap levels of public concern with two issues emphasized by Tony Blair after he became Labour leader. Both issues grew in prominence as the 1997 election drew closer, and both were stressed by Labour in the election campaign. It is hypothesized that Labour vote intentions will vary positively with the percentages mentioning education and health as most important problems. Finally, we include several dummy variables that index highly salient events hypothesized to have affected Labour support since 1992. Events expected to exert a positive influence include the Black Wednesday *Currency Crisis* in September 1992,¹¹ the Conservatives' 1993 *Intraparty Divisions over the Maastricht Treaty*,¹² the 1994 *European Elections/Death of John Smith*,¹³ the spring 1996 revelations of a possible link between bovine spongiform encephalopathy and Creutzfeld-Jakob disease in humans (the "*Mad Cow*" *Crisis*),¹⁴ and the widely publicized *Conservative "Sleaze" Scandals* occurring at the beginning of

the general election campaign in March 1997.¹⁵ Events expected to have a negative effect include the *July 1995 Reselection of John Major as Conservative Leader*,¹⁶ the February 1996 disclosure that Labour's shadow cabinet education spokesperson, Harriet Harman, had enrolled her child in a private school (*Harman Affair*),¹⁷ and the Conservatives' anti-Labour media blitz and the intraparty bickering that surrounded Labour's 1996 shadow cabinet election and subsequent October 1996 annual conference (*Labour Conference*).¹⁸ All of these events, except the currency crisis and the annual conference, are modeled as short-term effects.¹⁹

In equation form, the Labour vote intention models are:

$$\begin{aligned} \Delta LAB_t = & \beta_0 + \beta_1 \Delta LBPM_{t-i} + \beta_2 \Delta LPID_{t-i} \\ & + \beta_3 ECM_{t-1} + \beta_4 \Delta ECEV_{t-i} + \beta_5 \Delta INTR_{t-i} \\ & + \beta_6 \Delta INIP_{t-i} + \beta_7 \Delta UMIP_{t-i} + \beta_8 \Delta EDIP_{t-i} \\ & + \beta_9 \Delta HEIP_{t-i} + \sum \beta_{10-k} EVENTS_{t-i} + \epsilon_t, \quad (1) \end{aligned}$$

where LAB = Labour vote intentions; LBPM = Labour leader as best prime minister; LPID = Labour party identification; ECM = error-correction mechanism; ECEV = one of four subjective economic evaluations; INTR = interest rates; INIP, UMIP, EDIP, HEIP = perceptions of inflation, unemployment, education, and health as most important problems;

benefited Labour by making Prime Minister Major and his cabinet colleagues appear weak and indecisive (Denver 1998, 43–4).

¹⁵ Immediately after the campaign began, the Conservatives were buffeted by a series of sex and bribery scandals. Two MPs resigned, but two others refused to do so (Whiteley 1997, 550).

¹⁶ Under heavy fire from Eurosceptic opponents in his party, Prime Minister Major attempted to bolster his support by resigning as party leader in June 1995 and standing for reelection. When he defeated his Eurosceptic opponent, John Redwood, internecine squabbling in the party continued, but calls for his resignation ceased (Denver 1998, 24–6).

¹⁷ The disclosure received wide publicity and earned Harman the appellation "Harriet Hypocrite" because she had contradicted her professed emphasis on the desirability of public education. Critics within the Labour Party used the episode to fuel their arguments that a New Labour government would abandon the party's historic egalitarian ideological goals.

¹⁸ The Conservative campaign featured so-called Demon Eyes billboards, which displayed huge pictures of Tony Blair with glowing red eyes and a demonic grin. The picture was accompanied by the proclamation, "New Labour—New Danger." Subsequent advertisements had slogans such as "New Labour—New Taxes" and "New Labour—Euro Danger." At the same time, intraparty disputes surrounding the shadow cabinet election exposed policy/ideological fissures and personality conflicts in the Labour Party, and prompted speculation that these would be exacerbated should Labour form the next government. Similar conflicts emerged at the party's annual conference in October.

¹⁹ Short-term effect dummies are coded +1 in the months when the event occurs, -1 in the next month, and 0 otherwise. Long-term effect dummies are coded +1 in the month when the event occurs, 0 otherwise. Given that the dependent variable (vote intentions) is first-differenced, long-term effects would be permanent except for the presence of the error-correction mechanism, which erodes these effects at a rate estimated by the coefficient for the error-correction mechanism term in the vote intention model. Since the dependent variables in the best prime minister and party identification models are differenced, and these models do not contain an error-correction mechanism, events coded 0, 1, 0 will exert permanent effects.

¹¹ In response to intense pressure on sterling, and after vigorous denials that it would do so, the Conservative government abruptly left the European Union's Exchange Rate Mechanism (ERM) and devalued the pound on September 16, 1992. The crisis sharply eroded public confidence in Prime Minister Major and his government, while emboldening "Eurosceptics" in the Conservative caucus (Denver 1998, 17–20; see also Sanders 1995).

¹² Conservative divisions over Europe were widely publicized by the government's protracted difficulties in passing a bill implementing the Maastricht Treaty. After a year-long struggle, the bill received Commons approval on May 20, 1993 (Norton 1998, 82–4).

¹³ John Smith, who had replaced Neil Kinnock as Labour leader after the 1992 general election, died suddenly in late May 1994, thus focusing public attention on Labour and the possibility that the party would select a popular figure such as Tony Blair as its new leader. Soon afterward, the June 1994 elections for the European Parliament provided further positive publicity, as Labour trounced the Tories by a 44% to 27% margin (Denver 1998, 37–8).

¹⁴ The government's attempts to deal with the widely publicized problem, including initial denials of a health threat to humans and hollow threats to other EU countries for boycotting British beef,

X = variable not included in model.

Note: Dependent variable, Labour vote intentions, is first-differenced. * $p \leq .05$; ** $p \leq .01$; *** $p \leq .001$; one-tailed tests.

EVENTS = salient pro/anti-Labour events; ε_t = stochastic error process ($\sim N(0, \sigma^2)$); Δ = difference operator; β_0 = constant; and β_{1-k} = regression coefficients. The error-correction mechanism (ECM) is measured as the residuals from the cointegrating regression, that is, $ECM = LAB_t - \alpha_1 LBPM_t - \alpha_2 LPID_t$. Although theory does not delineate the exact time lags at which various continuous variables influence Labour vote intentions, it is plausible that any delayed effects will occur at short lags. Thus, alternative preliminary specifications are assessed using contemporaneous (time t) effects and those operating at lags of 1 through 3 periods. Model parameters are estimated using OLS regression.

Preliminary analyses indicate that one of the shock variables, the currency crisis, did not have a significant effect on Labour vote intentions. Accordingly, this variable was omitted, and the four variants of the model were reestimated. The results (Table 3) show that, as hypothesized, both Labour leader as best prime minister and Labour party identification have significant short-term effects on Labour vote intentions.

Considering the personal expectations version of the model, parameter estimates indicate that a 1% increase in the percentage of persons believing Tony Blair or his predecessors would make the best prime minister raises the party's vote intention share by .27%, whereas a 1% increase in the cohort of Labour party identifiers boosts it by .19%. When interpreting the substantive importance of these statistics, recall that both the percentage of persons believing that the Labour leader would make the best prime minister and the percentage of Labour identifiers rose substantially (by 31 and 17 points, respectively) during the period of interest. Ceteris paribus, the former increase is sufficient to boost the Labour vote intention share by 8.4% (.27 $\times$ 31), whereas the latter is enough to raise it by 3.2% (.19 $\times$ 17).

Regarding other predictors, economic variables in the personal expectations version of the model operate as anticipated, with Labour voting support varying positively with the percentages of persons mentioning inflation or unemployment as most important national problems, and inversely with the balance of positive

versus negative personal economic expectations. But, contrary to expectations, Labour electoral support is not associated with the salience of education and health care as national problems. As for various events, Major's reelection as party leader in July 1995 and the Harman affair in February 1996 each temporarily lowered Labour support by approximately 3%. Labour's internecine bickering during its shadow cabinet election and 1996 annual conference had slightly larger negative effects, with the latter persisting through the end of the period. Not all shocks were negative: Labour support was raised temporarily by more than 4%, as a result of the 1994 local elections/death of John Smith; by nearly 2% due to the 1996 Mad Cow scare, and by more than 5% owing to sleaze allegations against Tory MPs.

The error-correction mechanism also is statistically significant, and consistent with the idea that it is a reequilibrating or negative feedback device, its coefficient is negative. Its modest size (e.g., -0.15 in the personal expectations model) indicates that factors affecting Labour voting support could have a relatively long "half-life." *Ceteris paribus*, their influences were eroded by the long-term cointegrating relationship among voting support, best prime minister, and party identification at a rate of 15% in each subsequent month after they occurred. For example, consider the 3.93-point negative shock to Labour's vote intention share that occurred in October 1996 (refer to Table 3). That shock cost Labour 3.34 points the next month ($3.93 - (3.93 \times .15)$) and 2.84 points two months later ($3.34 - (3.34 \times .15)$).²⁰ The slow decline continued, such that six months after the shock occurred, on the eve of the May 1997 general election, its effects were still operative, reducing the Labour vote by 1.48 points. If the initial effect had been larger, the delayed effects would have been as well. For instance, a ten-point negative shock to Labour support in October 1996 would have cost the party 4.4 points the following April.

Viewed more generally, the personal expectations model of Labour vote intentions performs quite well. As Table 3 shows, the model has a reasonably good fit (adjusted $R^2 = .67$, $see = 1.74$), and tests for residual autocorrelation, heteroskedasticity, functional form, and normality have acceptable, that is, statistically insignificant ($p > .05$), values. Additional diagnostics focusing on the estimates of the long-run effects of the best prime minister and party identification variables²¹

and a change in survey methods in January 1997²² bolster confidence in the model.

The attractiveness of the personal expectations model is further enhanced by the finding that none of the other three types of subjective economic evaluations has a statistically significant effect (refer to Table 3, personal retrospections, national retrospections, and national expectations models). Moreover, although these rival specifications do well in terms of the behavior of most other individual predictors, overall fit, and residual diagnostics, the superiority of the personal expectations variant is suggested by its performance on a battery of encompassing tests (Hendry 1995, chapter 14; see also Charemza and Deadman 1997, chapter 8). The intuition motivating these tests is that if a model is superior to (nonnested) alternatives, it should explain all the features of the data that the alternatives explain and additional ones as well. If a model is able to accomplish this task, then it is said to encompass its rivals. Here, encompassing tests²³ indicate that the personal retrospections, national retrospections, and national expectations models are encompassed by the personal expectations model, but do not encompass it (at the .01 level; data not shown). Overall, these results, unlike those reported in recent studies of Conservative support (Clarke and Stewart 1995; Clarke, Stewart, and Whiteley 1997), are consonant with the Sanders (1991, 1993) thesis that personal economic expectations deserve "pride of place" in vote intention models.

BEST PRIME MINISTER AND PARTY IDENTIFICATION

To untangle the skein of forces affecting the short- and long-term dynamics of Labour vote intentions, we next consider the determinants of perceptions of the Labour leader as making the best prime minister and Labour party identification. We again investigate the effects of different economic evaluations in four alternative model specifications. Other predictor variables in the best prime minister models include party identification, interest rates, perceptions of inflation, unemployment, education and health care as most important national problems, and various salient events. Since Labour has had three leaders during the period under consideration, two of these latter variables are designed to capture public reactions to the two leadership changes (from *Kinnock to Smith* in July 1992 and from *Smith to Blair* in July 1994). Other event variables in the best

²⁰ These are direct, not total, effects; the October 1996 shock also had an indirect influence on Labour vote intentions via its influence on perceptions that Tony Blair would make the best prime minister and Labour party identification.

²¹ When all parameters in the error-correction models were estimated in a single step (see Banerjee et al. 1993, chapter 7; Beck 1993), the results are very similar to those in tables 2 and 3. For example, in the personal expectations version, the one-step coefficients for the long-run effects of the best prime minister and party identification variables are .773 and .533, respectively, and the adjustment coefficient for the error-correction mechanism is $-.148$. One cannot reject the null hypothesis that these coefficients are equal to those estimated by the two-step method ($\chi^2 = 3.51$, $df = 3$, $p = .320$). Also, one cannot reject the more general null hypothesis that

all coefficients estimated by the one-step procedure are equal to their two-step counterparts ($\chi^2 = 4.00$, $df = 17$, $p = .999$).

²² Gallup switched from in-person interviews with quota samples to telephone interviews with respondents selected by a random-digit dialing technique in January 1997. To ascertain whether the change was consequential, the four vote-intention models were reanalyzed, including a dummy variable scored 1 for the January–April 1997 period, 0 otherwise. In all cases, the coefficient for this variable was small ($< .50$) and insignificant, and all other coefficients and standard errors remained very similar to those presented in Table 3. The models also were reestimated terminating the time series in December 1996; again, changes in the estimates were trivial.

²³ For details regarding these tests, see Pesaran and Pesaran (1997, 355–7).

X = variable not included in model.

Note: Dependent variable, Labour leader as best prime minister, is first-differenced. * $p \leq .05$; ** $p \leq .01$; *** $p \leq .001$; one-tailed tests.

prime minister models include the currency crisis (permanent effect), John Major's reselection as Tory leader (permanent effect), a postelection "Antihoneymoon" for Neil Kinnock, who led the party to defeat in 1992 (temporary effect), the Harriet Hypocrite and Mad Cow affairs (temporary effects), the shadow cabinet and party conference bickering (temporary and permanent effects, respectively), and the Conservative sleaze revelations (temporary effect). Since the Labour leader as best prime minister and Labour party identification series are judged to be integrated (I[1]), they are analyzed in first-differenced form.

Preliminary analyses indicate that interest rates and Tory sleaze do not have significant effects in the best prime minister models. Models omitting these variables perform well—they explain substantial amounts of the variance in the dependent variable (adjusted R^2 ranges from .65 to .69), and they pass the extensive battery of residual diagnostic tests (Table 4). Several predictor variables perform as advertised. The leader-

ship change from Smith to Blair was particularly profound: Net of all other considerations, the selection of Tony Blair prompted a permanent 13–15% upward shift in the percentage of persons believing the Labour leader would make the best prime minister. The currency and Maastricht crises and the Mad Cow scare had smaller positive effects (2–6% in each case). Several negative shocks also are significant: The party's 1992 election defeat, the Harriet Hypocrite affair, and the shadow cabinet squabbling all prompted one-month decreases ranging in size from 4 to 8%. Major's reelection as Tory leader and negative publicity at the time of the 1996 party conference both exerted permanent negative effects of 4 to 5%.

Subjective economic evaluations also work as anticipated in the best prime minister models; as these evaluations become more sanguine, the percentage of voters selecting the Labour leader as best prime minister decline. Unlike the Labour vote intention analyses, all four types of economic evaluations have signif-

icant effects on best prime minister perceptions (Table 4). Encompassing tests reveal that the personal expectations model encompasses ($p < .05$) the personal retrospections and national expectations alternatives (data not shown). The personal expectations model does not fare as well against the national retrospections model; however, with most encompassing tests indicating that neither of these models is superior to its competitor. Thus, the evidence for personal expectations versus other types of economic evaluations in the best prime minister analyses is weaker than in the vote intention ones.

Variables in the party identification models are similar to those used in the vote intention and best prime minister ones, and once more we employ the four types of economic evaluations in separate analyses. Preliminary soundings indicate that perceptions of inflation as the most important problem and some events do not have significant effects. Reestimating the models without these variables reveals that the only significant subjective economic evaluation is personal expectations. As anticipated, its effect on Labour par-

tisanship is negative (-.11) (Table 5, personal expectations model). In contrast, interest rates and perceptions of unemployment, education, and health care as most urgent problems have the expected positive influences on the Labour identifier share; as rates increase and worries about joblessness, education, and health care grow, so does the size of the Labour partisan cohort. Perhaps most noteworthy is the large influence of the currency crisis, the immediate and lagged effects (see Sanders 1995) of which prompted an 11–12% increase in Labour party identification. Labour also benefited from the Tories' divisions over Europe (by 2–3%), the 1994 European elections coupled with the untimely death of John Smith (by 3+%), and the Mad Cow incident (by 3–4%). Negative influences on Labour partisanship include the Harman affair (a temporary decrease of 4–5%), the shadow cabinet squabbling (a temporary decrease of 2–3%), and the 1996 annual conference (a permanent decrease of 4–5%). Major's reelection as Tory leader was influential as well—occasioning a permanent 4–5 point decrease in the percentage of Labour identifiers.

Overall, the party identification models confirm the story conveyed visually by Figure 3: The upward movements in Labour partisanship after the 1992 election were both sizable and occasionally "lumpy," with the largest increases coming in the wake of highly publicized events (especially the currency crisis) that damaged the credibility of the governing Conservatives in the public mind. The party identification models also strengthen the case for personal economic expectations. These are the only type of economic evaluations to achieve statistical significance in these models, and encompassing tests indicate that the personal expectations variant encompasses its three rivals, but they do not encompass it (data not shown). The personal economic expectations coefficient ($-.11$) is not large in comparison with those for events such as the currency crisis, but when one considers the extent of variability in such expectations, the effect appears more impressive. Between January 1992 and April 1997, personal economic expectations varied by 44 points—*ceteris paribus*, this is sufficient to shift the Labour party identifier share by nearly 5%. Movements in Labour partisanship thus were produced by a combination of major events and less spectacular, but influential, ongoing changes (both positive and negative) in personal economic expectations.

Collectively, the models presented above tell a plausible story about the dynamics of Labour support after 1992. The plot is simple and straightforward, focusing on party identification and party leader evaluations as major players in the unfolding drama of Labour's impending electoral resurgence. But is it not possible that there are simultaneous causal linkages among these variables that would render model estimates suspect (biased and inconsistent)? Stated technically, can we demonstrate that Labour party identifications and judgments that the Labour leader would make the best prime minister are weakly exogenous to Labour vote intentions? Such a demonstration provides warrant for our causal inferences. Recall that a variable X_t is weakly exogenous to another variable Y_t if the latter affects the former only with a lag of at least one period (e.g., Charemza and Deadman 1997, chapter 7; see also Ericsson and Irons 1994). If Y_t does not have a contemporaneous or lagged effect on X_t , that is, if there is both weak exogeneity and Granger noncausality, then one can say that X_t is strongly exogenous to Y_t . Strong exogeneity is not required for inferences about the effect of X_t on Y_t .

As Charemza and Deadman (1997, 228–30) observe, the test for weak exogeneity in an error-correction model specification has two steps. In the present context, one must first demonstrate that the error-correction mechanism is statistically insignificant in the models for best prime minister and Labour party identification. Then, one must show that the residuals for the latter models (from analyses that omit the error-correction mechanism) are insignificant in the model for Labour vote intentions. Empirically, the models pass both tests. Testing at the .05 level of probability, we find that the *t*-ratios for the error-correction mechanism in the personal expectations

variant of the best prime minister and Labour party identification models are -0.23 , and 1.27 , respectively. When the residuals from the best prime minister and Labour party identification models (absent the error-correction mechanism) are included as additional predictors in the Labour vote intention specification, they have *t*-ratios of .90 and 1.20, respectively. Statistically insignificant results also obtain in tests for the models using the other three types of subjective economic expectations. We therefore conclude that the best prime minister and party identification variables are weakly exogenous to vote intentions, and the inferences drawn from our Labour support analyses are warranted.²⁴

EMOTIONAL REACTIONS TO ECONOMIC CONDITIONS

As observed earlier, objective economic indicators, notably inflation and unemployment rates, traditionally have been accorded the status of prime movers in party support models. In recent years these variables have had to share space on the right-hand side of these models with measures of subjective economic evaluations. Although the latter have helped to articulate aggregate party support models with the microanalytical literature on factors affecting voting behavior and election outcomes, affective or emotional reactions to personal and national economic circumstances remain missing ingredients of model specification. Data on these reactions are now available, albeit for a slightly shorter (August 1992–April 1997) time frame than that considered above.

The monthly data show that British voters' emotional reactions to the national economy more often have been negative than positive since August 1992. The dominant negative emotion expressed is *Uneasiness*, which overshadows feelings of *Anger*, *Disgust*, and *Fear* in every survey (Figure 5A). For example, at the time of the currency crisis in September 1992, 57% reported feeling uneasy about the country's general economic situation. In the most recent (April 1997) survey, 44% said that they felt uneasy, whereas 14%, 13%, and 11% said that they were angry, disgusted, and afraid, respectively. With regard to positive emotional reactions to the national economy, respondents typically report feelings of *Hope* rather than *Confidence*, *Happiness*, or *Pride*. Moreover, as Figure 5B shows, hopeful feelings nearly doubled over the several months preceding the general election, climbing from 22% in August 1996 to 39% in April 1997. Other positive emotions about the national economy also

²⁴ Recent debates concerning the exogenous status of economic expectations in models of presidential approval (MacKuen, Erikson, and Stimson, 1996; Norpoth 1996a, 1996b) prompted us to conduct additional exogeneity tests for personal economic expectations in the Labour vote intention, Labour leader as best prime minister, and Labour party identification models. Exogeneity tests also were conducted for national economic retrospections in the best prime minister model. These tests required the development of models for these two types of economic evaluations. In all cases, exogeneity test statistics are insignificant ($p > .05$).

FIGURE 5. Emotional Reactions to National and Personal Economic Conditions, August 1992–April 1997

became more common during this period but remained at much lower levels. In April 1997, 15%, 9%, and 5%, respectively, claimed to be confident, happy, or proud about Britain's economic performance.

The finding that sociotropic evaluations tend to be less sanguine than egocentric ones (Clarke and Stewart 1995) has its counterpart in emotional reactions. The mean percentage of persons reporting uneasiness about the country's economic condition is 50% (range: 39–57%), whereas the mean percentage expressing unease about personal economic circumstances is 32% (range: 27–40%) (Figure 5C and 5D). Positive emotions display the opposite pattern; for example, the mean percentage stating they were hopeful about the national economy is 20% (range: 11–39%), with the comparable percentage for one's personal economic situation being 25% (range: 19–41%). Figure 6 summarizes the *Balance of Positive and Negative Emotional Reactions to National and Personal Economic Conditions* over the August 1992–April 1997 period. As illustrated, personal reactions were relatively more positive than national ones, with the overall balance of positive to negative emotions about the national economy consistently being in the negative zone (i.e., less than zero). There is no strong tendency, however, for the aggregate balance of emotional reactions to per-

sonal economic conditions to be positive; between August 1992 and April 1997 it hovered near the neutral point (zero) in most months and was in the negative zone in 24 of 57 instances.

Finally, note the sharp downward movements in the two summary variables at the time of the currency crisis

FIGURE 6. Balance of Positive and Negative National and Personal Emotional Reactions to the Economy, August 1992–April 1997

and their upward surges in the months preceding the 1997 election. These dynamics accord well with the argument that emotional reactions to national and personal economic conditions are potentially quite mutable (Marcus and MacKuen 1993, 675, 681; see also Sniderman, Brody, and Tetlock 1991, 7). Rather than being wholly governed by stable personality traits generating generalized positive or negative feelings, such reactions reflect dramatic, quickly unfolding, events (e.g., the currency crisis) as well as more slowly paced changes in the objective economy (e.g., the upturn in the British economy occurring in the year before the 1997 election).²⁵

Do emotional reactions to the economy provide leverage for explaining the dynamics of party support beyond that supplied by the several variables included in the models considered above? To answer this question, we incorporate the two summary indices of the balance of emotional reactions to national and personal economic conditions in models of Labour vote intentions, Labour leader as best prime minister, and Labour party identification. Given the relatively strong performance of personal economic expectations in the earlier analyses, we confine attention to models that include this variable. Since the emotional reactions series begin in August 1992, we consider the 57-month period from that date to April 1997, with the regression analyses covering slightly shorter time spans because of the use of differenced and lagged variables. Consistent with the idea that psychological variables should act either contemporaneously or with short lags, alternative specifications are entertained for emotional reac-

tions operating contemporaneously and with lags of one to three periods.

The results for the Labour vote intention models are disappointing; neither national nor personal emotional reaction to economic conditions achieves statistical significance (data not shown). The situation is different, however, for judgments that a Labour leader would make the best prime minister. Preliminary analyses indicate that perceptions of unemployment and inflation as most urgent national problems do not have significant effects in models in which the emotional reactions variables are present. Estimates for a best prime minister model that omits these variables are presented in Table 6. As shown, the balance of emotional reactions to national economic conditions has a properly signed (negative) and statistically significant ($p < .05$) effect, indicating that increasingly negative emotional reactions to the national economy are associated with a growing tendency to judge that the leader of the (opposition) Labour Party will make the best prime minister. In addition, the variables which were significant in the specification that did not incorporate national emotional reactions remain so, with most parameter estimates being similar to those reported above (refer to Table 4). Confidence in the national emotional reactions model is enhanced by the observations that model fit is quite good (adjusted $R^2 = .69$, $see = 2.05$) and all residual diagnostic test statistics have satisfactory, that is, statistically insignificant, values. The analysis also shows that emotional reactions to personal economic conditions do not fare as well. Although personal emotional reactions have a significant effect ($-.05$, $p \leq .05$) when national emotional reactions are omitted from the best prime minister model (data not shown), personal reactions are not significant when national reactions are included (Table 6).

Analyses of Labour party identification also reveal that emotional reactions to economic conditions are influential (Table 7). The coefficient measuring the effect of emotional responses to the national economy is slightly larger than the one for personal financial circumstances ($-.06$, $p \leq .05$ versus $-.05$, $p \leq .10$), and encompassing tests indicate the superiority of the model that includes the former variable. Moreover, similar to the best prime minister analyses, inspection of these party identification models shows that virtually all variables which exert significant and properly signed effects in the analyses that do not include the emotional reactions variables continue to do so when these variables are added (compare Table 5, personal expectations model, and Table 7). With the sole exception of one general test for heteroskedasticity ($p \leq .05$),²⁶ all fit statistics and model diagnostics have satisfactory values.

In sum, these analyses reveal that emotional reactions to economic circumstances influence aggregate

²⁵ Modeling emotional reactions to national economic conditions as a function of personal economic expectations, interest rates, unemployment rates, the currency crisis, and a first-order moving average error process (as suggested by preliminary diagnostics) yields the following results:

$$\begin{aligned} \Delta \text{BALNAT}_t = & .02 + .73 \Delta \text{FINANFT}_{t-1} - 7.76 \Delta \text{INTR}_{t-2} - \\ & (.79)(.18) \quad (2.70) \\ & 13.89 \Delta \text{UNEMP}_{t-1} - 27.00 \text{BLACK}_t + \varepsilon_t - .60 \varepsilon_{t-1} \quad \bar{R}^2 = .56 \\ & (7.54) \quad (7.51) \quad (1.2) \end{aligned}$$

where BALNAT = balance of positive and negative emotional reactions to national economic conditions, FINANFT = personal economic expectations, INTR = interest rates, UNEMP = unemployment rate, BLACK = currency crisis dummy, Δ = difference operator, and ε = error term ($\sim N(0, \sigma^2)$). These estimates (standard errors in parentheses) show that the currency crisis, interest rates, unemployment rates, and the currency crisis shock all have hypothesized statistically significant, negative effects on emotional reactions to the national economy. Personal economic expectations have the expected, significant, positive effect. A comparable model of emotional reactions to personal economic conditions shows that, although the currency crisis does not have a significant influence net of other factors, interest rates and unemployment rates have the anticipated negative effects, and personal economic expectations have the expected positive effect.

$$\begin{aligned} \Delta \text{BALPER}_t = & -.67 + .58 \Delta \text{FINANFT}_{t-1} - 3.92 \Delta \text{INTR}_{t-2} - 15.68 \Delta \text{UNEMP}_{t-1} - \\ & (.48)(.15) \quad (1.67) \quad (4.98) \\ & 6.16 \text{BLACK}_t + \varepsilon_t - .83 \varepsilon_{t-1} \quad \bar{R}^2 = .48 \\ & (7.21) \quad (1.09) \end{aligned}$$

where BALPER = balance of positive and negative emotional reactions to personal economic conditions, and other variables are as described above.

²⁶ The general heteroskedasticity test reported is that suggested by Breusch and Pagan (1979). An alternative test (White 1980) yields insignificant results for this analysis and all others reported in the article.

movements in perceptions of the Labour leader and Labour partisanship net of several other variables that have played prominent roles in previously articulated models of party support. Since analyses presented above demonstrate that judgments about Labour leaders' prime ministerial qualifications and Labour partisanship have important short- and long-term influences on Labour vote intentions, one may conclude that emotional responses to the economy exert indirect effects on the party's electoral support.

NEW MODELS FOR NEW LABOUR (AND OTHER PARTIES)

This article has considered four longstanding, unresolved, debates in the literature on the political economy of party support. One of these controversies concerns the nature and dynamics of party identification in contemporary mature democracies. The finding of sizable aggregate-level movements in party identification in Britain over the 1992–97 period accords well with a conceptualization of party identification as a summary of party performance evaluations that is updated over time as new information becomes avail-

able. Since recent evaluations may strongly contradict earlier ones, partisan attachments are potentially mutable factors in the set of forces that determine parties' electoral fortunes. The factors that cause change in party identification need not be cataclysmic; party identification in present-day Britain is influenced by both quotidian and extraordinary events and conditions.

A second debate concerns the influence of party leader image on electoral choice. Conventional wisdom concerning the unimportance of British party leaders notwithstanding, leader effects are important—there is a cointegrating relationship among perceptions of Labour leaders' prime ministerial qualifications, Labour party identification, and Labour vote intentions, and the former two variables exert significant long- and short-run effects on the latter. These findings testify to the key role that leader image and party identification play in the matrix of forces affecting parties' electoral support, and they suggest that aggregate-level vote intention models which omit leader image and party identification variables run serious risks of misspecification.

The third and fourth debates focus on how the

economy affects party and party leader support. Consonant with the tenets of the influential Essex model, personal economic expectations exercise significant influences on Labour vote intentions and Labour party identification, but other types of economic evaluations do not affect either of these variables. However, the case for personal economic expectations is not as clear-cut in analyses of which party leader would make the best prime minister. In these analyses retrospective judgments about the national economy perform as well as personal expectations. That the party leader analyses do not make a compelling case for personal expectations indicates that future studies should distinguish carefully between party and party leader support when testing hypotheses about the importance of various kinds of economic evaluations.

Economic evaluations are not all that matter, however. Contrary to the image of voters in the rational choice literature as coldly calculating utility maximizers, Labour's share of party identifiers and judgments that the party's leader would make the best prime minister reflect emotional reactions to national economic conditions. These reactions thus indirectly affected Labour vote intentions during the 1992–97 period preceding the party's dramatic return to power. Gauging the effect of emotional reactions to economic conditions in other political contexts is an important topic for future inquiry.

In conclusion, this article has two general messages concerning future research on the dynamics and determinants of public support for political parties. First, basing model specification on what data exist rather than what data are needed precludes testing rival models that address unresolved theoretical controversies over the forces shaping party support. Testing such models will require substantial and careful data-gathering efforts. These efforts can be expensive, and they require patience, but the alternative is the continued absence of time-series data on key variables. Second, more attention should be paid to important advances that have been made in the methods for analyzing time-series data. Particularly promising are procedures for investigating integrated and long-memoried processes. These procedures, in conjunction with others such as encompassing and exogeneity tests, provide significant leverage for delineating the short- and long-run determinants of party support. Used together, new data and new methods will do much to advance understanding of the processes that govern electoral choice and party fortunes in contemporary democracies.

APPENDIX: SURVEY QUESTIONS AND VARIABLES

Question batteries were included on monthly Gallup surveys conducted over the January 1992–April 1997 period using research funds provided by National Science Foundation (grants SES-9309018 and SES-9600018). The fieldwork was conducted under the direction of Robert Wybrow, Rory Fitzgerald, and Sheri Weber. Variables based on the survey questions include the following.

Labour Vote Intentions

(a) "If there were a General Election tomorrow, which party would you support?" (b) [If "don't know"] "Which party would you be most inclined to vote for?" Labour voting support in the electorate is calculated as the sum of the percentages of persons responding "Labour" to (a) or (b), with refusals and declared nonvoters excluded.

Labour Leader as Best Prime Minister

This variable is the percentage mentioning a Labour leader in response to the question: "Who would make the best Prime Minister, Mr. Major, Mr. Kinnock/Smith/Blair, or Mr. Ashdown?"

Labour Party Identification

This variable is measured as the percentage responding "Labour" to the question: "Generally speaking, do you think of yourself as Conservative, Labour, Liberal Democrat, or what?" The SNP and Plaid Cymru also are mentioned in Scotland and Wales, respectively.

Subjective Economic Evaluations

The variables are constructed by subtracting the percentage offering negative responses from the percentage offering positive ones to the following questions. (a) Personal expectations: "How do you think the financial situation of your household will change over the next 12 months?" (b) Retrospective evaluations of personal conditions: "How does the financial situation of your household now compare with what it was 12 months ago?" (c) National expectations: "How do you think the general economic situation in this country will develop over the next 12 months?" (d) Retrospective evaluations of national conditions: "How do you think the general economic situation in this country has changed over the last 12 months?" Response categories for these questions are: "get/got a lot better," "get/got a little better," "stay/stayed the same," "get/got a little worse," "get/got a lot worse."

Most Important Problems

Levels of public concern about inflation, unemployment, education, and health care are the percentages mentioning these issues in response to the question: "What would you say is the most urgent problem facing the country at the present time?"

Emotional Reactions to National and Personal Economic Conditions

National conditions: (a) "Please look at this card and tell me if any of the words on it [uneasy, hopeful, disgusted, angry, afraid, confident, happy, proud] describes your feelings about the country's general economic situation. [If yes] Which ones?" *Personal conditions:* (b) "Please look at this card again and tell me if any of the words on it describes your feelings about the financial condition of your household. [If yes] Which ones?" These questions were asked in January 1992 and in each of the August 1992–April 1997 surveys.

Mentions of "anger," "disgust," "fear," and "uneasy" are classified as indicating negative emotional reactions, and mentions of "confidence," "happiness," "pride," and "hopeful" as indicating positive emotional reactions. This positive-

negative classification is similar to the factor structures reported by Conover and Feldman (1986) and Marcus (1988). See also Marcus and MacKuen (1993). The aggregate summary measures of emotional reactions to national and personal economic conditions are constructed by summing the percentages of positive and negative reactions, and subtracting the latter from the former.

How Does Cabinet Instability Affect Political Performance? Portfolio Volatility and Health Care Cost Containment in Parliamentary Democracies

JOHN D. HUBER *Columbia University*

This article explores the relationship between cabinet instability and political performance in parliamentary democracies. I develop two theoretical arguments about how cabinet instability should affect government effectiveness, and I use these to define several measures of instability. The first argument suggests that instability in the partisan composition of cabinets should make it difficult for governments to adopt and implement new policy programs. The second argument suggests that instability in the partisan control of portfolios within the government (portfolio volatility) should make it difficult for cabinet ministers to obtain relevant information during policy formulation and implementation. I test both arguments by examining the short- and long-run effect of the instability variables on success at health care cost containment. The analysis indicates that short-run increases in portfolio volatility present problems for government decision makers, but in the long run, unstable systems are able to address the problems that instability poses.

Does cabinet instability influence political performance in parliamentary democracies? If so, how does this occur? Previous research does not answer these questions because existing studies do not systematically examine instability as an explanatory variable. Instead, scholars have focused principally on instability as the variable to be explained (e.g., Laver and Schofield 1990; Powell 1982; Warwick 1979, 1994).

Studies of cabinet instability generally proceed by identifying the class of events that can be coded as government terminations, measuring government duration as the time between such events, and identifying factors that explain variation in government duration. Although this literature clearly identifies factors affecting government stability, it suffers from the fact that the first step in the process—identification of government terminations—typically proceeds with little or no theoretical foundation. Consequently, the events that are coded as government terminations are very diverse. The following cases are examples: (1) a single-party majority government replaces its prime minister; (2) a single-party majority government is replaced by a different majority party; (3) a coalition government of three parties resigns, and two of the parties reenter the government along with a new third party; (4) a coalition government loses a vote of confidence, but the same

parties form a new government after reshuffling portfolios; (5) a “surplus” party leaves an oversized coalition; and (6) a pivotal party leaves a majority government, resulting in a minority government.

Insofar as political scientists do not view cabinet instability as intrinsically important and care only about its effects on political behavior or government performance, treating these diverse events in the same way seems inappropriate. In fact, given the diversity of these events, even if one could establish an empirical link between instability (so measured) and political performance, it would be impossible to identify the precise mechanism by which such instability actually affects performance. It is not surprising, therefore, that confusion and disagreement exists about how to interpret the substantive importance of research on cabinet instability. Some scholars view the level of instability as a measure of poor political performance, and others consider instability irrelevant to understanding government performance.¹

This article seeks to increase our understanding of the relationship between cabinet instability and political performance. The analysis offers two theoretical arguments about how instability affects the capacity of governments to achieve their goals and uses these arguments to define appropriate measures of instability. The first argument is that cabinet instability makes it difficult for governments to develop the cohesion necessary for adopting and implementing new policy programs. This idea leads to a definition of cabinet instability that focuses exclusively on changes in the *partisan composition of the governing coalition*. The second argument is that instability makes it difficult for cabinet ministers to control civil servants during policy formulation and implementation. This idea leads to a

John D. Huber is Associate Professor of Political Science, Columbia University, New York, NY 10027.

The first draft of this article was prepared while I was a Robert Wood Johnson Scholar in Health Policy Research. I received helpful comments from several anonymous reviewers, Chris Achen, Larry Bartels, Nancy Burns, Mike Chernow, Jamie Druckman, Simon Hug, Catherine McLaughlin, Joseph Newhouse, Roy Pierce, and seminar participants at Columbia University, Harvard University, University of Iowa, University of Michigan, Michigan State University, and Washington University. Rob Franzese is due particular thanks for his patient advice and guidance on methodological issues. I received excellent research assistance from James Gutman, Mark Gromala, and Ryan Hudson. I am also grateful to the National Science Foundation for financial support.

¹ Among researchers who treat cabinet stability as a measure of political performance are Linz (1978), Powell (1982), and Strom (1990). Scholars who argue that there is no explicit link between cabinet instability (broadly defined) and political performance include Lijphart (1984a), Sartori (1994), Siegfried (1956), and Taylor and Herman (1971).

definition of instability, called portfolio volatility, that focuses on changes in the *control of policy portfolios within the government*. Measuring changes in the distribution of power within governing coalitions represents the most significant departure in this article from previous perspectives on cabinet instability.

I test the two arguments by examining the effect of the cabinet instability variables on government success at health care cost containment in 18 advanced industrial democracies. These tests, which are described and defended below, indicate that instability in the partisan distribution of portfolios—not the partisan composition of the government—has a substantial influence on political performance. The relationship between portfolio volatility and health care expenditure levels, however, exists only in the short run. The analysis suggests, therefore, that short-run increases in instability present problems for government decision makers, but in the long run, countries with high levels of instability are able to address the commitment and informational problems that it can pose. This finding has implications for future research on how policymakers craft institutional arrangements to address the problems created by instability.

PARTISAN CABINET STABILITY AND GOVERNMENT EFFECTIVENESS

The comparative literature has argued that cabinet instability can hinder government performance in two ways: by making it difficult for parties in government to develop the cohesion necessary to adopt new policies and by denying party leaders in the cabinet the power to follow through on implementing these policies. This argument is developed informally, is rarely made explicit, and takes different forms. All versions, however, focus on the importance of stability in the partisan composition of the cabinet.

The "Italian" version, for instance, argues that there are coalition formulae that last for a long time, providing a core of party leaders who can resolve disputes and push necessary legislation through parliament, regardless of the number of cabinet resignations that may occur over the life of a particular formulae (Dogan 1989; LaPalombara 1987; Spotts and Wieser 1986; Siegfried 1956 develops a similar argument about the French Fourth Republic). Suleiman (1974), to take another example, argues that continuity in the partisan composition of the government in France is important because it gives individual ministers the backing they need to deal with civil servants during policy formulation and implementation. Such collective cabinet support was essential, for example, to Edgar Pisani's successful reform of the agriculture bureaucracy in the 1960s, a success that had eluded the cabinet during the Fourth Republic (see Suleiman 1974, chapter 7). Lijphart (1984a) states that party stability in the government is a sign of executive strength vis-à-vis the parliament. Without such stability, he

argues, it is more difficult for the government to adopt desired policies.²

These arguments about the link between government effectiveness and stability in the party composition of the cabinet lead to a concept of cabinet instability that differs from typical definitions. The latter include all government resignations (or formal defeats), regardless of their effect on government composition. The research discussed above suggests that such resignations or defeats will have a significant influence on government performance only when they affect the party composition of the cabinet. I provide an operational definition of this partisan cabinet instability below.

PORTFOLIO VOLATILITY AND GOVERNMENT EFFECTIVENESS

A second line of argument uses intensive analyses of unstable systems (in particular, the French Third and Fourth Republic) to conclude that instability in certain portfolios makes it difficult for those ministers to control senior civil servants (Diamant 1959; Leuthy 1954; Scheinman 1965, 211; Suleiman 1974, chapter 7; Williams 1958, 405; Williams 1964, chapter 24; and Williams and Harrison 1960, 67). Such control is important because bureaucrats and cabinet ministers often have competing objectives (Aberbach, Putnam, and Rockman 1981; see also Scheinman 1965; Suleiman 1974, chapter 9; and Williams 1964). Portfolio volatility can add to these differences by giving bureaucrats substantial autonomy in how they organize their units, leading to the capture of agencies by narrow or special interests (see, in particular, two case studies in Suleiman 1974, chapter 7; see also Williams 1964, 378).

Why does portfolio volatility make it difficult for ministers to work with bureaucrats? Scholars have often focused on the role of information. Suleiman is most explicit:

One of the most important factors that determines the nature of the minister's relationship to his higher civil servants is the possession of information, and this factor is intimately linked to, and affected by, the relative stability or instability of the minister's tenure. Information is generally the monopoly of higher civil servants in the ministry, which can be eroded only if the minister *and* his cabinet remain in office for a sufficiently long time (Suleiman 1974, 165; see also 168–9).

The informational advantage that bureaucrats have over individual ministers in periods of instability enables bureaucrats to block ministerial policy initiatives by refusing to make timely reports (e.g., Suleiman 1974, 167–9; Williams 1964). It also makes it more difficult for ministers to monitor on-going civil service activities.

The argument about portfolio volatility diverges

² Simmons (1994) also argues that instability affects the ability of cabinets to act collectively, although her study of monetary policy focuses on presidential and authoritarian regimes, in addition to parliamentary systems.

significantly from other studies of cabinet government. The literature described in the previous section, for example, focuses on the dynamics of "who gets in" government, whereas the portfolio volatility argument focuses on the dynamics of "who gets what" within government. The portfolio volatility argument also differs from formal theories of portfolio distribution in cabinets, which assume that cabinet ministers can costlessly implement their most preferred policies (Austen-Smith and Banks 1990; Laver and Shepsle 1990, 1996). Changes in the distribution of cabinet portfolios, according to these models, do not create informational problems; rather, the redistributions should be viewed as rational responses to changes in the political environment (Laver and Shepsle 1996).

Given that the French studies were not developed with an eye toward offering general theoretical arguments, and given that they lead to conclusions that differ from much of the previous literature, there are reasons to be hesitant about cross-national application of the portfolio volatility argument. It is possible, however, to increase our confidence in the accounts from the French politics literature, and to sharpen our understanding of the dynamics that these accounts describe, by viewing them through the lens of signaling models of information transmission.

These signaling models have sought to explain the circumstances under which a "speaker" with private information (e.g., a civil servant) will reveal this information to a "receiver" (e.g., a cabinet minister) who must take actions that affect the utility of both the speaker and the receiver. The models provide a rich theory about factors affecting information transmission. In their seminal work, for example, Crawford and Sobel (1982) show that the receiver can typically learn from the speaker when the two individuals know that they share a common objective (in such cases, the speaker has no incentive to withhold information or to mislead). Uncertainty by the receiver about the preferences of the speaker has been shown to diminish the extent to which influential information transmission can occur (because the receiver can be less confident that s/he shares a common interest with the speaker) (Austen-Smith 1995; Sobel 1985). Similarly, repeated interactions improve the quality of information transmission (if a speaker expects future interaction with the receiver to be valuable, then the speaker will have obvious incentives to be honest in order to build trust for the future) (Sobel 1985). Finally, opportunities for low-cost ex post monitoring by a receiver make possible random audits of the truth of the sender's information, creating incentives for honesty (Banks 1989).

These abstract models make explicit the logic from the French politics literature. Obtaining reliable information should be easiest when a cabinet minister knows that s/he shares a common objective with civil servants, expects to be in a long-run relationship with them, and bears low costs of oversight. If a cabinet minister is new to a particular post, then s/he will often be uncertain about the preferences of civil servants. This uncertainty should decline as the minister's tenure increases, enabling the minister to learn on whom to

rely and creating opportunities for the minister to mold the civil service personnel (for example, by promoting individuals with similar preferences). Consistent with these arguments, Ramseyer and Rosenbluth (1993) argue that during much of the postwar period in Japan, the dominant Liberal Democratic Party was very successful in its use of hiring and promotion strategies in the civil service to promote its interests. In the French Fourth Republic, this was attempted, but instability made it very difficult to do (Suleiman 1974; Williams 1964).

Monitoring costs should increase with ministerial instability for two reasons. First, developing and evaluating new policy proposals takes time, and if a cabinet minister literally is not around to evaluate bureaucratic behavior, then monitoring costs will be prohibitive. Second, monitoring costs are affected by interest groups, which sound "fire alarms" that provide valuable information to legislators (or cabinet ministers) (Banks and Weingast 1992; McCubbins and Schwartz 1984). In order for such alarms to be effective, however, a legislator must be able to rely on the information provided by interest groups, and the informational problems faced by "unstable" ministers in their relationships with bureaucrats should also be present in relationships with interest groups. Not surprisingly, then, Suleiman (1974) and Williams (1964) report that interest groups in the Fourth Republic generally turned to civil servants rather than to cabinet ministers as their primary avenue for influencing policy outcomes.

Finally, an individual minister has to convince the other members of the cabinet that s/he has formulated a good policy and has effectively implemented existing policies. In this context, the cabinet minister becomes the speaker and the collective cabinet the receiver. Cabinet ministers will be most successful in conveying information to colleagues if they all know one another's preferences, expect to be in a relatively long-run relationship with one another, and know that the minister making a proposal has been able to obtain reliable information from civil servants.

In sum, the portfolio volatility argument suggests that the operational definition of instability should focus on changes in the identity of the ministers controlling specific cabinet portfolios. A precise definition of portfolio volatility is provided below.

SHORT- OR LONG-RUN EFFECTS?

The arguments outlined above indicate how partisan instability and portfolio volatility could hinder government effectiveness. These theoretical arguments are unclear, however, about whether the level of instability (or volatility) in a country, or sudden changes in this level, should affect performance. Scholars often focus on the level of instability. That is, they discuss instability as if it were a problem for the political system, the concern being that countries with relatively high levels of instability will have relatively low levels of government effectiveness. If this is true, then instability is said

to be in a long-run equilibrium relationship with performance.

As noted above, however, scholars of unstable systems often contend that instability does not create significant problems. If that view is correct, then the average level of instability in a country should not affect political outcomes. This does not imply, however, that the theoretical arguments are wrong. Instead, it may be that the average levels of instability do not affect government performance, but sudden changes in these levels do. Policymakers in a country, for example, may accommodate quite nicely a certain number of portfolio transfers each year but not a sudden increase in this number. If government effectiveness is influenced by changes in the level of instability, then the effect of instability on political performance is said to exist only in the short run.

The theoretical arguments are not sufficiently specific to sort out the short- versus long-run question. It is important to note, however, that if some countries are plagued by chronic instability, then one might expect policymakers in these countries to adopt institutional structures in cabinets and bureaucracies that respond to the problems instability can create. They may, for example, address the collective cabinet decision-making problems by creating policy institutions that take particular types of decisions out of politicians' hands. Or they may address informational problems by adopting institutional arrangements for gathering information that bypass civil servants. Such solutions, to which I return in the conclusion, should be imperfect and far from universally applicable across the wide range of issues that governments must address. But if government policymakers choose institutional arrangements that are sensible responses to the types of problems revealed by the two arguments discussed above, then short-run rather than long-run relationships between instability and performance should be most plausible.

MEASURING CABINET INSTABILITY AND PORTFOLIO VOLATILITY

We need appropriate measures of partisan cabinet instability and portfolio volatility in order to test the arguments described above. To test the partisan cabinet instability argument, I use a definition of cabinet instability that Lijphart (1984b) advocates. According to this definition, a government termination occurs when there is a change in the partisan composition of the governing coalition, which occurs if either (1) there is a change in the party composition of the government, or (2) there is no such change, but the government loses its majority (requiring the government to rely on external support parties). The more often such terminations occur, the more difficult it should be for governments to achieve their goals. In the analysis below, a country-year will be the unit of analysis, and the variable *Partisan Cabinet Instability* measures the number of times that the partisan composition of the governing coalition changes each year.

Before offering an operational definition of portfolio

volatility, it is important to address two conceptual issues. The first concerns the identity of the agent controlling cabinet portfolios: Is volatility in the names of individuals controlling portfolios or in the names of parties controlling portfolios more likely to have an adverse effect on policymaking? If one assumes that individuals cannot easily share information regardless of their party affiliation, then the appropriate unit of analysis is the individual. This should seldom be a reasonable assumption, however. Suleiman (1974), for example, argues that political parties (primarily through their role in staffing ministerial cabinets) help individuals within the same party overcome the problems associated with individual ministerial volatility (see also Ollé-Laprune 1962, 258). And the formal models suggest that even when different individuals from the same party do not wish to cooperate, an individual minister succeeding someone from his own party will benefit from the personnel decisions that the previous minister was able to make in the civil service (assuming the two ministers share similar policy preferences). When an individual replaces a minister from a different party, however, the previous minister should have fewer incentives to help the new one, and the new minister should be less likely to trust information provided by her predecessor. Thus, *Party Portfolio Volatility* should have a larger effect on governmental policymaking than individual volatility if one assumes relatively homogeneous preferences and fluid flows of information within parties.

A second conceptual issue regards the level of aggregation across different cabinet portfolios. Should we expect portfolio volatility to be a problem only if it occurs within the portfolios of cabinet ministers who have jurisdiction in the particular policy area, or should aggregate portfolio volatility also pose a significant problem? Since cabinet ministers typically have responsibility for policy formulation and oversight in particular policy areas, we should expect portfolio volatility to hinder the government when it occurs in the ministry responsible for the policy area under examination. But aggregate portfolio volatility should also affect policymaking. First, particular policies are seldom without jurisdictional overlap. Virtually all major policy decisions will involve the prime minister, the finance minister, and the minister with specific jurisdiction (such as justice or health). And policy decisions often involve more than one jurisdiction (such as the minister of education and the minister of health). Second, focusing on portfolio-specific volatility ignores bargaining problems in the cabinet. Even when an individual minister lasts a long time in her post (giving her advantages in relationships with civil servants), it should be more difficult for this minister to convince colleagues of which policies to adopt when these other ministers are new to their post. Third, a key factor affecting the ability of specific ministers to gain information and monitor effectively is the expectations of civil servants about the duration of a minister's tenure. We have little knowledge about how such expectations arise, but it seems quite plausible that the expectations of civil servants and interest groups about

TABLE 1. Correlations of Various Stability and Volatility Variables

	Total Portfolio Volatility	Within- Party Reshuffles	Party Portfolio Volatility	Ideological Portfolio Volatility	Partisan Cabinet Instability	General Cabinet Instability
Total Portfolio Volatility	1.0					
Within-Party Reshuffles	.54	1.0				
Party Portfolio Volatility	.89	.11	1.0			
Ideological Portfolio Volatility	.64	-.05	.78	1.0		
Partisan Cabinet Instability	.74	.13	.81	.69	1.0	
General Cabinet Instability	.83	.42	.75	.57	.75	1.0

Note: The entries in each cell are Pearson correlation coefficients. Data are from 18 countries, 1972–89. $N = 324$.

portfolio-specific volatility may emanate from more general expectations about the probability of any portfolio changing hands.

This article therefore examines several different measures of portfolio volatility, each of which can be operationalized at the aggregate and portfolio-specific level. For each measure, a country-year is the unit of analysis, and the portfolio volatility variables measure the number of changes in the control of portfolios. But the types of changes that count for each measure are different.

First, consider the various aggregate measures. *Total Portfolio Volatility* is the sum during one year of (1) the number of changes in the individuals controlling portfolios, (2) the number of portfolios added, and (3) the number of portfolios eliminated. Total portfolio volatility includes changes in the size of the cabinet, because such changes often influence relationships between cabinet ministers and civil servants. For example, the addition of new ministers creates relationships where none previously existed, and the elimination of cabinet posts leads to jurisdictional changes for the remaining ministers (and thus to new relationships between them and civil servants).

It is desirable to break down total portfolio volatility into its party and individual components. Party portfolio volatility has the same definition as total portfolio volatility, but it measures only changes that occur across parties (so that a change from Minister Smith to Minister Jones adds to volatility only if Smith and Jones are from different political parties). *Within-Party Reshuffles* refers to changes that occur across individuals within the same party. It is measured by subtracting party portfolio volatility from total portfolio volatility.

Ideological Portfolio Volatility takes account of the ideological distance that portfolios travel when they switch parties (a ministerial shift from, say, a Social Democrat to a Communist may create fewer problems than a shift from a Communist to a Conservative). This variable uses a ten-point Left-Right scale to measure the sum of the (absolute) changes in the ideology of each portfolio that is transferred across parties (assuming each member of the party is at the same Left-Right position), divided by the total number of portfolios transferred across parties in a year. For example, if a single party located at 3 on a ten-point scale holds all

ten portfolios in a cabinet at time $t - 1$, whereas two parties, one located at 3 and one located at 5, each hold five portfolios at time t , then ideological portfolio volatility takes the value 1 at time t (((5 portfolios * 0 ideological change) + (5 portfolios * 2 points of ideological change)) / 10 portfolios present in both governments).³

Each of the aggregate measures also can be adapted at the portfolio-specific level. *Party volatility of the prime minister*, for example, would measure the number of times that the office of prime minister changes party in a given year. *Individual volatility of the prime minister* would measure the number of times that the individual controlling the prime minister's office changes in a given year.

Table 1 provides the correlations of the five aggregate variables described above, as well as a variable called *General Cabinet Instability* (which measures the total number of terminations in a country-year in the Woldendorp, Keman, and Budge [1993] data; see the Appendix for details about the data). As one would expect, the various definitions of portfolio volatility and cabinet instability are clearly related, with all of the correlations except one in the expected direction, and most being fairly strong. Within-party reshuffles is the only variable that is quite weakly related to the others. This weak relationship is due to the fact that a large number of reshuffles occur in single-party governments during years when no other types of instability or volatility are occurring. Most of the total portfolio volatility therefore, is, related to party changes rather than to individual reshuffles. Finally, one should note that since the correlations are far from perfect, these variables are clearly measuring different things.

CABINET INSTABILITY, PORTFOLIO VOLATILITY, AND HEALTH CARE COST CONTAINMENT

The theoretical arguments suggest that two specific types of instability should affect the ability of govern-

³ I measure the location of parties using data from Castles and Mair (1984), Huber and Inglehart (1995), and Morgan (1976). When data for a party are available from more than one source, I use the data source that is closest in time to the cabinet being coded.

ments to achieve their goals. The next step is to test these arguments empirically. There are, however, two general problems associated with using instability as an independent variable to explain government effectiveness. First, measuring a government's success at achieving its goals requires information about problems requiring government attention, policymaker preferences, and policy outcomes, all of which can be very difficult to obtain. Second, it is tricky to sort out the direction of causation: To operationalize any kind of instability as an exogenous variable affecting performance may be wrong-headed if in fact poor performance is the variable that explains instability.

The empirical test used here addresses these problems. The test involves estimating the effect of portfolio volatility and cabinet instability on health expenditures (as a percentage of GDP) in 18 advanced parliamentary democracies from 1975 to 1989. The general argument behind this test is that in the countries and time periods analyzed, all cabinets, regardless of their ideological dispositions, face strong incentives to contain health care costs. Cost containment requires cabinets to be proactive collectively, and it requires a variety of individual cabinet ministers to deal effectively with civil servants to solve informational problems inherent to health policymaking and implementation. Cabinet instability and portfolio volatility should make cost containment more difficult. Thus, controlling for the other factors that affect health expenditures, increases in cabinet instability and portfolio volatility should be associated with increases in health expenditures.

Health care cost containment is obviously a policy issue with its own idiosyncrasies. It is therefore important to discuss these and to acknowledge that the empirical analysis here, like that on any policy issue, should not be viewed as decisive in evaluating the partisan cabinet instability or portfolio volatility arguments. I will return to this issue in the conclusion. The remainder of this section concentrates on justifying the test, and on making transparent health care's idiosyncrasies.

The hypothesis about instability and health care cost containment follows from several observations about health care provision in the countries analyzed. First, to facilitate inferences about preferences, the data contain only countries and time periods in which health care is not a controversial public policy issue (because the principle of universal access to high-quality health care is universally accepted, see OECD 1992, 1994; Raffel 1985).⁴ Second, governments in these countries play the central role in the finance, delivery, and

regulation of medical care (see, for example, OECD 1987, 1992, 1994; Raffel 1985). Third, although health care is extremely important for all governments (on average, 7.3% of GDP goes toward health care in the countries and time periods used in the analysis), cabinets rarely fall on issues of health policy. In fact, in the data used, governments fell in only one country, Ireland, because of disputes about health care. And in each of the Irish cases, the government had already been teetering on the edge of defeat, with health care playing only a part in the government's ultimate fall.⁵ Thus, it is quite reasonable to assume that if there is a relationship between health spending and portfolio volatility or cabinet stability, it is because volatility or stability affects health spending, and not the other way around.

Finally, it is possible to make inferences about the preferences of government decision makers because all governments have strong incentives to contain health care costs in these countries and time periods. In making this argument, I am not suggesting that all governments want to spend the same amount—some certainly want to spend more than others. Instead, I am arguing that in all these countries, regardless of the level of health expenditures that any particular government desires, all governments face strong incentives to perform some sort of rationing or cost containment (see OECD 1987, 1992, 1994).

This fact is well recognized by health care scholars. Part of the problem is moral hazard on the part of consumers and providers (e.g., Feldstein 1973; Mooney and Ryan 1993; Pauly 1968, 1986; and Reinhardt 1993). Since patients almost invariably receive access to health care under some type of insurance scheme, they never face the full marginal cost of the care they consume (and in most countries with universal coverage, they face virtually no cost at all). Given that medical care is basically "free" at the point of service, patients have incentives to use services which they would decline if they had to pay the full cost (Manning et al. 1987). The value of these extra services to individuals consequently falls short of the social cost of producing them, even when the costs are limited by such cost-sharing mechanisms as co-insurance. Similarly, physicians and other providers have private information about a patient's condition and about the most appropriate treatment. Since neither patients nor payers are in a strong position to challenge a provider's professional judgment about the necessity of a pre-

⁴ The countries are Australia (7.6; 3.9), Austria (8.0; 14.7), Belgium (7.1; 28.7), Canada (8.0; 24.4), Denmark (6.5; .2), Finland (6.9; 14.9), France (7.9; 24.8), Germany (8.4; 2.1), Iceland (7.0; 37.9), Ireland (8.1; -14.8), Italy (6.7; 25.7), Japan (6.4; 20.0), Luxembourg (6.7; 21.8), the Netherlands (8.0; 6.6), New Zealand (6.8; 6.2), Norway (7.0; 11.1), Sweden (9.0; 8.2), and the United Kingdom (5.8; 10.5). The first number in the parentheses is the average spending on health (as a percentage of GDP) for the period 1975–89. The second number is the percentage change in health spending when spending in 1989 is compared with spending in 1975.

⁵ In 1982, following the death of one Fianna Fail MP and the illness of another, the Fianna Fail minority government fell by two votes when three members of the Workers Party refused to support the government's economic plan, which included cuts to health services. In 1987, four members of the minority Labour government resigned to protest the fact that the poorest members of society would have to bear the brunt of the government's health and social welfare cuts. But these resignations were, in fact, part of a broader dispute within the Labour Party about government participation. And in 1989, the sixth in a string of defeats for the minority Labour government concerned the perceived overcompensation of hemophiliacs who had contracted AIDS. The paralyzed government resigned and called for new elections. In the empirical tests presented below, I run the analysis with and without Ireland.

scribed treatment, if providers are paid for the specific services they provide, they will have financial incentives to prescribe unnecessary services. Even in the absence of financial incentives, providers may feel a professional responsibility to pursue all possible avenues of treatment, regardless of their cost-effectiveness.⁶ Since it is impossible for the payers of health care (e.g., insurance companies, sickness funds, or government officials) to obtain the specific information necessary for eliminating unnecessary care, some expenditures on such care is inevitable.⁷

The adverse supply-and-demand incentives inherent to health care provision create the potential for excess spending. But this potential has existed ever since health care has been provided by third-party payers, and during much of this history, health care costs have not been viewed as a large burden on government budgets. This began to change in the early 1970s, and the reason most widely cited by health policy researchers is the rapid technological change that has occurred in the last 25 years. More often than not, technological innovations make it possible either to treat previously untreatable health problems or to lower the personal costs to individuals of treating problems that previously were very difficult to treat (e.g., Newhouse 1992, 1993; Rettig 1994; Schwartz 1987; Weisbrod 1991).⁸ In either case, technological innovation creates new opportunities for "excess" supply and demand. Given the important role that technological innovation plays in shaping health care costs, the data used in the test are for the period 1975–89. Many countries had universal coverage before this, but health care costs were not (relatively) large or rapidly increasing prior to the mid-1970s, providing little reason to expect a relationship between the various instability variables and health expenditures during earlier periods.⁹

Portfolio volatility and cabinet stability should be related to cost containment success for several reasons. First, bureaucrats should have little natural incentive to contain costs. Members of the civil service are likely to be sympathetic to the groups affected by the programs they administer, making it difficult to make hard decisions like cutting benefits, closing hospitals, or otherwise limiting access to care. Bureaucrats may also be natural budget maximizers, or they may simply be resistant to change. Cabinet ministers must therefore be able to control effectively the numerous agencies involved in health care finance and delivery and to

supervise the implementation of specific reforms passed by parliaments. Second, cabinet instability and portfolio volatility can limit cost-containment success through their effect on the ability of the central government to adopt effective cost-saving legislation. In order to contain health care costs, countries must be proactive, and the OECD has chronicled many of the efforts that have been made since the mid-1970s. These include changes in the systems of finance, in how providers are paid, and in how cost overruns are addressed. Governments also have made hard decisions about rationing care by requiring general practitioners to act as gatekeepers, by limiting the availability of capital equipment, and by placing limits on the types of procedures that are covered. In some countries, proactive legislative efforts assume rather extraordinary detail, with legislation specifying which hospitals (or hospital beds) must close, which pharmaceuticals will be covered by social insurance, or the price paid to providers for individual services (or a given pharmaceutical).

The great variety of cost-containment strategies available to politicians is important for justifying the use of health spending to test the portfolio volatility arguments. One may be tempted to claim that informational arguments are irrelevant to the health care spending issue if indeed all parties share the same cost-containment objective. But such an argument would be wrong. On the one hand, competing parties may have few incentives to help each other regardless of their preferences (making it more difficult for cabinets to control civil servants if civil servants do not have cost-containment objectives). On the other hand, parties will likely have quite different views on how to contain costs (with some, for example, preferring to focus on providers, others on payers, and still others on consumers). An illustrative example comes from the Netherlands. In 1986, the Center-Right government formed the Dekker Committee on health care reform, which made a report that led to major structural changes in 1988. But when a Center-Left government came to power in 1989, it stopped implementation of the reforms for six months, not because the Left government opposed cost containment, but because it wished to conduct its own review of how to do it. The new government ultimately decided to continue implementing the main cost-containment initiatives proposed by the Dekker Committee, but it also decided to slow the pace of reform, and to modify changes proposed by the Dekker Committee on a variety of policy issues, including the content of the basic insurance package, compulsory payment of premiums, and the regulation of competition (see OECD 1992, chapter 7).

In sum, since the early 1970s, all governments have faced severe cost-containment problems in the area of health care. Addressing these problems requires the oversight of bureaucrats, as well as the proposal and adoption of new legislation. Cabinet instability and portfolio volatility should negatively affect a government's ability to monitor bureaucrats, obtain information for reform, and act collectively to make changes in the health care system. Thus, when controlling for

⁶ On physician-induced demand, see Evans 1974; Hay and Leahy 1982; and Rice and Labelle 1989.

⁷ In the United States, the rapid movement toward managed care in the 1990s has been a (partial) response to precisely this problem. In other countries, analogous direct control by payers over providers is rare in medical decision making and was virtually nonexistent during the period I analyze in this article.

⁸ It is clearly not the case that all technologies increase the costs of medical care, with the polio vaccine being an excellent and frequently cited example of a technology that reduces costs. But there are numerous examples of technologies—"non-invasive imaging, invasive cardiology, transplantation, monoclonal antibodies, and renal dialysis" (Newhouse 1993, 162)—that increase costs.

⁹ The ending date of my data set is 1989 because that is the last year for which I have portfolio data.

other factors influencing health care expenditures, increases in portfolio volatility or cabinet instability should be associated with increases in health spending.

THE EMPIRICAL MODEL

The goal of the statistical tests is to estimate the effect of the various cabinet instability variables on health care cost control. To estimate this effect, it is crucial to control for the other factors that affect health care spending. When such controls are included, the coefficients and standard errors for the cabinet instability variables provide the relevant information about the cost of instability to government effectiveness at containing costs.

The statistical models include eight control variables taken from the literature on health care spending.¹⁰ *Population > 65* measures the percentage of all individuals who are 65 years of age or older. Since the elderly suffer frequent, chronic, and serious health problems, they are expensive to treat. We should therefore expect this variable to have a positive effect on expenditures. *Medical CPI* measures the medical price index. Numerous individuals point out that technological advance has led medical-specific inflation to outpace overall inflation since the early 1970s. This variable should therefore have a positive coefficient. *Doctors per Capita* is the number of doctors per 1,000 citizens. Given the monetary and nonmonetary incentives that physicians have to oversupply medical care, this variable should have a positive coefficient. *Fee for Service* is a dummy variable that takes the value 1 if physicians are paid according to the number of services they provide and 0 otherwise (when physicians are paid by capitation or salary). The variable should have a positive coefficient because fee-based payment systems encourage oversupply of care by doctors. *Global Budgets* is a dummy variable that takes the value 1 if hospitals are paid by global budgets and 0 otherwise. Scholars have argued that capping spending should be an effective way of curtailing spending in hospitals on unnecessary care. This variable should therefore have a negative coefficient. *Public Finance* is the percentage of total health expenditures that are public expenditures. Scholars argue that this is an important variable, but they differ on its expected effect. Some argue that centralization of finance in the hands of one (or a small number of payers) creates greater opportunities to shape individual incentives to limit demand (such as co-insurance) (see Cuyler 1989; see also Gerdtham et al. 1992). Viewed this way, the public finance variable should have a negative coefficient. Leu (1986), on the other hand, argues that the coefficient should be positive because he believes the concentration of decision-making power in the hands of government bureaucrats leads to inefficiencies. Finally, *Log(GDP/capita)* is the

log of GDP per capita. This variable has been widely found to be linked to health expenditure levels, with richer countries spending more on health care.

A final control variable, which I omit from the results reported here (see below), measures the Left-Right ideology of parties in government. Justification for including this variable would be a belief that Left governments should want to spend more on health care than Right governments (as is often posited, for example, in studies of the welfare state; see Hicks and Swank 1992 or Pampel and Williamson 1989). It is important to note, however, that the Left governments argument is difficult to defend in the health expenditures context. As noted above, the data are carefully chosen to include only countries and time periods in which the battle over universal coverage had already been won, with the principal of universal coverage widely accepted by all parties and seemingly irrevocable. In addition, the direction of a Left-Right argument is unclear in an environment of cost containment—money spent on health care often goes to groups that are likely to support the Right, such as pharmaceutical companies, physicians, or religious hospitals.

In empirical tests, when variables measuring the Left-Right position of the government are included in the analysis, none has an effect that is remotely close to statistically significant. Moreover, including government location variables never affects the results for the other variables in the analysis. Given the shaky theoretical foundation for the government ideology argument and the lack of empirical support for including it, I omit the government ideology variables from the analysis below.¹¹

To estimate models that use time series data with cross sections, ordinary least squares (OLS) is inappropriate because such data have error processes that violate standard OLS assumptions. In particular, models for such data should allow for temporally correlated errors (errors in country j at time t are correlated with errors in country j at time $t - 1$), spatially correlated errors (errors in country j at time t are correlated with errors in country k at time t), and panel heteroskedasticity (error processes differ across countries, for example, because of the size of the countries). I therefore use an error correction model to estimate the relationship between the instability variables and health expenditures. Error-correction models are perhaps best known for use in situations where the dependent variable is nonstationary and cointegration is present (i.e., two or more variables are in an equilibrium relationship and thus tend to vary in the same way). In my data, the dependent variable is stationary, so I am not using error-correction to address cointe-

¹⁰ See, for example, Chu 1992; Gerdtham, Sogaard, Andersson, and Jönsson 1992; Glaser 1991; Hitiris and Posnett 1992; Jellinek 1982; Mendelson and Schwartz 1993; Newhouse 1977; Pampel and Williamson 1989; Parkin, McGuire, and Yule 1987; and Wolfe and Moran 1993.

¹¹ I obtain measures of the Left-Right locations of parties using data from Castles and Mair 1984; Huber and Inglehart (1996); and Morgan 1976. When more than one data source is available for a party, I use the data most proximate to the country-year being measured. I weight the Left-Right position of each party in government by the number of seats that it controls in parliament, and for each country-year, I weight each government by how many days it was in power. Government location variables were estimated using the current year, as well as averages for the past 2, 3, and 4 years.

gration but rather because it has nice properties for investigating the theoretical questions posed above.¹²

The error-correction model is given by

$$\Delta y_{i,t} = \alpha + \Delta x_{i,t}\beta + \phi(y_{i,t-1} - x_{i,t-1}\gamma) + \varepsilon_{i,t}, \quad (1)$$

where $y_{i,t}$ is health expenditures in country i during year t , and x is a vector of independent variables. The dependent variable, then, is the change in health expenditures, and the independent variables include the lagged level of health expenditures, the lagged values of each independent variable, and changes in the independent variables. The model is based on the idea that the dependent and independent variables are in a long-run equilibrium relationship,¹³ and also that there exist short-run (temporary) effects of the independent variables on the dependent variable. To see this, note that the model one actually estimates is

$$\Delta y_{i,t} = \alpha + y_{i,t-1}\beta_0 + \Delta x_{i,t}\beta_k + x_{i,t-1}\beta_j + \varepsilon_{i,t}. \quad (2)$$

The short-run effects are given by β_k , which provides estimates of the effect of changes in the independent variables on changes in health expenditures. The long-run effects measure the long-run equilibrium relationship between the independent variables and the levels of health expenditures.¹⁵ The model therefore will allow us to explore whether the theoretical arguments about instability and volatility are about long-run equilibrium relationships and/or short-run impediments to government performance.

I estimate the model using OLS, which produces consistent parameter estimates under standard assumptions. The lagged dependent variable addresses the problem of serial correlation. I report panel-corrected standard errors to address problems of panel heteroskedasticity and contemporaneous correlation of errors across countries (Beck and Katz 1995).¹⁶

The political instability variables are measured based on average levels of instability or aggregate volatility in the three years prior to the current year of health spending.¹⁷ The tests of the portfolio volatility argu-

ments focus on aggregate variables because health expenditures turns out to be a very difficult issue on which to test portfolio-specific arguments. One problem with a portfolio-specific approach is that ministers other than the minister of health make important decisions that affect health expenditures. Two very important actors are the finance minister and prime minister, but the social security minister, labor minister, education minister, trade minister, minister for intergovernmental affairs, and even environmental minister (who makes decisions about the disposal of the radioactive waste produced by hospitals) also play an important role in health policymaking. A second problem is that across countries, health ministers do quite different things. Sometimes they have large responsibilities for making decisions that affect spending, while in other countries their role is much more limited.¹⁸ Thus, testing the effect of health ministry volatility on health spending would be inappropriate, and in this analysis I focus exclusively on aggregate portfolio measures.

EMPIRICAL RESULTS

Table 2 presents the results.¹⁹ The first five columns include the control variables and one of the instability variables. The first five rows give the estimates for the long-run (permanent) effects of the instability variables on health expenditures (β_j in equation 2). The next five rows (6–10) give the estimates for the short-run (temporary) effects. The controls are given at the bottom of the table, as is the lagged health expenditures variable.²⁰

First consider the long-run effects of instability (the level variables). Since rows 1–5 indicate that none of the political variables is even close to statistically significant, these regressions reveal the absence of any long-run equilibrium relationship between the level of

year addresses the endogeneity problem—it would be very difficult to argue, for example, that health spending in 1985 caused cabinet instability in 1984 (especially controlling for health spending in 1984, as done here). Averages address the problem that the January 1 cutoff points result in arbitrary categorizations of volatility and instability that occur near the beginning or end of a calendar year. The three-year averages provide a reasonable way to capture the time it takes for decisions to affect outcomes, to maintain proximity to the actual spending, and to smooth volatility across the (arbitrary) calendar years.

¹⁸ Countries vary considerably, for example, on whether health ministers are responsible for hospitals, insurance companies, the overall performance of the health care system, finance, budgets across different aspects of health care, public health, physicians, reimbursements, medical education, pharmaceuticals, and so forth. As noted above, often these various tasks are shared across a range of ministers.

¹⁹ In addition to the results presented here, I also estimated the model with the general cabinet instability variable described in Table 1. The coefficients for the change and level versions of this variable were not statistically significant, which is not surprising given the atheoretical nature of the general instability variable. As noted above, even had the variable been statistically significant, it would be difficult to know how to interpret the effects, since the variable captures such a diversity of events.

²⁰ All results were generated using the *xtgls* command (with the *pcse* option) in Stata 5.0.

¹² A Dickey-Fuller test strongly rejects the possibility that a unit root exists. My discussion of the error correction model draws heavily on Beck 1991 and Beck and Katz 1996.

¹³ The "error correction mechanism" (the term in parentheses in equation 1) measures how far out of equilibrium this relationship becomes following short-run changes, and the coefficient ϕ measures the speed with which the relationship returns to equilibrium.

¹⁴ Equations 1 and 2 are the same: β_0 in equation 2 is ϕ in equation 1, β_j is $\phi\gamma$, and β_k is β .

¹⁵ These long-run effects are given by $-\beta_j/\beta_0$. Note that we can rewrite equation 2 as an ordinary lagged dependent variable model, $y_{i,t} = (1 + \beta_0)y_{i,t-1} + \Delta x_{i,t}\beta_k + x_{i,t-1}\beta_j + \varepsilon_{i,t}$. The calculation of long-term effects is therefore the same in this context as the calculation of long-term effects in standard lagged dependent variable models. See, for example, Green 1997, chapter 13.

¹⁶ Beck and Katz (1996) conduct a variety of Monte Carlo simulations which support the use of the lagged dependent variable with panel-corrected standard errors in this context. For each estimation presented, I conducted the Lagrange multiplier test described in Beck and Katz 1996. All these tests indicate the presence of no serial correlation in the models that include the lagged level of health expenditures.

¹⁷ A lag is used because it takes time for government decisions to affect actual spending outcomes. In addition, excluding the current

TABLE 2. Effects of Portfolio Volatility and Partisan Cabinet Instability on Health Expenditures

Dependent Variable: Change in Health Expenditures/GDP	(1)	(2)	(3)	(4)	(5)	(6)

Note: OLS is used to estimate the parameters, and panel-corrected standard errors are given in parentheses. $N = 270$ (15 years and 18 countries). * $p < .05$, ** $p < .01$, *** $p < .001$.

cabinet instability or portfolio volatility and the level of health expenditures. Put differently, all else equal, countries with higher levels of portfolio volatility or cabinet instability do not control health expenditures less effectively than do countries with lower levels. These results, then, do not support the theoretical arguments, applied at the level of the national political system.

The results for the short-run effects of cabinet insta-

bility (the change variables, which are denoted by the symbol Δ) are given in rows 6–10. All of the coefficients except within-party reshuffles have the expected positive sign. And two of the variables, Δ Total Portfolio Volatility and Δ Party Portfolio Volatility are precisely estimated (with the p -value for the coefficients on party volatility being less than .01). The short-run effects for within-party reshuffles and ideological portfolio volatility are measured imprecisely and do not support the

theoretical arguments. Given these results, it seems clear that the component of total volatility that is most important for explaining health expenditures is changes in the partisan control of portfolios. The coefficient for partisan cabinet instability is more precisely estimated than those for within-party reshuffles or ideological portfolio volatility, but this coefficient is not statistically significant at conventional levels ($p = .12$).

Before discussing these results in greater detail, it is useful to test the two theoretical arguments in the same statistical model. The results are given in column 6 of Table 2, where the model includes within-party reshuffles, party portfolio volatility, and partisan cabinet instability (as well as the other control variables). These results, of course, should be interpreted with some caution because of the high correlation between party portfolio volatility and partisan cabinet instability. Nevertheless, it is important to note that the result for the short-run effect of party portfolio volatility is consistent with that found in column 3. The coefficients for both the short-run and long-run cabinet instability variables continue to be measured with considerable error, as do the coefficients for within-party changes in portfolio control. The results from column 6, then, provide support for the informational argument applied to party volatility, but they fail to support the application of informational arguments to reshuffles of portfolios within political parties. The analysis also fails to support the argument about the partisan composition of the cabinet.

The relationship between changes in party portfolio volatility and health expenditures seems very robust. The results, for example, are not sensitive to the precise specification of the control variables. As noted above, none of the results is affected by the inclusion of a variable measuring the Left-Right ideology of the government (which is of doubtful theoretical relevance). And although Table 2 includes the control variables that I feel are most prominent in the health spending literature (see cites in footnote 10), the inclusion of each of these variables is not uncontroversial. Newhouse (1992), for example, argues that medical CPI is a noisy variable, and the long-term effect of this variable has the wrong sign in Table 2. And Glaser (1987) argues that global budgets may not always contain costs. I therefore estimated models without each of these variables. In addition, it is not clear what the functional form for the GDP variable should be; so I also estimated the model using GDP/capita, rather than the log of this variable. Finally, although the theoretical argument for doctors per capita is well developed, this variable is not statistically significant in Table 2. I therefore estimated the model without it. Notably, none of these permutations in the specification of the control variables affects the substantive findings regarding party portfolio volatility.

In addition, the findings are not sensitive to the inclusion of particular countries. One can remove any country from the model in column 3 or column 6 and the coefficient for the party portfolio volatility variable remains precisely estimated and stable in magnitude.

Similar "robustness" tests also show some fragile support for the arguments about partisan cabinet instability. In particular, when any of five countries is removed from the data (Austria [.09], Finland [.06], Ireland [.09], Italy [.09], or Japan [.07]), the coefficient for the short-run cabinet composition variable is statistically significant in the expected direction and is measured reasonably accurately (with p -values ranging from .06 to .09).²¹

Party portfolio volatility has a robust short-run effect on health expenditures, but is the magnitude of this effect substantial? In error-correction models, the magnitude of a short-run effect depends on the size of the effect *and* on how long it persists. How long an effect persists depends on the relationship between the dependent variable and its lag (because, for example, if a change in variable x leads to a change in expenditures at time t , this effect will continue into time $t + 1$ if expenditures at time t affect expenditures at time $t + 1$). In general, if β_0 is equal to the coefficient on the lagged dependent variable, then to find out how many time units, t , it takes for the short-run effect to reach p % of its original value, one must calculate $(1 + \beta_0)^t = p$. The effect after t years is therefore $t = \ln p / \ln (1 + \beta_0)$.

If we use the coefficients in column 6, then a one standard deviation increase in Δ party portfolio volatility (10.7 portfolios) in year t would be associated with an increase in health spending of $\frac{2}{10}$ of 1% of GDP in year $t + 1$. The results for the lag of the health expenditures variable (see the bottom of Table 2) indicate a strong effect of health spending at time $t - 1$ on health spending at time t . The effect of this change would therefore disappear quite slowly, remaining at $\frac{1}{10}$ of 1% of GDP 5.3 years later.

Figure 1 shows another way to view the magnitude of the effect of the change variable for party portfolio volatility. The figure provides an answer to the following hypothetical question: If France reduced its level of party portfolio volatility to the level found in Germany and sustained this reduction, how much money would France save on health expenditures? In my data, France's average level of party portfolio volatility is approximately 14 per year, and Germany's is approximately 3 per year, so France would have to reduce its portfolio changes across parties by about 11 per year to achieve Germany's level of party portfolio volatility (just over 1 standard deviation in the data set). Using the .016 coefficient for Δ party portfolio volatility (from column 6 of Table 2), the reduction by 11 in party portfolio volatility would decrease spending by .176% of GDP. France's GDP was 1.173 trillion dollars in 1995. Thus, this one-time decrease in the level of party portfolio volatility would save France just over two billion dollars in the first year. But as noted above, since there is a strong effect of health spending at time $t - 1$ on health spending at time t , the savings in the

²¹ In addition, when the medical CPI variable is excluded, the short-run effect of party cabinet instability is statistically significant, ($p = .04$), although this effect disappears when any of three countries is omitted from the data set.

FIGURE 1. Potential Health Care Savings in France Following a Reduction in Party Portfolio Volatility to the Level in Germany

Note: Figure assumes that (1) there is a (one-time) reduction in portfolio volatility of 11 portfolios (see text), (2) the effect of party portfolio volatility is equivalent to that given in column 6 of Table 2, and (3) the GDP in France of 1.173 trillion dollars.

first year would have a ripple effect beyond the first year. As Figure 1 shows, assuming no further change in party portfolio volatility, the effect of this one-time reduction would still be about one billion dollars in savings eight years later, and would be about 225 million twenty years later. The coefficient for this variable, then, is substantively large, and although the effect is temporary, it disappears quite slowly.

CONCLUSION

The empirical tests produce two significant findings. The first is the absence of a long-run equilibrium relationship between any of the instability or volatility variables and health expenditures. Although this finding obviously concerns only one policy area, it underlines the need for careful thought about whether the average level of government instability in a country affects political performance there. Indeed, although scholars frequently talk of instability as if it is a problem that plagues particular countries or regimes, specialists of the most unstable systems (Italy and Fourth Republic France) have often questioned the extent to which instability actually creates policymaking problems (e.g., Dogan 1989; Sartori 1994; Siegfried 1956). Consistent with the doubts raised by these specialists, the results presented here indicate that on average, countries with higher levels of partisan instability in governing coalitions or partisan portfolio volatility find ways to solve problems that instability and volatility can create.

But the second empirical finding suggests that although the theoretical arguments do not explain differences in performance at the system level, they do explain problems that instability can create in the short

run. In particular, the analysis provides robust support for the informational argument that an increase in the number of portfolio changes across parties limits government effectiveness. Empirical support is much weaker, however, for the argument about the effect of changes in the party composition of the governing coalition on political performance. The analysis therefore underlines the importance, in operationalizing definitions of governmental stability, of measuring not simply the occurrence of particular events (i.e., government terminations) or the changes that occur in government composition, but also of measuring the distribution of power across parties within governing coalitions over time.

Together, these two findings suggest several items for future research. First, the presence of short-run effects and the absence of long-run effects for party portfolio volatility points to the need for further analysis of how institutional arrangements shape relations between bureaucrats and cabinet ministers. Scholars have offered interesting arguments that particular institutional arrangements can help elected politicians overcome the informational advantages often enjoyed by bureaucrats (e.g., Bawn 1995; Kiewiet and McCubbins 1991; Ramseyer and Rosenbluth 1993). But this research does not explore how (exogenously caused) changes in the policy objectives of elected officials (i.e., by changes in party control of portfolios) affects the ability of these officials to create appropriate incentives in bureaucracies. As noted above, if portfolio volatility is a regular feature of political life, and if portfolio volatility poses informational costs to ministers in their relationships with civil servants, then we should expect ministers in such systems to adopt organizational structures that limit these costs.

The analysis presented here has not focused on what such structures might look like, although certain possibilities suggest themselves. For example, if volatility diminishes the ability of cabinet ministers to rely on information from civil servants, then we may expect ministers to look to other sources for information, at least during policy formulation. These sources may include interest groups (though previous comparative studies suggest that volatility encourages interest groups to create alliances with bureaucrats), special task forces that are created to study specific problems, extensive ministerial cabinets (personal staffs of ministers who are policy experts), or extensive party-funded research staffs. Similarly, politicians in volatile systems may create more fluid rules for hiring and promoting senior civil servants, so that new ministers can quickly shape the personnel in the relevant agencies. They also may grant less autonomy to senior civil servants in establishing annual agency budgets.

Second, the finding of a short-run effect of portfolio volatility on political performance suggests the need for additional research on the distribution of ministerial portfolios. As noted above, Laver and Shepsle (1990, 1996; see also Austen-Smith and Banks 1990) have made headway on this question, but the analysis presented here suggests the presence of an important informational problem that their approach neglects. In

particular, the assumption in existing models that cabinet ministers can costlessly implement their most preferred policies should be adjusted to accommodate more explicitly both the *distributive* and the *informational* cost and benefits associated with changes in the distributions of portfolios. Such an approach may yield new insights into why in some countries political parties often seem to "own" particular portfolios (see, e.g., Budge and Keman 1990).

Third, additional research needs to focus on in-depth analyses of the precise ways in which portfolio volatility affects policymaking. Drawing on previous studies of cabinet government in unstable systems, and on existing game theoretic models, I have argued that portfolio volatility affects political performance through its effect on information transmission. Consistent with the theoretical argument, the empirical analysis provides direct evidence that portfolio volatility is a problem for governments. Although I am unaware of other theoretical arguments that may lead to the same operationalization of the portfolio volatility variable, I also recognize that the empirical analysis provides only indirect evidence of informational problems across ministers, civil servants, and interest groups. Of course, the same will be true of any analysis that uses instability variables as proxies to explore the effects of particular types of political decision-making problems on political performance. Future research should therefore explore more directly the ways in which cabinet ministers address the types of informational problems (or cabinet decision-making problems) discussed in this article.

Finally, the book should hardly be closed on further analysis of how changes in the party composition of the governing coalition affect political behavior. On one hand, there is weak empirical evidence supporting the argument. On the other hand, the empirical tests used here may have stacked the deck in favor of informational arguments. As noted, health care raises a great deal of informational difficulties for policymaking, and many health expenditure decisions are the result of interactions between civil servants and ministers. In this respect, it is not surprising that the results are stronger for the portfolio variables than for the cabinet stability variables. On other issues, especially ones where informational asymmetries are less important, or where policy differences across political parties are more stark, it is more likely that frequent or unexpected changes in the partisan composition of the cabinet will create difficulties for party leaders.

This observation further underscores the importance of developing careful theoretical arguments about the types of instability that are important in specific decision-making contexts. Without such arguments, it is impossible to know how to operationalize instability as an explanatory variable, and it is also impossible to know how to interpret the significance of research focusing on the sources of instability itself. With such theoretical arguments, it is possible to investigate a wide range of issues that are central to achieving a better understanding of political decision-making in parliamentary democracies.

APPENDIX: Summary Statistics of Variables

Variable	Source	Mean	SD
Health Spending	OECD 1993	7.2	1.0
Population >65	OECD 1993, Table A1.1.5	12.7	2.3
Doctors per Capita	OECD 1993, Table 5.1.1 and Table A1.1.1	1.9	0.5
Public Finance	OECD 1993, Table 4.1.2 and Table 4.1.1	81.0	8.5
Global Budgets	Gerdtham et al. 1992, OECD 1992, 1994, and Wolfe 1993		
Fee for Service	Gerdtham et al. 1992		
Medical CPI	OECD 1993, Table 4.4.1	79.2	32.3
Log(GDP/capita)	OECD 1993 software package using purchasing power parity dollars	2.2	0.4
Total Portfolio Volatility	Woldendorp et al. 1993 and <i>Keesing's Record of World Events</i> ^a	11.3	12.5
Party Portfolio Volatility	Same as Total Portfolio Volatility	6.9	10.6
Within-Party Reshuffles	Same as Total Portfolio Volatility	4.6	5.7
Ideological Portfolio Volatility	Same as Total Portfolio Volatility ^b	.6	1.1
Partisan Cabinet Instability	Same as Total Portfolio Volatility	.3	.6

^aWoldendorp et al. (1993) was used to identify changes that occurred across successive governments. *Keesing's Contemporary Archives* was used to identify each portfolio change that occurred between the formation of successive governments.

^bIn addition, three expert surveys were used to place each government party on a 10-point Left-Right scale (Castles and Mair 1984, Huber and Inglehart 1995, and Morgan 1976). (Data from Castles and Mair and Morgan were converted to the 10-point scale.) Where multiple data sources existed for particular parties, the expert survey most proximate to the time period of analysis was used.

Comparative Dynamics of Parliamentary Governments

DAVID P. BARON *Stanford University*

This article presents a dynamic theory of parliamentary governments that incorporates attributes of the institutional system in a country, exogenous events that shape parliamentary and electoral opportunities, and the strategies of the government and the opposition as structured by institutions and preferences. The dynamics are investigated in an infinitely repeated game in which events in the form of shocks to income or government resources occur and the government responds with a legislative proposal that is subject to a confidence or censure procedure and may lead to government continuation, reorganization, or dissolution. With a majority confidence procedure, governments are stable, and if parties are politically patient, voting cohesion within the government is high. A censure motion initiated by the opposition can result in voluntary dissolution of government, and the approach of required elections increases the likelihood of dissolution. If the events represent fluctuations in aggregate income, government dissolution occurs in good times for the government leader and bad times for the other parties.

Formal theories of parliamentary governments typically focus on the formation and duration of governments. This focus reflects the fundamental characteristic of such systems that the government is installed by and continues under the confidence of the parliament. Under this confidence relationship the government exercises effective control of the agenda-setting process in the legislature, and the legislation enacted by the parliament then follows from the program of the government. Changing circumstances and exogenous events, however, can disrupt this relationship and result in government termination, which requires either the formation of a new government or an unscheduled election. This article presents a dynamic theory of parliamentary government with an emphasis on government formation, legislation, and termination under alternative institutional confidence relationships.

The empirical literature has taken three basic approaches to the study of the duration and termination of parliamentary governments (Browne, Frendreis, and Gleiber 1988; Strom 1988). One is based on attributes of the country and its political system, including voter preferences and societal cleavages, party polarization and fragmentation, and electoral and parliamentary institutions (Dodd 1976; Taylor and Herman 1971; Warwick 1979, 1992). A second approach focuses on critical events, such as economic and political crises, that can lead to government termination, and it often involves estimation of a hazard rate (Browne, Frendreis, and Gleiber 1984, 1986; Merlo 1997). These two streams have been combined by King, Alt, Burns, and Laver (1990), who consider a model that includes both a hazard rate and attributes.

The third approach focuses on the strategies governments and their opposition adopt in response to events that affect preferences and opportunities. These strategies determine whether, for example, a government reorganizes or terminates, and hence they identify which events are critical. Strom (1990) and Grofman and Van Roozendaal (1994) take this perspective in empirical studies, and Lupia and Strom (1995) and Diermeier and Feddersen (1996) present theories of government termination based on this approach. The strategic perspective identifies the importance of parliamentary activity in government termination and requires that legislation be taken into account. This paper was motivated by the work of Lupia and Strom and Diermeier and Feddersen.

The model presented here includes the principal features of these three approaches: attributes of the institutional system in a country, exogenous events that represent changing circumstances and shape parliamentary and electoral opportunities, and the strategies of the government and the opposition as structured by institutions and preferences. The focus is on the conjunction of legislative activity and parliamentary procedures for terminating a government, and the principal institutional features considered are confidence and censure procedures.¹ The dynamics are investigated in an infinitely repeated game of distributive politics. In each period, an event in the form of a shock to income or government resources occurs, and the government responds with a legislative proposal that is subject to a confidence or censure procedure and may lead to government continuation, reorganization, or dissolution. This provides a comparative theory of parliamentary governments in which the comparison is across procedures for government termination. It also provides an approach to the study of the dynamics of parliamentary governments that can inform empirical studies.

The theory seeks explanations based on the institutional characteristics of the parliament and not on preference-based alignments of interests that can pro-

¹ See Laver and Schofield (1990), chapter 4, for an analysis of the role of these procedures in parliamentary democracies.

vide stability to governments. The model thus is formulated to make government stability difficult to achieve and sustain. The model has five features. First, the interests of parties are diametrically opposed, and hence the stability of a government does not directly follow from preferences. Second, legislative proposals are unrestricted, so the government can seek the support of the opposition on legislation. Third, the parties or members of parliament are unable to commit to actions, such as always voting for the proposals of their coalition partners or against the proposals of the opposition. Fourth, the events are independently distributed, so there is no serial correlation to favor stability. Fifth, the strategies of parties are not conditioned on the past, so there is nothing in the equilibrium that explains government stability or instability in terms of past coalitions. More specifically, strategies are not based on a history that can provide an affinity for a particular government, nor are government formation, legislation, and termination based on punishments for past behavior. Instead, government formation and stability are based on opportunity, and since parties are assumed to be unable to commit to how they will act in the future, they act based on current opportunities and their expectations about future opportunities. Despite these features, governments can be stable. The principal factors contributing to this stability are the control of the agenda-setting process and the opportunity to respond to events through legislation and possibly the direct reorganization of government, if permitted by the confidence procedure (Strom 1990, 110–1).

Parliamentary institutions include a variety of both constitutional and less formal procedures for terminating a government prior to a required election. Huber (1996) reviews government-initiated confidence procedures in eighteen parliamentary democracies, and Laver and Schofield (1990, 62–6) provide data on confidence and dissolution procedures in twenty countries. Using the distinction made by Huber, two procedures are considered. The first is a majority confidence procedure initiated by the prime minister or government under which the government terminates if a legislative proposal it introduces fails to receive a majority vote. Huber (1996) refers to this as a “confidence vote procedure,” and with the exception of how abstentions and absences are counted, it is the procedure in all but one of the eighteen countries identified in his Table 1. The second is a censure or no-confidence procedure under which the government terminates as the result of an opposition proposal to which the procedure is attached.²

A majority confidence procedure is shown to yield government stability, but exogenous events may provide incentives for a government party to seek the support of the out party on legislation when it is opportune to do so. An important parameter of the

model is the political discount factor, which reflects the political impatience of party leaders to obtain benefits for their constituents. This impatience may result from electoral considerations or from the personal preferences of party leaders to be in government. When parties are patient, the political discount factor is high, and the resulting government cohesion is high. When parties are impatient, cohesion is lower. If the events represent fluctuations in aggregate income, then government dissolution can occur in good economic times for the constituents of the government leader and bad economic times for the constituents of the other parties. This corresponds to the opportunistic calling of an early election by the government leader.

A censure procedure can result in voluntary dissolution of the government, and this occurs when events are favorable for the government leader. This is consistent with the perspective that changes of government are caused by events and pressure from the opposition. The approach of required elections increases the likelihood that there will be a voluntary dissolution, since the incentive to maintain control of the agenda-setting process is reduced. The hazard rate thus is increasing, but this is caused not by the time in office but by the time to the next required election. The theory also explains which events are critical for government cohesion and stability and which institutional factors affect the set of critical events.

In addition, the model predicts that the governments formed are minimal winning coalitions, since the party designated the formateur has majoritarian incentives to redistribute income among as few parties as possible (Riker 1962). Moreover, governments always include the smallest of three parties and hence are never formed by the largest parties. Alternative models are considered to identify conditions under which a minority government will form. Surplus majorities do not form.

PARLIAMENTARY GOVERNMENTS

Most parliamentary systems have a set of distinguishing institutional features. First, parliament selects or installs the government—the prime minister and the cabinet—so the executive and a majority in parliament are aligned. Second, the government controls the legislative agenda-setting process, over which the opposition has little direct influence.³ Third, parliamentary systems have confidence and censure procedures that allow the government or the opposition to condition the continuation of the government on the vote on a legislative proposal. These procedures can lead to a reorganization of the government or an unscheduled election. Once a government has formed, however, it presumably will remain in office unless changing circumstances or events provide incentives to restructure

² Majority confidence procedures and censure or no-confidence procedures are both present in most parliamentary systems. The analysis will begin with the first type in isolation, and then both types will be considered together.

³ Huber (1996), for example, models the legislative process as involving proposals only from the majority that supports the government. Silk and Walters (1995, 109) note that in the United Kingdom almost all government bills are passed, and in 1992–93 all were passed.

or terminate it. Yet, the government members can respond by changing their policies to preserve the government, so the events may or may not be critical. Budge and Keman (1990, 160–1) present data for nineteen parliamentary democracies from 1950–83 indicating that 46.4% of the governments were terminated for political reasons, such as dissension within the government, and 12.6% were terminated to hold an early election. Among the minority governments studied by Strom (1990), 72% were terminated as the result of a crisis or a defeat on a confidence vote, censure motion, or legislative policy.

The formal theory of parliamentary governments initially focused on coalition formation implemented by the allocation of benefits, such as portfolios (Riker 1962). Axelrod (1970) extended this perspective to a spatial model and examined whether coalitions are connected or disjoint. Austen-Smith and Banks (1990) and Laver and Shepsle (1990, 1996) examined coalition formation in a model of ministerial delegation in which the policies of government are determined by the allocation of portfolios and the subsequent delegated policy choices of ministers. Another line of research views government formation as a bargaining game in which parties are sequentially extended the opportunity to form a government. Baron (1991, 1993) presents a sequential model of government formation in which policy-oriented parties bargain over policies and coalitions. Austen-Smith and Banks (1988) present a unidimensional model of a parliamentary system with a proportional representation electoral system and a sequential government formation process. None of these frameworks, however, incorporates the possibility of dissolution of the government once formed.

Several recent models have explored the possibility of government dissolution. Lupia and Strom (1995) present a one-period model incorporating attributes, an exogenous event that reflects the election prospects of parties, and strategic responses by the coalition government. Crombez (1996) presents a model in which, as a function of seat shares and policy preferences, surplus and minority governments can form in addition to minimal winning coalitions. Huber (1996) presents a model in which a prime minister can use a confidence procedure to bring members of the majority party back into line. Huber (1997) extends this to incorporate incomplete information about the preferences of pivotal members of the government coalition, and his tests found that the nature of cabinet decision making and the extent of the opposition's influence affect whether government termination results from defeat in parliament or from resignation. Smith (1996) presents a model of a majority government in which voters have incomplete information about the competency of the government. He found that early elections are called when times (e.g., the economy) are good, and more competent governments wait longer than less competent governments before calling an election. In the complete information model considered here, governments are also more likely to terminate in good times than in bad for the government leader (agenda setter), and the more impatient the parties and the

closer a required election, the more likely is the government to terminate. The model follows most closely that of Diermeier and Feddersen (1996), who compare a parliamentary system with a majority confidence procedure to a U.S.-style system, in which once formed the government cannot fall.⁴

THE MODEL

Using the approach introduced by Diermeier and Feddersen, the framework presented here includes periods of two types. The first is a government organization period in which a party is selected to form a government. If one is not formed, then the next period is another organization period. If a government formation proposal receives a majority vote, then the government is installed, and the second type of period commences. In this legislative period, a member of the governing coalition is selected as leader and makes a proposal to redistribute income. That proposal is voted against an exogenous reservation value, and the parties vote taking into account the consequences for the continuation of the government.⁵ Attached to the proposal is a confidence or censure procedure that can result in the termination of the government, followed by an organization period.⁶ An organization period can involve the reorganization of the government or an election, followed by a government formation process.

In every period, the economy is assumed to generate one unit of income or government revenue that may be redistributed by the parliament under majority rule. The interests of parties are assumed to be to redistribute income to their constituents, whether a geographic constituency or, in a proportional representation system, such interests as business, labor, consumers, environmental groups, or agriculture. Redistribution can take place only after a government has been formed in an organization period, which may be interpreted as an election and the formation process that follows. Electoral competition is not modeled, and in order to focus on coalition governments, the election outcome is assumed to be such that no party has a majority. In order to focus on the process of governing, the time until the next required election is initially assumed to be infinite, and then a finite constitutional interelection period is considered. Both government organization and legislation are viewed as bargaining games, as in Baron and Ferejohn (1989).

The objective is to study the effect of confidence and censure proposals on government formation, stability, and cohesion, so the model incorporates events that may put the government at risk or provide temptation for a government member to defect. The model does so by allowing the current income of a member's constituents to change exogenously. A government thus may

⁴ Persson, Roland, and Tabellini (1996) also provide a comparison between presidential and parliamentary systems with a focus on the separation of powers.

⁵ Strom (1990, 111–3) discusses some of the preference-related and institutional factors that can affect this legislative bargaining.

⁶ Laver and Schofield (1990, 144–63) discuss this bargaining environment and relate it to the empirical literature.

change in one of two ways. First, a successful censure motion or the defeat of a legislative proposal to which a confidence motion is attached leads to an organization period. Second, a member of the government can withdraw from the coalition, resulting in the dissolution of the government. This may be in anticipation of a successful censure motion, but as Budge and Keman (1990, 59) argue, termination also may occur when the government parties are successful and united. For example, the government may anticipate electoral success, in which case termination is voluntary and based on opportunity.

The incentive to be in government results from its control of the agenda-setting process, which allows it to propose a redistribution of income.⁷ This may be viewed as corresponding to the selection of a minister to make a proposal in his or her policy jurisdiction; to simplify the model, policy jurisdictions will not be differentiated.⁸ Proposals by the opposition are considered in the context of censure motions.

The government members cannot commit to how they will redistribute income or to how they will vote on a proposal. That is, all actions must be rational at the time the member has an opportunity to act. Subgame perfect Nash equilibria will thus be characterized, and the focus is on stationary equilibria in which the same strategies are played in structurally equivalent subgames. Two subgames are structurally equivalent if and only if the sequence of moves is the same, the action sets are the same at each corresponding node, and the preferences of the players are the same in each period. The strategies in structurally equivalent subgames are assumed to depend only on a state that includes the payoff-relevant information in the history of play. A stationary equilibrium in this model is a stationary Markov perfect equilibrium, where the state σ_t at the beginning of a legislative period (t) is the government coalition, and the state at the beginning of an organization period is null.

To simplify the notation and facilitate the exposition, a basic model is presented first, and then extensions are considered. The parliament is assumed to have three parties, $i = 1, 2, 3$, no one of which holds a majority. As in Diermeier and Feddersen (1996), a purely distributive event occurs, which will be represented as a draw $x = (x_1, x_2, x_3) \in X \equiv \{x | x_i \geq 0, i = 1, 2, 3, \sum_{i=1}^3 x_i = 1\}$, where x is uniformly distributed over X , and the draws are independent over time. The events, which may be interpreted as fluctuations in the distribution of current income caused by the economy, represent the changing circumstances confronting the

government.⁹ Initially, aggregate current income is assumed to be a constant, which focuses the comparisons on the consequences of alternative institutional procedures.¹⁰ Lupia and Strom (1995) incorporate a random event and interpret it as future electoral prospects that provide a temptation to terminate the government and hold an early election. In their examples, those prospects also sum to a constant.

A government consists of a coalition $C \in \mathcal{C}$, where $\mathcal{C}$ is the set of all coalitions, including those with only one party. In each legislative period, the government controls the agenda and can respond to the event x with a party $l \in C$ selected to set the agenda by making a proposal $b^l \in X$ for the redistribution of income.¹¹ Initially, the party will be selected at random, and then the probability of selection will be allowed to differ among the members of the government. If a majority of parliament votes for b^l against the alternative x , then the income is divided according to b^l .¹² Otherwise the income is distributed according to x .¹³ A vote in a legislative period is an action from the set $Y = \{0, 1\}$, where 1 denotes a vote for b^l and 0 a vote for x . Voting is simultaneous, and the votes $y_i \in Y$, $i = 1, 2, 3$, result in enactment of b^l if and only if $\sum_{i=1}^3 y_i \geq 2$. Weakly dominated voting strategies conditional on the state are assumed to be eliminated.

Associated with the proposal b^l is a confidence or censure procedure as formalized below.¹⁴ If b^l is enacted, then government C continues in office in the next legislative period. If b^l is defeated, and hence a vote of confidence fails or a censure motion succeeds, then the next period is an organization period. The agenda setter is also assumed to be able to withdraw from the government, resulting in its dissolution.¹⁵ The process of responding to the event may be interpreted as intracoalitional bargaining with the opportunity to seek support from the out party. The sequence in a legislative period is illustrated in Figure 1, which does not depict the individual votes separately.¹⁶ If b_l is

⁹ The economy may also generate other income, so x is to be interpreted as the income available for redistribution.

¹⁰ This assumption is relaxed below.

¹¹ The model shares three features with the Lupia and Strom (1995) and Diermeier and Feddersen (1996) models. First, governing involves organization and legislative periods. Second, the government through its control of the agenda can respond strategically to events. Third, the events are exogenous.

¹² In the context of government expenditure programs, the proposal b^l can be interpreted as the distribution of spending, where x is the current-period reversion spending in the absence of new legislation.

¹³ Amendments or counterproposals by the out party are considered below.

¹⁴ For example, a confidence procedure may be invoked after the defeat of a government legislative proposal and hence is effectively attached to that proposal. Confidence and censure procedures are typically invoked only for major legislation, so the proposals considered here are intended to correspond to major legislation. Laver and Schofield (1990, 65–6), however, provide an example of a vote of confidence on the closing of a hospital.

¹⁵ Laver and Schofield (1990, 64, Table 4.1) summarize dissolution authority for twenty countries.

¹⁶ The model differs from that of Diermeier and Feddersen (1996) in three principal aspects. First, income is generated in both organization and legislative periods, which simplifies the notation and the analysis. Diermeier and Feddersen assume that there is income only

⁷ To simplify the notation and make the analysis more transparent, organization and legislative periods are assumed to be of equal length. If an organization period encompasses an election and the subsequent government formation process, then it could be lengthy. Merlo (1997) reports that in postwar Italy, for example, the government formation process had a mean duration of four weeks and a maximum of thirty-nine weeks.

⁸ Silk and Walters (1995) note that in the United Kingdom proposals are generally introduced by the minister in whose jurisdiction the bill is located.

FIGURE 1. Legislative Period

FIGURE 2. Organization Period

enacted in period t , then the state variable ($\sigma_{t+1} \in C \cup \phi$) in the next period is $\sigma_{t+1} = \sigma_t = C$, and if b_t is defeated or a member of the government withdraws

in a legislative period, an assumption that works in favor of government stability and cohesion. Their assumption is considered below in the context of minority governments. Second, the model has an infinite number of periods, whereas Diermeier and Feddersen consider a finite horizon. That horizon allows them to use backward induction, whereas here a stationary equilibrium is characterized. Third, the model incorporates political impatience, whereas Diermeier and Feddersen assume that the discount factor is one, although the finite horizon has an effect similar to a lower discount factor. A high discount factor favors government stability and cohesion, as will be demonstrated below.

resulting in government dissolution, then $\sigma_{t+1} = \phi$, where ϕ denotes an organization period.

In an organization period, a caretaker government is assumed to be in place, and that government cannot redistribute income. As illustrated in Figure 2, nature first selects a distribution of income ($x \in X$) and then selects at random a party ($i \in \{1, 2, 3\}$) to act as a formateur to propose a government coalition ($C \in C$). Since any two of the three parties is sufficient to form a government, the representation in parliament does not affect which government a formateur chooses. To preserve symmetry, the parties are assumed to have the same probability of being selected, so representation

may be thought of as the same for each party. This assumption will be relaxed below. In an empirical study of government formation processes in twelve countries during the postwar period, Diermeier and Merlo (1998) found strong support for selection of the formateur in proportion to representation, with a sizable premium for incumbency. They found no support for selection of the largest party as formateur. If the C proposed by the formateur is supported by a majority, then that coalition is installed as the government, and the game enters a legislative period with $\sigma_{t+1} = C$. If the coalition proposal is defeated, then another government organization period ensues with $\sigma_{t+1} = \phi$. The model begins with a government organization period, so $\sigma_0 = \phi$.

The interests of a party (l) are assumed to be derived from officeholding preferences, which depend on serving constituents. Preferences are assumed to be time separable and risk neutral and are represented by a utility function, u_l :

$$u_l(z(\cdot)) = \sum_{t=1}^{\infty} \delta^t z_l(t),$$

where ($\delta \in [0, 1)$) is a common political discount factor, and income $z_l(t) = x_l(t)$ if $\sigma_t = \phi$; if $\sigma_t \in C$, then

$z_l(t) =$

$$\begin{cases} b_l(t) & \text{if } \sum_{i=1}^3 y_i \geq 2, \text{ and } t \text{ is a legislative period,} \\ x_l(t) & \text{if } \sum_{i=1}^3 y_i < 2, \text{ or } t \text{ is an organization period,} \end{cases}$$

where $b_l(t)$ and $x_l(t)$ are, respectively, the proposal and current income in period t . Preferences of the parties are thus diametrically opposed or polarized, so there is nothing in the configuration of preferences that contributes to government stability.

The political discount factor is intended to reflect the impatience of party leaders to distribute income to constituents. Such preferences may be derived from officeholding preferences of party leaders and the willingness of constituents to shift allegiance from one party to another in response to the income allocated to them. Party leaders thus prefer to deliver income sooner rather than later. Alternatively, constituents may support parties retrospectively, based on what was done for them in the last legislative period. Similarly, the impatience of party leaders may result from intra-party politics that give them a relatively small window of opportunity to lead, and delivering income to constituents is crucial to continuing their leadership. In this context, δ may be interpreted as the probability that a party leader is replaced by another party member.

Performance of a parliamentary government will be assessed in terms of its stability, the cohesion of legislative voting by its members, and the resulting

distribution of income. Stability (s) will be measured by the probability that the members of the government in the current period constitute the government in the next period, so if a government member switches coalition partners each period, stability is one-half. The hazard rate (h) is defined as the probability that the government terminates in a period conditional on the time in office. Cohesion (c) is the probability that the members of a government vote together on legislation proposed by the government. The income distribution is measured by the expected income of the constituents of each party.

A MAJORITY CONFIDENCE PROCEDURE

Majority Governments

Under a majority confidence procedure, the government declares it will resign if its legislative proposal is defeated, and the political system then enters an organization period.¹⁷ In the model presented here, the majority vote need not come solely from the governing coalition; that is, opposition party members can support the government on a legislative proposal.

A government coalition (C) is identified as two parties ($C = \{i, j\}$), and the opposition or out party will be identified by k . The equilibrium considered first has, on the equilibrium path of play, a government formed in the first period, and in each subsequent legislative period the government obtains majority support for its proposal, so the government remains in office. The equilibrium is driven by two majoritarian incentives. The first is to redistribute income among as few parties as possible. Since the government has agenda-setting powers, the incentive to preserve the government results from this majoritarian incentive. The second majoritarian incentive is for a government party to redistribute more income to its constituents than to those of other government parties. This majoritarian incentive provides temptation that can lead to a break in government cohesion.

If income is redistributed only to government members, then the continuation value (v_l^M , $l \in C$) for a stationary equilibrium of the subsequent legislative subgame, in which in each period the majority (^{M}) coalition constitutes the government, is by symmetry

¹⁷ As in Huber (1996), this case corresponds to one in which no censure motion by the opposition can be expected. Huber considers a model in which members of the governing coalition make proposals, and then the prime minister invokes a confidence procedure; s/he chooses a proposal that all members of the coalition prefer to the alternative of terminating the government and conducting an election. Huber's model requires the support of all members of a government, which in the model considered here would result in both government stability and voting cohesion. This is the result of a dilemma faced by government partners who are compelled to support unfavorable legislation so as to maintain control of the agenda-setting process. This result is consistent with Huber's discussion of Prime Minister John Major's use of a confidence procedure to bring party members into line on the ratification of the Maastricht Treaty.

$$v_l^M = v^M \equiv \frac{1}{2(1-\delta)}, l = i, j. \quad (1)$$

In an organization period there is one unit of income, and since the parties are symmetric, the expected discounted future income in the subsequent legislative periods, once a government is formed, is $1/(3(1-\delta))$. Consequently, the expected income of a party (l) entering an organization period is $E(x_l) + \delta/(3(1-\delta)) = \frac{1}{3} + \delta/(3(1-\delta)) = 1/(3(1-\delta))$, which is the continuation value v_l^O ; that is,

$$v_l^O = v^O \equiv \frac{1}{3(1-\delta)}, l = i, j, k. \quad (2)$$

The incentive for a member of government to remain in office is represented by the difference between v^M and v^O , or $v^M - v^O = 1/(6(1-\delta))$.

In making a proposal (b^i) in a legislative period, the agenda setter (i) can attract the vote of either the other government member (j) or the out party (k), since either vote preserves the government under a majority confidence procedure. Consider, first, a proposal to j . Assume that party k has a dominant strategy of voting against b^i , and i has a dominant strategy of voting for it. If j votes for $b^i = (b_i^i, b_j^i, b_k^i)$, then the government is preserved, and the continuation value is v^M in equation 1. Party j 's expected income is then $b_j^i + \delta v^M = b_j^i + \delta/(2(1-\delta))$. If j votes against b^i , j 's expected income is $x_j + \delta v^O = x_j + \delta/(3(1-\delta))$, since the government falls, and the political system enters an organization period. Party j thus votes for b^i if and only if

$$b_j^i \geq x_j - \frac{\delta}{6(1-\delta)}. \quad (3)$$

The agenda setter (i) has an incentive to offer as little as possible to j , or

$$b_j^{i*} = \max \left\{ 0, x_j - \frac{\delta}{6(1-\delta)} \right\}. \quad (4)$$

Then, i and j will vote for $b^{i*} = (1 - b_j^{i*}, b_j^{i*}, 0)$ against x . As identified above, the term $\delta/(6(1-\delta)) = \delta(v^M - v^O)$ in equations 3 and 4 is j 's incentive to preserve the government for the future rather than enter an organization period. Because j has an incentive to remain in government, the income the agenda setter must provide to obtain j 's vote is lower than it otherwise would be. The agenda setter partially captures this incentive when $x_j < \delta/(6(1-\delta))$ and fully captures it when $x_j \geq \delta/(6(1-\delta))$, as indicated in equation 4.

If j 's current income (x_j) is high, then i must in equation 4 allocate substantial income to obtain its vote. The agenda setter could instead obtain k 's vote, and the minimum income required would be

$$b_k^{i+} = x_k + \frac{\delta}{3(1-\delta)}, \quad (5)$$

since k has an incentive, represented by the term $\delta/(3(1-\delta))$, to vote for x and enter an organization period. The proposal is then $b^{i+} = (1 - b_k^{i+}, 0, b_k^{i+})$, where party j is allocated zero, and i retains $b_i^{i+} = 1 - b_k^{i+}$.

The agenda setter always prefers to preserve the government because control of the agenda-setting process is valuable, and both the proposals satisfying equations 4 and 5 preserve control. If $b_j^{i*} = 0$ in equation 4, then i prefers to obtain j 's vote rather than k 's vote, since $b_k^{i+} > 0$ with probability one. Next, consider the case in which $b_j^{i*} > 0$. Letting w^{ij} denote i 's income when j 's vote is obtained, i prefers to obtain j 's vote rather than k 's vote if and only if

$$w^{ij} = 1 - b_j^{i*} + \delta v^M \geq w^{ik} = 1 - b_k^{i+} + \delta v^M,$$

or

$$\frac{\delta}{2(1-\delta)} \geq x_j - x_k. \quad (6)$$

This condition is satisfied for all x (e.g., $x_j = 1$ and $x_k = 0$) if and only if

$$\delta \geq \delta^* = \frac{2}{3},$$

in which case the voting cohesion of the government equals one. Note that the bound δ^* depends on the support of x and not on the distribution function.

The bound δ^* on the political discount factor reflects the coalition partner's interest in preserving the government, and that interest results from the government's control of the agenda-setting process. For $\delta \geq \delta^*$, the vote of the coalition partner is less costly than the vote of the out party, which has an incentive to vote against a proposal so as to enter an organization period in which it may have the opportunity to participate in the next government. Because of the partner's interest in preserving the current government, its support is less expensive than support from the out party when $\delta \geq \frac{2}{3}$.

The agenda setter also has the alternative of terminating the government and entering an organization period. As the following lemma indicates, the government will not terminate when the political discount factor is high.

LEMMA 1: For $\delta \geq \frac{2}{3}$, under a majority confidence procedure the agenda setter prefers to obtain the vote of its coalition partner rather than terminate the government.

Proof: The agenda setter (i) prefers to obtain j 's vote rather than enter an organization period if and only if

$$\begin{aligned} w^{ij} = 1 - b_j^{i*} + \delta v^M &= 1 - x_j + \frac{2\delta}{3(1-\delta)} \geq x_i + \delta v^O \\ &= x_i + \frac{\delta}{3(1-\delta)}. \end{aligned} \quad (7)$$

Since $x_i \leq 1 - x_j$, this condition is satisfied for all $x \in X$ and δ . *Q.E.D.*

Consequently, if $\delta \geq \frac{2}{3}$, in every legislative period the agenda setter offers

$$b^{i*} = (1 - b_j^{i*}, b_j^{i*}, 0); \quad (8)$$

coalition members i and j vote for it, and the out party (k) votes against it. The proof of lemma 1 also implies that the approach of required elections will not result in government termination under a majority confidence procedure when the political discount factor is high. For example, suppose that an election were required in the next period, in which case v^M would be replaced by v^O in equation 7. Then, since $x_i \leq 1 - x_j$, the agenda setter still prefers to obtain the coalition partner's vote rather than terminate the government.

When the future is very important relative to the present ($\delta \geq \frac{2}{3}$), the government remains in office in every period, so stability is $s = 1$, and the cohesion of the parliamentary government with a majority confidence procedure is $c = 1$. Stability is maximal because, when δ is high, the incentive to maintain control of the agenda-setting process by preserving the government is greater than the temptation to terminate the government, take the current income x_i , and enter an organization period. Cohesion is maximal because the agenda setter finds coalition member j 's vote less expensive than the vote of the out party. This, however, is not a direct effect, since the incentive rests with j , who must choose between preserving the government and receiving $b_j^{i*} + \delta v^M$ or forcing a reorganization and receiving $x_j + \delta v^O$. By putting j in this position, i is able to capture some or all of j 's incentive to preserve the government and its associated control of the agenda-setting process. This induces i to obtain the vote of j rather than that of k , even when j 's current income (x_j) is high and k 's is low.

When the future is less important relative to the present ($\delta < \frac{2}{3}$), however, the agenda setter has an incentive to seek the vote of the out party when coalition member j 's reservation income (x_j) is high and x_k is low. In this event, k acts as a supporting party for the government.¹⁸ Strom (1990, 110–1) refers to this as an ad hoc majority and relates its likelihood to institutional features, such as investiture requirements and legislative committee structure. If on the equilibrium path for some $x \in X$ the agenda setter obtains k 's vote and the government is preserved, then k 's continuation value (v_k) is positive. The continuation value of a member of the government thus is reduced to $1/2(1 - \delta) - v_k/2$. When the agenda setter solicits the vote of k with positive probability, k 's vote is less costly. Also, j 's vote is more costly because preserving the government is less valuable when an agenda setter

solicits the support of the out party with positive probability. Party k will vote for an offer ($\hat{b}_k^i$) when

$$\hat{b}_k^i = x_k + \frac{\delta}{3(1 - \delta)} - \delta v_k, \quad (9)$$

where the right-hand side is positive, since $v_k \leq 1/(3(1 - \delta))$. Proceeding as above, the condition corresponding to equation 6 is

$$\frac{\delta}{2(1 - \delta)} - \frac{3\delta}{2} v_k \geq x_j - x_k, \quad (10)$$

where

$$\hat{b}_j^i = \max \left\{ 0, x_j - \frac{\delta}{6(1 - \delta)} + \frac{\delta}{2} v_k \right\}. \quad (11)$$

The agenda setter obtains k 's vote for all x such that equation 10 is not satisfied.

On the equilibrium path, i prefers to obtain j 's or k 's vote rather than terminate the government, as established in the following lemma.

LEMMA 2: For no $x \in X$ and $\delta \in [0, 1)$ does the government terminate.

Proof: Lemma 1 establishes this for $\delta \geq \frac{2}{3}$. Consider $\delta < \frac{2}{3}$, and suppose i obtains j 's vote. The government will not terminate if w^{ij} is at least i 's expected income ($x_i + \delta/(3(1 - \delta))$) from dissolution of the government. This requires

$$\begin{aligned} w^{ij} &= 1 - \hat{b}_j^i + \left(\delta v^M - \frac{\delta}{2} v_k \right) \\ &= 1 - x_j + \frac{2\delta}{3(1 - \delta)} - \delta v_k \geq x_i + \frac{\delta}{3(1 - \delta)}, \end{aligned}$$

or

$$1 - x_j - x_i \geq -\delta \left(\frac{1}{3(1 - \delta)} - v_k \right).$$

Since agenda control is valuable, $v_k \leq \delta/(3(1 - \delta))$, and the inequality is satisfied for all $x \in X$. Thus, i prefers to obtain j 's vote rather than to terminate the government. *Q.E.D.*

The out party (k) receives income for $x \in X$, such that equation 10 is not satisfied, and k 's continuation value ($\hat{v}_k$) satisfies the recursion relation

$$\hat{v}_k = E_x \hat{b}_k^i + \delta \hat{v}_k, \quad (12)$$

where $E_x \hat{b}_k^i \equiv E_{x|x_j - x_k \leq 3\delta/(2(1 - \delta)) - \delta/2v_k} \hat{b}_k^i$ is the expected income of k in i 's proposal.

Letting $\hat{v}_k$ be the value satisfying equation 12, if $\delta < \frac{2}{3}$ and if equation 10 is not satisfied, then in equilibrium the agenda setter offers

$$\hat{b}_k^i = x_k + \frac{\delta}{3(1 - \delta)} - \delta \hat{v}_k \quad (9a)$$

¹⁸ See Laver and Schofield (1990, 67) for a discussion of "support parties."

to k and otherwise offers $\hat{b}_j^i$ in equation 11 to j . In either event the government remains in office. The continuation values ($\hat{v}_l^M$) for the members of government satisfy the recursion relation

$$\hat{v}_l^M = \frac{1}{2}(1 - E_x \hat{b}_k^i) + \delta \hat{v}_l^M, l = i, j. \quad (13)$$

For example, if $\delta = 0$, the agenda setter offers $\hat{b}_k^i$ in equation 9 to k with probability one-half, and $\hat{v}_k = \frac{1}{2}$. For $\delta = 0.5$, $\hat{v}_k = 0.1312$, and $\hat{v}_i^M = \hat{v}_j^M = 0.4344$. As δ increases, the probability that the agenda setter obtains the vote of the coalition partner increases and equals one for $\delta \in [\frac{2}{3}, 1)$.

The equilibrium is summarized in the following proposition.

PROPOSITION 1: *With a majority confidence procedure, if $\delta \geq \frac{2}{3}$, then the agenda setter (i) in government $C = \{i, j\}$ proposes b_j^{i*} in equation 4 for all $x \in X$, and parties i and j vote for the proposal, and party k votes against it. If $\delta < \frac{2}{3}$, then i offers $\hat{b}_j^i$ in equation 11 to j if equation 10 is satisfied and offers $\hat{b}_k^i$ in equation 9 to k if equation 10 is not satisfied. In the former case, i and j vote for the proposal, and k votes against it; in the latter case, i and k vote for the proposal, and j votes against it.*

The voting cohesion of the government can be determined with the aid of Figure 3. Voting is perfectly cohesive for $x \in \bar{X}^c(\delta) = \{x \in X | x_j - x_k \leq \delta/(2(1 - \delta)) - (3\delta/2)\hat{v}_k\}$, and it is less cohesive if $x \in \bar{X}^n(\delta) = X - \bar{X}^c(\delta)$. Cohesion ($c(\delta)$) is given by

$$\begin{aligned} c(\delta) &= Pr(x \in \bar{X}^c(\delta)) \\ &= 1 - 2\left(\frac{1}{2} - \frac{\delta}{4(1 - \delta)} + \frac{3\delta}{4}\hat{v}_k\right)^2 \end{aligned} \quad (14)$$

For $\delta = 0$, $c(0) = \frac{1}{2}$, since as noted above the agenda setter obtains the vote of k whenever $x_k < x_j$. For $\delta \in (0, \frac{2}{3})$, $c(\delta) \in (\frac{1}{2}, 1)$ and is increasing in δ . Even though cohesion is less than one, the government is completely stable ($s = 1$) under a majority confidence procedure. The hazard rate is thus zero.

This characterization of cohesiveness can also be used to define the set of critical events in which a government member votes against a government proposal and the out party preserves the government by voting for the proposal. As indicated in Figure 3, a critical event is one in which x_j is high and x_k is low, so the government partner's vote is expensive, and the out party's vote is inexpensive. The set $\bar{X}^n(\delta)$ of events critical for cohesion is thus composed of extreme events, and these are more extreme the higher is δ . Moreover, if x_j is high, then x_i for the agenda setter is low. This may be interpreted as conflict within the government. Cohesion thus is lower when there is conflict within the government and the out party's support can be obtained at a low cost.

The equilibrium distribution of income depends on δ . If $\delta \geq \frac{2}{3}$, then income is distributed only to members of the coalition, so their ex ante expected income

FIGURE 3. Cohesion Set and Critical Events

is $\hat{v}^M$ in equation 1. Conditional on party i being the agenda setter, party j receives b_j^{i*} in equation 4, which has an expected value

$$\begin{aligned} E_x b_j^{i*} &= \int_{\delta/(6(1-\delta))}^1 \left(x_j - \frac{\delta}{6(1-\delta)}\right) 2(1-x_j) dx_j = \\ &= \frac{1}{3} \left(1 - \frac{\delta}{2(1-\delta)} + \frac{\delta^2}{12(1-\delta)^2} - \frac{\delta^3}{216(1-\delta)^2}\right), \end{aligned} \quad (15)$$

where $f(x_j) = 2(1 - x_j)$ is the density function of x_j . For example, if $\delta = \frac{2}{3}$, then $E_x b_j^{i*} = \frac{8}{81}$. The agenda setter receives $1 - E_x b_j^{i*}$, and party k receives zero. Income is redistributed in favor of the government members and particularly in favor of the agenda setter. If the political discount factor is less than $\frac{2}{3}$, k has a positive continuation value ($\hat{v}_k$) given in equation 12 and a positive expected payoff in the current period. As δ increases, k 's income share increases as the cohesion of the government decreases. The expected incomes and continuation values ($\hat{v}^M$) in equation 13 of the constituents of the government members are thus lower when voting is less cohesive. That is, cohesion and the incomes of the government members' constituents are positively correlated.

The properties of the equilibrium are summarized in the following proposition.

PROPOSITION 2: *For all $\delta \in [0, 1)$, the government is perfectly stable ($s = 1$), and the hazard rate (h) is zero. For $\delta \geq \frac{2}{3}$, income is redistributed only to members of the government, and the expected current*

period incomes of i and j are $E_x b_j^{i*}$ in equation 15 and $1 - E_x b_j^{i*}$, respectively. For $\delta \geq \frac{2}{3}$, $c(\delta) = 1$. For $\delta < \frac{2}{3}$, $c(\delta) \in [\frac{1}{2}, 1)$ is given in equation 13 and is increasing in δ , and the expected current period income of k is positive.

Although the model has been formulated to make government stability difficult, a majority confidence procedure initiated by the government results in government stability. This is due to two institutional features of the model. First, the parliamentary system enables the government to control the legislative agenda, which creates an incentive for the government parties to preserve their control. If the out party can challenge that control by making a counterproposal, however, then the government can terminate, as will be demonstrated below. Second, under this confidence procedure the government is preserved by a majority vote. Without a confidence procedure, the government would change with the majority that supports a proposal; that is, the agenda setter would include in the next government the party that supported the current proposal, so cohesion and stability would be one-half.

Minority Governments

The preceding analysis pertains to a majority government, but in an organization period the formateur may form a minority government.¹⁹ A minority government makes a proposal in every legislative period in which it remains in office, and to remain in office under the majority confidence procedure, party i must obtain in each period the vote of one other party. A party l , $l \neq i$, has a reservation value, $x_l + \delta/(3(1 - \delta))$, since rejection leads to an organization period. The agenda setter will make an offer (b_l^i) to the party with the lower reservation value, so

$$b_l^i = \min \{x_j, x_k\} + \frac{\delta}{3(1 - \delta)} - \delta \bar{v}^o,$$

where $l \in \{j, k\}$ denotes the party with $x_l = \min \{x_j, x_k\}$, and $\bar{v}^o$ is the continuation value of a party that is out of government. The income b_l^i is nonnegative if $\bar{v}^o \leq 1/3(1 - \delta)$, which will be assumed and then verified below.

The minority government (i) has the choice in each legislative period of proposing $b^i = (1 - b_l^i, b_l^i, 0)$ or terminating the government, taking x_i , and entering an organization period for which the continuation value is $v^o = 1/3(1 - \delta)$. Party i thus will propose b^i if and only if

$$1 - b_l^i + \delta v^m \geq x_i + \frac{\delta}{3(1 - \delta)},$$

¹⁹ For 1945–87, Strom identified 341 minority governments in fifteen countries with at least two such governments during that period. Forty-eight percent ended in a crisis or defeat on a confidence or censure procedure, and the others terminated as a result of an early election.

or

$$1 - \min \{x_j, x_k\} - \frac{\delta}{3(1 - \delta)} + \delta \bar{v}^o + \delta v^m \geq x_i + \frac{\delta}{3(1 - \delta)},$$

where v^m is the continuation value for a minority government. This condition is satisfied for all x , since $1 - \min \{x_j, x_k\} \geq x_i$, and $\delta \bar{v}^o + \delta v^m = (\delta/2)(v^m + 1/(1 - \delta)) \geq 2\delta/(3(1 - \delta))$ when $v^m \geq 1/(3(1 - \delta))$.²⁰ Consequently, a minority government can make an acceptable proposal and hence stay in office with support from one of the other two parties.

The continuation value satisfies the recursion relation

$$v^m = 1 - E_x b_l^i + \delta v^m,$$

which has the solution

$$v^m = \frac{5 - 4\delta}{3(1 - \delta)(2 - \delta)}. \quad (16)$$

The continuation value of the other parties is thus

$$\bar{v}^o = \frac{1 + \delta}{6(1 - \delta)(2 - \delta)}, \quad (17)$$

and the expected income of the party that votes for the minority government's proposal is

$$E_x b_l^i = \frac{1 + \delta}{3(2 - \delta)}.$$

The continuation value (v^m) for a minority government is greater than the continuation value ($v^M = 1/(2(1 - \delta))$) for a majority government if and only if $\delta < \frac{4}{5}$.²¹ Consequently, in an organization period, the formateur prefers a majority government if the future is very important ($\delta \geq \frac{4}{5}$) and a minority government if the future is less important. A minority government thus is both sustainable and preferred by the formateur in an organization period when $\delta < \frac{4}{5}$. Whether a minority government will be formed and installed in an organization period is considered next.

Government Organization

The formateur in an organization period will never propose a surplus or consensus government, $C = \{i, j, k\}$, since the value of that government is $1/(3(1 - \delta))$, whereas the value of a majority or a minority government is greater. That is, the formateur chooses not to share agenda control in a grand coalition.

As indicated above, the formateur prefers a majority government only if $\delta \geq \frac{4}{5}$. In that case, a majority

²⁰ The equality follows, since $v^m + 2\bar{v}^o = 1/(1 - \delta)$, and $v^m \geq 1/(3(1 - \delta))$ is implied by $\bar{v}^o \leq 1/(3(1 - \delta))$.

²¹ The continuation value v^m is also greater than the continuation value $v^M = v^M - \frac{1}{2}v_k$ for $\delta < \frac{2}{3}$.

government will be installed, since a party invited to join the coalition has a continuation value of $v^M = 1/(2(1 - \delta))$, whereas rejecting the offer results in a continuation value of $v^O = 1/(3(1 - \delta))$.

If $\delta < \frac{4}{5}$, the formateur prefers a minority government. With the organizational process in Figure 2, however, a proposal to form a minority government will be rejected. To see this, suppose that i proposes a minority government. Party l can support that government and have a continuation value of $\bar{v}^O$ (equation 17) or reject the proposal and enter another organization period with a continuation value of $1/(3(1 - \delta))$. Comparing these two indicates that

$$\bar{v}^O = \frac{1 + \delta}{6(1 - \delta)(2 - \delta)} \leq \frac{1}{3(1 - \delta)},$$

which is satisfied for all $\delta \in [0, 1]$.²² A minority government will thus not receive the support needed for installation. This establishes the following proposition.

PROPOSITION 3: *With a majority confidence procedure, a minimal winning government forms.*

Consequently, only minimal winning coalitions result with a majority confidence procedure. This is also the case for the other confidence and censure procedures considered below.

A minority government could be installed, however, if the formation process were different from that in Figure 2.²³ Consider a model in which there is no income (x) in an organization period. If the formateur proposes a minority government and party l votes to install it, l 's payoff will be $0 + \delta\bar{v}^O$. If l rejects the proposal, another organization period will commence, again with no x . The payoff to l will then be $0 + 0 + \delta^2/3(1 - \delta)$, where $\delta^2/3(1 - \delta)$ is the discounted continuation value from returning to the equilibrium path on which some government is formed. Then, using equation 17 and

$$\begin{aligned} \delta\bar{v}^O - \frac{\delta^2}{3(1 - \delta)} &= \frac{\delta(1 + \delta)}{6(1 - \delta)(2 - \delta)} - \frac{\delta^2}{3(1 - \delta)} \\ &= \delta \frac{1 - 2\delta}{6(2 - \delta)}, \end{aligned}$$

l will support a minority government if $\delta < \frac{1}{2}$. Consequently, a minority government can be formed and sustained in every legislative period in this variant of the basic model, since if l rejects a minority government, it will lose income in the following period. This is a sufficient incentive to allow a minority government to be formed when the political discount factor is low.

Extensions of the Basic Model

The model may be extended in a number of directions without changing the qualitative properties of the results. Three extensions are considered in this section. The first relates to the number of parties in parliament. The second involves the share of parliamentary seats. The third concerns the distribution of current income. A fourth extension incorporating required elections is considered later.

An n -Party Parliament. Consider an n -party parliament. First, majoritarian incentives imply that the government formed is a minimal majority. Second, consider the bound $\delta^*(n)$ on the political discount factor, such that for all higher discount factors, income is redistributed only within the majority coalition; that is, cohesion equals one. Majoritarian incentives imply that the party recognized to make a legislative proposal will, for all $x \in X$, seek the votes of all its $(n - 1)/(2$ coalition partners if and only if $\delta \geq \delta^*(n) \equiv (n + 1)/(n + 3)$. That is, the agenda setter redistributes income to a minimal majority of parties, and since the members of the governing coalition have an interest in preserving the government and its agenda control, their votes are less costly than the votes of the opposition. The bound $\delta^*(n)$ is a strictly increasing function of n with a limit of one. Parliaments are thus cohesive over a smaller set of political discount factors, the greater is the number of parties. Political systems with a larger n are thus less likely to be cohesive. With a majority confidence procedure, however, stability equals one for all n , since support from either the government or the out parties is sufficient to preserve the government.

Differences in Party Size. The members of the government coalition (C) could have different probabilities of being the agenda setter in a legislative period if the number of their portfolios or their seat shares differ. Browne and Franklin (1973) and Browne and Frensdreis (1980) found that the number of ministries held is strongly proportional to seat share. In this model, seat share corresponds to the probability of being the agenda setter in a period. Suppose that $i \in C$ has probability p of being selected as the agenda setter, and $j \in C$ has probability $1 - p$. Also, let $v_i^M(p)$ and $v_j^M(p)$ denote the corresponding continuation values in an equilibrium in which, for all $x \in X$, the agenda setter obtains the vote of the other government member. This requires that

$$\delta v_i^M(p) \geq x_j - x_k, \quad (6a)$$

and

$$\delta v_j^M(p) \geq x_i - x_k. \quad (6b)$$

As p increases, $v_i^M(p)$ increases, and $v_j^M(p)$ decreases, so i has a stronger and j a weaker incentive to remain in the government. This means that as p

²² This verifies the assumption that $\bar{v}^O \leq 1/(3(1 - \delta))$, made in the previous section.

²³ A majority government will also form in an organization period if the current income can be redistributed as part of the government formation proposal.

TABLE 1. Continuation Values for a Majority Confidence Procedure

$\delta = 0.9$			$\delta = 0.8$		
p	$v_i^M(p)$	$v_j^M(p)$	p	$v_i^M(p)$	$v_j^M(p)$
0.5	5.000	5.000	0.5	2.500	2.500
0.6	5.333	4.667	0.6	2.807	2.193
0.7	5.667	4.333	0.7	3.016	1.984
0.8	6.000	4.000	0.8	3.156	1.843
0.9	6.333	3.667	0.9	3.257	1.743
1.0	6.667	3.333	1.0	3.333	1.667

Note: The continuation values sum to $1/(1 - \delta)$.

increases, i must redistribute more income to obtain j 's vote; when j is the agenda setter, it needs to redistribute less income to i to obtain i 's vote. In equilibrium, when δ is such that equations 6a and 6b are satisfied for all $x \in X$, the continuation values satisfy the recursion relations

$$v_i^M(p) = p(1 - E_x b_i^j) + (1 - p)E_x b_i^i + \delta v_i^M(p) \quad (1a)$$

and

$$v_j^M(p) = pE_x b_j^i + (1 - p)(1 - E_x b_j^j) + \delta v_j^M(p), \quad (1b)$$

where

$$E_x b_j^i = \int_{\delta v_j^M(p) - \delta/(3(1-\delta))}^1 \left(x_j - \delta v_j^M(p) + \frac{\delta}{3(1-\delta)} \right) \cdot 2(1 - x_j) dx_j = \frac{1}{3} - A_j + A_j^2 - \frac{1}{3} A_j^3,$$

$A_j = \delta v_j^M(p) - \delta/(3(1 - \delta))$, and $E_x b_i^j$ and A_i are defined analogously.

Then, defining $p^*(\delta)$ as the maximum p , such that equations 6a and 6b are satisfied, for $p^*(\delta) \geq p \geq \frac{1}{2}$ there is an equilibrium in which government stability and cohesion equal one and the hazard rate is zero. For $p \geq p^*(\delta)$, the equilibrium involves redistribution to the out party, and the characterization of the equilibrium is as above in equations 6–12. As examples, for $\delta = 0.8$ and $\delta = 0.9$, equations 6a and 6b are satisfied for all δ , so $p^*(\delta) = 1$, $\forall \delta \in [0, 1]$. The continuation values $v_i^M(p)$ and $v_j^M(p)$ are presented in Table 1, and as p increases, the continuation value of the party with the higher probability of being the agenda setter increases. If that probability reflects the seat share of the parties in the coalition, then the value of being in the government is increasing in a party's seat share.

These results can be used to extend the government formation results. Suppose, for example, that the various seat shares are such that $p_i > p_k > p_j$ and $p_i/(p_i + p_k)$ is less than $p^*(\delta)$ for all $l, q \neq l$. The formateur thus can choose between forming a government with either a large or a small party. Suppose that i is the formateur, the ministries are allocated in proportion to seat share, and the probability of being selected to make a legislative proposal equals that proportion. Then, i chooses between legislative periods in which its

probability of being the agenda setter is $p^{ij} = p_i/(p_i + p_j)$ or $p^{ik} = p_i/(p_i + p_k)$. Since the former is greater than the latter, and the continuation value in Table 1 is increasing in p , the formateur forms a government with the smaller of the other two parties. The government thus includes the smallest party.

The Distribution of Current Income. The above characterization assumes that the distribution of current income is uniform on x and that the sum of current incomes equals one. To investigate the comparative statics of the distribution of income, note that the condition in equation 6 for cohesion to equal one, the condition in equation 7 for stability to equal one, and lemma 2 depend only on the support for the distribution. Consequently, if the distribution of x is such that $E x_l = \frac{1}{3}$ and $x_l \in [0, 1]$, $l = i, j, k$, then the results in propositions 1 and 2 hold with the exception that the continuation value v_k depends on the probability distribution.

To explore the robustness of the assumption that aggregate income equals one, consider an alternative model in which the current incomes (x_l) have support $[0, x^+]$ and a mean $E x_l = \frac{1}{3}$.²⁴ This could represent fluctuations in aggregate economic activity, with incomes high in a growth period and low in a recession. For example, suppose that x_l , $l = i, j, k$, has a triangular density function, $f(x_l) = 8x_l$ if $x_l \in [0, \frac{1}{2}]$, and $f(x_l) = 0$ otherwise. Then, the government never terminates, and cohesion is one for all $\delta \geq \frac{1}{2}$.

For other distributions, however, voluntary termination of the government may occur. Letting v_k' denote k 's continuation value, termination results if either

$$x_j - x_k \leq \frac{3\delta}{2} \left(\frac{1}{3(1-\delta)} - v_k' \right) \text{ and} \\ x_i \geq 1 - x_j + \delta \left(\frac{1}{3(1-\delta)} - v_k' \right), \quad (18)$$

or

$$x_j - x_k > \frac{3\delta}{2} \left(\frac{1}{3(1-\delta)} - v_k' \right) \text{ and}$$

²⁴ Restricting the means to equal $\frac{1}{3}$ allows the expressions for the continuation values in equations 1 and 2 to be used.

$$x_i \geq 1 - x_k - \frac{\delta}{2} \left(\frac{1}{3(1-\delta)} - v'_k \right), \quad (19)$$

where the first inequalities correspond to equation 6 and the second to equation 7. Examination of these conditions indicates that termination occurs when δ is low and when the incomes x_i and either x_j or x_k are high.

As an example, if $f(x_i)$ is uniform on the interval $[0, \frac{2}{3}]$, then cohesion equals one if $\delta \geq \frac{4}{7}$, and stability equals one if $\delta \geq \frac{1}{2}$. For lower discount factors, however, the government voluntarily terminates with positive probability. As another example, if $f(x_i) = 2(1 - x_i)$ for $x_i \in [0, 1]$, then cohesion equals one for $\delta \geq \frac{2}{3}$, but stability equals one only for $\delta \geq \frac{3}{4}$. For discount factors below $\frac{3}{4}$, the government voluntarily terminates with positive probability.

Termination results when current income is high, since in that case the agenda setter has a strong temptation (x_i high) to terminate the government and a weak incentive ($1 - x_j$ or $1 - x_k$ low) to attract the support of another party to continue the government. In contrast, when the sum of current income is restricted to equal one, a strong temptation (x_i high) to terminate the government is necessarily accompanied by a strong incentive ($1 - x_j$ or $1 - x_k$ low) to continue the government. As lemma 2 indicates, the latter is always stronger than the former.

The case in which the aggregate income is not a constant may be interpreted as representing fluctuations in economic activity. For example, suppose that $x_l = x'$, $l = i, j, k$, where x' is uniformly distributed on $[0, \frac{2}{3}]$. Then, termination occurs only if $\delta < \frac{1}{2}$ and $x' > \frac{1}{2}$. For termination to result, the government must value highly the present relative to the future, and when that is the case, the government terminates in good times and remains in office in bad times. This is consistent with Budge and Keman's (1990) observation that termination may occur when the government parties are strong. This provides an explanation for calling early elections. It also indicates that fluctuations in the economy can affect government duration and termination.

The results from these extensions are summarized in the following proposition.

PROPOSITION 4: *With a majority confidence procedure,*

- (1) *cohesion is lower, the greater the number of parties;*
- (2) *if seat share increases the probability of being the agenda setter, the value of being in government increases with seat share, and to increase its agenda-setting probability, the formateur will choose as partner the party with the smaller seat share, so the smallest party is in government with probability one; and (3) the government may voluntarily terminate or call an early election, which occurs in good and not bad economic times for the agenda setter and is more likely when the parties are more politically impatient.*

OPPOSITION MOTIONS OF CENSURE

To maintain consistency with the models above, a motion of censure or no confidence made by the opposition will be specified as attached to a counterproposal or an amendment by the opposition.²⁵ That counterproposal may be thought of as an alternative to the government's proposal. Assume that i in the current government $C = \{i, j\}$ makes proposal b^i to attract j 's vote under a majority confidence procedure. To defeat the government, the out party (k) can make a counterproposal (b^k) as a motion of censure and attract j 's vote. The parliament votes on the two proposals and then on the winner versus x . If the motion of censure (b^k) fails and b^i defeats x , then the current government remains in office. The expected value for j is then $b_j^i + \delta v^c$, where v^c is the continuation value of a coalition member in a system with a censure procedure. If the motion of censure succeeds, then the next period is an organization period, and the expected value for j is $b_j^k + \delta/(3(1 - \delta))$. Initially, the equilibrium considered has failure of any censure motion and hence preservation of the government; that is, a bound on the political discount factor will be found such that, for all higher δ , the out party will be unable to offer a successful censure motion for any $x \in X$. Thus, $v^c = 1/(2(1 - \delta))$.

In its counterproposal, k is willing to redistribute all the current period income ($b_j^k = 1$) to obtain j 's vote on the motion of censure, since its only opportunity to be in government is to unseat the incumbent. Such a proposal would not be credible, however, since on final passage k would vote for x over b^k for any $x_k > 0$. That is, both voting for b^k and voting for x lead to an organization period, so when $x_k > 0$, k will vote for x , which yields income x_k in the current period, over b^k , which offers no income. Hence, the most k can credibly offer to j is $b_j^k = 1 - x_k$. To preclude j 's support for a motion of censure, the government agenda setter (i) thus must provide j with income $\hat{b}_j^i$, given by

$$\hat{b}_j^i = \max \left\{ 0, 1 - x_k - \frac{\delta}{6(1 - \delta)} \right\}. \quad (20)$$

The right-hand side of equation 20 is zero for all x_k if $\delta \geq \frac{6}{7}$ and is strictly less than one, so i can preclude a successful censure motion if the political discount factor is sufficiently high.

Although a successful censure motion attached to a counterproposal can be precluded by the initial choice of proposal b^i , a censure motion can cause the government to terminate. That is, if $\hat{b}_j^i$ in equation 20 is very costly or the current income x_i is very attractive, i could voluntarily terminate the government, resulting in an

²⁵ An alternative procedure would be a motion of censure by the opposition with no counterproposal. That is, if the motion is successful, then x is distributed in the current period, and an organization period follows. Such a motion would be defeated by either the proposal b_j^{i*} in equation 4 or the proposal with b_k^{i*} in equation 5, so the equilibrium would be the same as that with a majority confidence procedure.

organization period and income $x_i + \delta/(3(1 - \delta))$. The agenda setter thus will offer $\hat{b}_j^i$ rather than terminate the government if and only if

$$1 - \hat{b}_j^i + \frac{\delta}{2(1 - \delta)} \geq x_i + \frac{\delta}{3(1 - \delta)},$$

or

$$\hat{b}_j^i \leq 1 - x_i + \frac{\delta}{6(1 - \delta)}. \quad (21)$$

The condition in equation 21 is satisfied for all δ if $x_k \geq 1 - \delta/(6(1 - \delta))$, since in that case $\hat{b}_j^i = 0$. If $\hat{b}_j^i > 0$, then equation 21 is

$$1 - x_k - \frac{\delta}{6(1 - \delta)} \leq 1 - x_i + \frac{\delta}{6(1 - \delta)},$$

or

$$x_i - x_k \leq \frac{\delta}{3(1 - \delta)}. \quad (22)$$

The maximum of the left-hand side is one, and if $\delta \geq \frac{3}{4}$, this is satisfied for all x . The agenda setter then proposes $\hat{b}_j^i$, and no censure motion is made.

If $\delta < \frac{3}{4}$, however, then i prefers to terminate the government for some $x \in X$. Letting $\hat{v}^c(\delta)$ be the continuation value for a government party, the condition analogous to equation 22 is

$$x_i - x_k \leq 2\left(\delta \hat{v}^c(\delta) - \frac{\delta}{3(1 - \delta)}\right). \quad (23)$$

If this condition is not satisfied, i terminates the government rather than be defeated on a motion of censure. The motion of censure attached to b^k thus never comes to a vote, since the agenda setter terminates voluntarily. It is not the censure motion that i seeks to avoid, since both termination and successful censure result in an organization period. Instead, i seeks to avoid the counterproposal that gives zero to i .²⁶ A motion of censure thus can be effective in forcing government dissolution.

As illustrated in Figure 4, a censure motion forces dissolution when equation 23 is not satisfied; that is, for $x \in X^F(\delta) \equiv \{x | x_i > x_k + 2(\delta \hat{v}^c(\delta) - \delta/(3(1 - \delta)))\}$, the agenda setter terminates the government. For $x \in X^S(\delta) \equiv X - X^F(\delta)$, both i and j vote for $\hat{b}^i$ against b^k and against x , so the government is sustained. The stability (s) of the government under a censure procedure is thus in the interval $[\frac{1}{2}, 1]$, and the hazard rate (h) is $1 - s$.²⁷ For example, if $\delta = 0$, then $s = c = \frac{1}{2} = h$.

In contrast to the case of a majority confidence procedure illustrated in Figure 3, the critical events—those that lead to the dissolution of government—are

²⁶ Party k cannot gain by offering an increment (a) to i , since a must be taken away from j .

²⁷ Cohesion is not defined when the agenda setter terminates the government, so c here is the probability of termination.

FIGURE 4. Opposition Motion of Censure

extreme in the sense that x_i is high relative to x_k . This indicates that it is a combination of opportunity (a high x_i) and a credible threat (a low x_k) that provides the incentive to terminate the government.²⁸ The success of a censure motion hinges on both. First, for a chance to be in the next government, the out party is willing to offer as much current income as is credible to enter an organization period. Second, although the agenda setter can always offer more than the out party, if the required offer becomes too expensive, it may prefer to terminate the government, take the current income, and enter an organization period. This may be interpreted as calling an early election. This analysis thus indicates that an early election is called when economic times are good for the agenda setter (x_i high) and bad for the out party. Warwick (1992) and Merlo (1997) found that governments are more likely to terminate in bad times than in good. The prediction of my theory is consistent with their findings if the bad times are for the constituents of the out party and the government's partner.

A censure motion attached to a counterproposal thus threatens government stability and cohesion unless the political discount factor is high ($\delta \geq \frac{3}{4}$). In that case, the incentive to maintain control of the agenda-setting process is sufficiently strong for all x that the agenda setter prefers to offer its coalition partner enough to cause it to reject any censure proposal. The government members then capture all the income. For a lower discount factor ($\delta < \frac{3}{4}$), the censure procedure can cause the government to terminate with positive probability, because precluding the motion can be more costly for the agenda-setter than calling an early election when times are good.

The equilibrium with a censure or no-confidence procedure is summarized in the following proposition.

²⁸ Since x_i is high, x_j must be low, so termination results when there is conflict within the government.

PROPOSITION 5: For $\delta \geq \frac{3}{4}$, the possibility of a censure motion attached to a counterproposal results in the government party proposing $\hat{b}_j^i$ in equation 20 for all x ; both coalition members i and j vote for the proposal, and k votes against it. For $\delta < \frac{3}{4}$, dissolution of the government may result, since the agenda setter voluntarily terminates the government if equation 23 is not satisfied. If $\delta \geq \frac{3}{4}$, the stability and cohesion of the government are one, the hazard rate is zero, and income is redistributed only to members of the government. If $\delta < \frac{3}{4}$, stability and cohesion are less than one, and $h = 1 - s \in [0, \frac{1}{2}]$. The out party then receives income x_k with positive probability.

REGULARLY SCHEDULED ELECTIONS

Regularly scheduled elections place the government's control of the agenda-setting process in jeopardy and hence lessen the value of that control. This reduces the incentive of a government member to preclude a censure motion, since the future value from preserving the government is reduced by the approaching required election. An election may be required every T periods or at T periods after the previous election. The equilibria corresponding to these two cases are similar, so the analysis will assume a required election at T legislative periods after a government is formed either as a result of mandatory election or of voluntary dissolution. As above, in an election it is assumed that no party receives a majority in the parliament, and hence each party is equally likely to be in the next government.

For a given constitutional interelection period T , let $\tau \leq T$ be the number of periods remaining until the next election, where the length of a period depends on how rapidly events occur. The equilibrium to be characterized is one in which the current government precludes a censure motion that would result in its dissolution. If the motion were successful, then the continuation value would be $v^O = 1/(3(1 - \delta))$. If the current government were to remain in office until the next election, the continuation value would be

$$v^c(\tau) = \frac{\delta}{2} + \frac{\delta^2}{2} + \dots + \frac{\delta^\tau}{2} + \frac{\delta^{\tau+1}}{3(1 - \delta)}$$

$$= \frac{\delta}{2} \left(\frac{1 - \delta^{\tau+1}}{1 - \delta} \right) + \frac{\delta^{\tau+1}}{3(1 - \delta)}$$

The agenda setter can preclude a censure motion if and only if

$$\hat{b}_j^i \geq 1 - x_k - \frac{\delta}{3(1 - \delta)} + \delta v^c(\tau)$$

$$= 1 - x_k - \frac{\delta}{6} \left(\frac{1 - \delta^{\tau+1}}{1 - \delta} \right) \quad (20a)$$

The agenda setter will preclude a censure motion rather than terminate if and only if

$$1 - \hat{b}_j^i + \frac{\delta}{2} \left(\frac{1 - \delta^{\tau+1}}{1 - \delta} \right) + \frac{\delta^{\tau+1}}{3(1 - \delta)} \geq x_i + \frac{\delta}{3(1 - \delta)},$$

or

$$x_i - x_k \leq \frac{\delta - \delta^\tau}{3(1 - \delta)} \quad (22a)$$

This condition is satisfied for all $x \in X$ if and only if the right-hand side of equation 22a is at least one. Let $\hat{\delta}(\tau)$ satisfy this condition as an equality, or

$$1 = \frac{\hat{\delta}(\tau) - \hat{\delta}(\tau)^\tau}{3(1 - \hat{\delta}(\tau))} \quad (24)$$

For $1 > \delta \geq \hat{\delta}(\tau)$, government dissolution will not occur with τ periods remaining before the next required election. A solution $\hat{\delta}(\tau) < 1$ to equation 24 exists only if $\tau > 4$, and that solution is strictly decreasing in τ with a limit of $\frac{3}{4}$, which is the bound characterized above using equation 22 for a censure procedure with no required election. Table 2 presents values of $\hat{\delta}(\tau)$. To interpret the table, consider a parliamentary system characterized by $\delta = 0.8$, and suppose that $\tau = 10$. Since $\delta > \hat{\delta}(10) = 0.7678$, the condition in equation 22a is satisfied, so the probability of termination in the current period is zero. This is also the case for $\tau = 9$ and $\tau = 8$, but for $\tau = 7$ the probability is positive. As τ decreases, the probability of termination increases until $\tau = 4$.

The probability of termination viewed as a function of τ may be interpreted as a strategic hazard rate, defined by

$$h(\tau) = \Pr \left\{ x \in X \mid x_i - x_k > 2\delta \left(v^c(\tau - 1) - \frac{1}{3(1 - \delta)} \right) \right\} \in \left[0, \frac{1}{2} \right]$$

For $\tau = 1$, $v^c(1) = 1/(3(1 - \delta))$, so $h(1) = \frac{1}{2}$ for all δ . For $\tau = 2$, $v^c(2) = \frac{1}{12} + \delta v^c(1)$, and $h(2) = \frac{1}{2} - \frac{\delta}{6} + \delta^2/72$. For example, if $\delta = 0.8$, $h(2) = 0.3756$. For τ such that $h(\tau) > 0$, the continuation value $v^c(\tau)$ for a member of government is less than $v^M = 1/(2(1 - \delta))$.

This characterization provides two predictions for

TABLE 2. Bound on δ

parliamentary governments. First, voluntary dissolution can occur as a result of the approaching required election. A government is thus more likely to call an early election when the present is more important relative to the future and as a scheduled election draws closer. Voluntary dissolution occurs, however, only when the economic prospects (x_i) of the constituents of the agenda setter are good. Second, the hazard rate increases as the required election approaches. King et al. (1990) found that although the probability of government termination decreases over time, it increases at approximately a year before a required election. Beyond that point there may be little reason to call an early election.

The hazard rate estimated in the empirical literature is based on the time since government formation, but the model considered here indicates that the strategically relevant measure is the number of periods remaining before the next required election. Moreover, the strategic hazard rate is not constant; it increases as a required election approaches.²⁹

CONCLUSION

Parliamentary systems differ in their institutions, and those differences provide a basis for comparison. In the model considered here, that comparison supplements studies which focus on differences in voter preferences, history, and culture. This model of parliamentary government incorporates government formation, legislation, and the possibility of government reorganization or dissolution. It focuses on distributive politics, that is, government spending or income redistribution. Consistent with the empirical literature, it incorporates attributes of the political system in the form of parliamentary procedures for terminating a government, events that may or may not be critical for termination, and strategies of both the government and opposition parties in responding to those events.

The model is formulated to make government stability difficult, but governments are stable when the future is important relative to the present. This stability results not from party alignments or continuity based on past coalitions. Instead, it originates in the parliamentary institution. The installation of a government through majority support in the parliament is accompanied by a substantial degree of agenda control, and this control allows the government to serve the constituents of coalition members. The prospect of continued agenda control provides an incentive to preserve the government.

A majority confidence procedure is effective in preserving a government, since a government member prefers to retain agenda control for all events that may occur. Voting cohesion, however, may erode for extreme events in which the agenda setter seeks the support of the out party on legislation. Moreover,

cohesion is lower, the larger the number of parties in parliament. Challenges to this agenda control through censure motions by the opposition can result in instability and government dissolution, however. Changes in government and the weakening of voting cohesion also result if the parties or their leaders are politically impatient, since the incentive to pursue current opportunities created by the events is then stronger. Government dissolution thus results under two types of conditions. First, challenges by the opposition in the form of a censure or no-confidence motion can force the government to terminate in anticipation of a defeat on the motion. Second, termination can also result from fluctuations in aggregate income. In both cases termination occurs in good rather than bad times for the constituents of the agenda setter, and thus in bad times for the government partner and out party.

The model also provides a formal characterization of critical events. An event is critical if it leads to a change in government or a breakdown in voting cohesion. A critical event is extreme, and the set of critical events depends on the political patience of the parties. The greater the impatience, the larger is the set of potentially critical events and hence the less stable or cohesive is the government. A hazard rate of government termination is also endogenously derived. It varies with the confidence or censure procedure, but it is constant for each party in the absence of required elections. During a constitutional interelection period, the hazard rate increases as a required election approaches. The causal relationship between the hazard rate and government continuation thus does not hinge on time in office but on the time until the next election.

The government that forms in an organization period consists of a minimal majority of the parties. This results from three factors. First, only majority support is required to install a government. Second, the majoritarian incentive to redistribute income among as few coalition partners as possible implies that the formateur prefers to share agenda control with as few others as possible. Consequently, a consensus or surplus government never forms. Third, other parties will not support a minority government because they have an interest in sharing control of the agenda. If the probability of being the agenda setter in a legislative period is proportional to a party's seat share in the government coalition, the formateur forms a party with the smaller of the other two parties. A minority government can form during an organization period if there is no income, since the other parties want to form a government quickly to avoid continued loss of income.

The theory has a number of implications for the empirical study of parliamentary governments. First, the nature and ease of use of confidence and censure procedures affects legislation as well as government stability and cohesion, and thus they should be included in empirical studies. Second, the probability of government termination depends on other institutional features, such as the constitutional interelection pe-

²⁹ This observation is also made by Diermeier and Stevenson (1996).

riod, and in the context of distributive politics the hazard rate increases as a required election approaches. Third, the importance of future considerations, such as a required election, for a current government depends on the political discount factor, and greater political impatience implies lower government stability and cohesion and a broader redistribution of income or government spending. Fourth, events and the ability of a government to adjust to them affect stability, cohesion, and income redistribution. Critical events are extreme and provide temptation as well as threats from the opposition. The set of critical events depends on the form of the confidence and censure procedures as well as on the political discount factor. Fifth, government termination or the calling of an early election can result from fluctuations in aggregate economic activity. In a stable economy, termination is the result of challenges by the opposition. In a volatile economy, termination also can occur voluntarily when times are good for the agenda setter. Sixth, with an organizational process similar to that in the model, only minimal majority governments form. Moreover, the formateur has an incentive to form a coalition with the smaller of the other parties if legislative agenda control is a function of seat shares in the coalition. Minority governments can form with other organizational processes. Other attributes of the political system, such as party configuration and polarization, and institutional features, such as the electoral system, also affect outcomes, and hence the empirical study of parliamentary governments and their termination should be set in the broader context of parliamentary systems.

Cohesion in Legislatures and the Vote of Confidence Procedure

DANIEL DIERMEIER and TIMOTHY J. FEDDERSEN *Northwestern University*

We present a framework to analyze the effects of constitutional features on legislative voting with respect to cohesion and the distribution of payoffs. We then apply this framework to parliamentary democracies and show how a prominent feature of decision making in parliaments, the vote of confidence procedure, creates an incentive for ruling coalitions to vote together on policy issues that might otherwise split them. The key feature that creates cohesive voting is the fact that votes on bills are treated as votes on who controls floor access in future periods. As a consequence, legislative majorities capture more of the legislative rents from the minority in parliamentary democracies than in nonparliamentary settings.

A central difference in legislative behavior between the U.S. Congress and parliamentary systems is the difference in voting cohesion. Members of parliamentary coalitions persistently vote together on different policy issues, while coalitions in the U.S. Congress are issue specific, change frequently, and often cross party lines (e.g., Collie 1985; Loewenberg and Patterson 1979; Mezey 1979; von Beyme 1985).¹ A common explanation for cohesion is that legislators have very similar preferences regarding policy issues. The question is why this is the case in parliamentary democracies but not in the U.S. Congress.

There are various possible answers. One obvious candidate is that political parties are stronger in parliamentary democracies than in the U.S. Congress. Parties in parliamentary democracies often control the nomination or deselection of candidates and therefore can provide incentives for legislators to vote according to the party line. Indeed, voting cohesion in legislatures has often been used as a measure of party strength (e.g., Collie 1985).

Party strength may explain cohesion among members of the same party, but it cannot account for the cohesion observed in multiparty settings. In parliamentary democracies cohesion *across parties* is significantly higher than the level of cohesion among members of *the same party* in the U.S. Congress (Loewenberg and Patterson 1979; Mezey 1979; Von Beyme 1985). So, while a party-based theory of cohesion may be able to account for differences in cohesion between the British House of Commons and the U.S. Congress, it cannot explain why the members of the governing coalition in the German Bundestag (comprised of two parties) vote

more cohesively than, say, members of the Republican Party in the U.S. Congress.

This suggests an institutional explanation for voting cohesion that relies on the incentives created by the characteristic features of parliamentary constitutions. Such features include cabinet government, the ability of the prime minister to call for early elections, the vote of no confidence, and extralegislative bargaining mechanisms (Epstein 1964). In this article we provide a game-theoretic explanation for cohesion that focuses on one of the most prominent institutional features of parliamentary democracies: the vote of confidence procedure. The confidence procedure allows a ruling coalition to propose a bill without allowing amendments and to link the adoption of the bill with the survival of the coalition (Huber 1996).² It thus creates an incentive for all those who profit from the current government to vote for the government's proposals.

In order to develop a formal model of cohesive voting under a vote of confidence procedure, we need a model with two features. First, it must include a series of legislative proposals and votes. Second, it must capture the consequences of rejecting a bill with a confidence motion attached. The basic structure of our model is similar to the well-known legislative bargaining model of Baron and Ferejohn (1989) and the proposer model of Romer and Rosenthal (1978). In these frameworks a legislator makes a proposal that is accepted if and only if a majority of the legislators vote in favor. Otherwise, players receive a reservation value. As these models demonstrate, proposal rights are valuable, since they allow the proposer to extract benefits from other legislators.

In all legislatures some members enjoy special procedural prerogatives. In the U.S. Congress the Speaker and other party leaders along with the committee chairs have considerable control over the legislative agenda by using gate-keeping authority, closed rules, and the right to offer counteramendments. In parliamentary systems, while committees are relatively weak (Lees and Shaw 1979), cabinet members have impor-

All errors are our own.

¹ This regularity holds even after the Republican Party captured the majority in the U.S. Congress (Snyder and Groseclose 1997).

² While confidence procedures are typically authorized by the constitution, they also may be used by convention. In the case of Great Britain, for instance, constitutional scholars generally agree that votes of confidence are binding. Defeat of a motion of confidence has been treated as fatal since 1832 (e.g., Brazier 1988). Huber (1996, Table 1) gives a detailed overview of confidence procedures in 18 countries.

FIGURE 1. Legislative Bargaining without the Confidence Procedure

tant proposal rights (Doering 1995). In this respect congressional leadership and ministers in parliamentary democracies are functional equivalents (Bagehot [1867] 1963; Cooper 1988; Gilligan and Krehbiel 1987; Rogowski 1990).

Legislatures are fundamentally majoritarian institutions. Any special prerogatives enjoyed by some members must ultimately be approved by a chamber majority. Thus, in our model there are two types of voting: voting on bills and voting on who is entitled to propose bills. We call a *ruling coalition* the set of legislators who have a positive probability of being recognized to make a proposal and a *policy coalition* the set of legislators who vote for a bill.

Our model demonstrates how the vote of confidence procedure makes members of the ruling coalition cheaper to include in policy coalitions than they would be otherwise. The confidence procedure creates a link between voting on a bill and voting on the ruling coalition. Since membership in the ruling coalition is valuable in future periods (it allows the capture of future rents by exploiting proposal power), members of the ruling coalition stand to lose from the rejection of a proposal. Legislators who are not in the ruling coalition gain by defeating a bill with the confidence procedure attached because they may be part of a new ruling coalition. This in turn means that in any given period a selected proposer has to offer less to ruling coalition members to gain their support for a policy proposal; members of the ruling coalition are "cheaper." Consequently, they are included in policy coalitions, whereas legislators who are not in the ruling coalition are excluded from policy coalitions. The result is that the vote of confidence not only creates cohesive voting but also allows ruling coalitions to capture more of the distributive benefits from the legislative process.

In the next section we introduce our formal model. We then discuss our results in the context of a simple example. In the penultimate part of the article we discuss some implications of our results for the com-

parative study of legislatures. This is followed by a brief conclusion. Proofs of our results can be found in the Appendix.

THE MODEL

We assume there are n legislators ($n \geq 3$ and n odd) who engage in T periods of legislative bargaining. Let L denote the set of legislators and Λ the set of nonempty subsets of L . In our model there are two types of bargaining: over the distribution of a resource and over who will be able to propose alternative distributions. Bargaining over proposal rights occurs in *organizational periods*, while bargaining over resources occurs in *policy periods*. In organizational periods a legislator is selected at random and proposes a *ruling coalition*. In policy periods a legislator is selected at random from the ruling coalition and proposes a *bill*.

To analyze the effect of the confidence procedure we study two games. The first game, labeled $\Gamma_{\sim con}$, is used to establish a baseline for legislative bargaining without the confidence procedure. The second game corresponds to a legislature with the confidence procedure and is labeled Γ_{con} . In both games the first period is an organizational period. Subsequent periods are also organizational periods unless and until a majority votes to accept a proposed ruling coalition. Once a ruling coalition is approved, the next period is a policy period. If a majority of the legislature votes to accept the proposal in a policy period, then the next period is also a policy period in which the proposer is selected from the same ruling coalition.

The difference between the games occurs when a bill is rejected. In Γ_{con} , if a bill is rejected, then the next period is an organizational period, whereas in $\Gamma_{\sim con}$ the next period is a policy period. Thus, the confidence procedure links the fate of a bill to the fate of the ruling coalition. The structure of the two games is shown in figures 1 and 2.

The history of play prior to each period t determines a subset of legislators whose members may be recog-

FIGURE 2. Legislative Bargaining with the Confidence Procedure

nized to make a proposal. In organizational periods, the set of potential proposers is simply the entire set of legislators; in policy periods, proposers are drawn from the ruling coalition.

Our first assumption requires that each legislator is equally likely to be chosen to make a proposal in organizational periods and that all members of a ruling coalition are equally likely to be chosen to make proposals in policy periods. This rules out proposals in organizational periods that give higher recognition probabilities to some members of the ruling coalition.

ASSUMPTION 1. Let $C \in \Lambda$ be the set of legislators who may be recognized to make a proposal in period t . The probability legislator j is the proposer in period t is $1/|C|$ if $j \in C$, 0 otherwise.

In every period legislators receive a payoff $x \in X$, where X is the set of possible distributions of a dollar among the n legislators, that is, $X \equiv \{x \in [0, 1]^n, \text{ such that } \sum_{i=1}^n x_i = 1\}$. The assumption that a dollar is divided in every period implies that our model of legislative bargaining is distributional. While distributional concerns are clearly important in real-world legislative settings, we make this assumption to rule out policy coalitions based on preference similarity. This guarantees that cohesive voting will be entirely a consequence of institutional features. In organizational periods the period payoff to any legislator, $i \in L$, is simply $1/n$, whereas in policy periods the period payoff is either $1/n$ if the proposal $b \in X$ is rejected or b_i if it is accepted.

To model cohesive voting it is necessary to have a series of votes on different issues in which legislators' preferences change according to the issue. For example, in the U.S. House on some issues liberal Democrats may have common interests with conservative Republicans (e.g., NAFTA); on other issues, such as spending on education, preferences may largely follow

party lines. The effect of issue-specific policy preferences is that, from the perspective of a proposer, the set of legislators whose votes are easiest to obtain changes from issue to issue. We capture issue-specific preferences in a very stylized way. In a distributive politics setting, proposers have an incentive to offer positive benefits only to those legislators who are cheapest. We model changes in issue-specific preferences by assuming that in every period the proposer is endowed with a strict preference order over the other legislators.³

Formally, we assume that in every period nature chooses a strict preference order for legislator j , denoted by P_j , that is defined over the remaining set of legislators $L \setminus \{j\}$. For every $j \in L$, let $\mathcal{R}_j$ be the set of strict preference orders over the legislators in $L \setminus \{j\}$. What remains to be specified is how issue-specific preferences are incorporated in the divide-the-dollar setting. For technical convenience we assume lexicographic preferences.⁴ The preference order combined with the following assumption ensures that proposers are never indifferent among the set of proposals available to them.

³ Alternatively, we could model issue-specific preferences by assuming that nature draws a new reservation value for each legislator in every period. Each draw of reservation values creates an order over the set of legislators for the proposer from those most inclined to vote for a change in the status quo policy to those least inclined. It is thus sufficient to stipulate directly an ordering over legislators, P_j , for the proposer in each period. An advantage of this approach is that the interpretation of the model does not depend on any specific assumption about legislators' issue-specific preferences. Legislators may care about policy outcomes, distributive benefits, or the probability of winning, as long as any such preferences lead to a strict ordering over the set of legislators.

⁴ The assumption of lexicographic preferences for proposers is made for analytical convenience and does not substantively change our results. See Diermeier and Feddersen (1996) for a similar model with nonlexicographic preferences.

ASSUMPTION 2. Each legislator $j \in L$ with preference order P_j lexicographically prefers to make a proposal that is accepted by legislator k to one that is accepted by legislator k' if and only if kP_jk' .

Our theory seeks to provide an explanation for cohesion based on the institutional characteristics of parliamentary democracies and not on persistent preference-based alignments of interests. We therefore assume that every preference order is ex ante equally probable. Issue-specific coalitions are thus likely to change from period to period.

ASSUMPTION 3. In each period t and for every $j \in L$ the probability nature chooses $P_j \in \mathcal{R}_j$ is $1/|\mathcal{R}_j|$.

We now define voting and proposing strategies in each type of period. In an organizational period t , nature chooses a proposer $j \in L$ and preference order P_j . Proposer j learns her preferences over the other legislators along with the history of play and proposes a ruling coalition $C \in \Lambda$. Let H^t be the set of histories up to period t . A proposer's strategy is defined as $C : \mathcal{R}_j \times H^t \rightarrow \Lambda$. All the legislators observe proposer j 's preferences along with the proposed ruling coalition and the history of play and then vote to accept or reject the proposal. A pure voting strategy for legislator i in organizational period t is defined as $z_i : \mathcal{R}_j \times \Lambda \times H^t \rightarrow \{A, R\}$, where A indicates a vote to accept the proposed coalition, and R indicates a vote to reject. A proposed ruling coalition is accepted if and only if a majority of the legislators vote to accept.

In a policy period t , nature selects a proposer j from the ruling coalition and, as in an organizational period, a preference order P_j . The proposer j learns her preferences, P_j , the history of play, h^t , and proposes a bill. A strategy for j is defined as a bill, $b : \mathcal{R}_j \times H^t \rightarrow X$. The legislators observe proposer j 's preferences along with the proposed bill as well as the history of play prior to period t and then vote to accept or reject the proposal. A voting strategy for legislator i in policy period t is defined as $w_i : \mathcal{R}_j \times X \times H^t \rightarrow \{A, R\}$, where A indicates a vote to accept the proposed bill, and R indicates a vote to reject. The bill is accepted if a majority votes to accept and is rejected otherwise.

Our final assumption is standard in legislative voting games (Baron and Ferejohn 1989).

ASSUMPTION 4. All legislators have a lexicographical preference for voting to accept a proposal.

Given that players have strict preferences over voting and proposal strategies, it is without loss of generality to consider pure strategies and use the iterated elimination of strictly dominated strategies to solve both games.

RESULTS

The logic of our results is easy to see within a fairly simple two-period three-legislator example. We will use this example to illustrate each of the results and then give the general result for the n -legislator and

T -period model. The proofs for the general results may be found in the Appendix.

Consider a three-person legislature, $L = \{1, 2, 3\}$. If the last period is an organizational period, then legislators cannot make redistributive proposals, and each legislator receives a period payoff of $1/3$. Suppose that the last period is a policy period, and legislator $i \in L$ with preference order P_i is chosen to propose a division of a dollar among the legislators. If the proposal is accepted by a majority, then each legislator receives his or her proposed share. Otherwise, each receives $1/3$.

By assumption 4, every legislator strictly prefers to accept any proposal that provides her with at least $1/3$ of the dollar. It follows by the elimination of strictly dominated strategies that any proposal which offers at least $1/3$ to at least one other legislator will be accepted, while all other proposals will be rejected. The proposer will thus allocate $1/3$ to exactly one other legislator. There are two such proposals. Assumption 2 implies that legislator i 's preference order, P_i , determines a unique best proposal in which she offers $1/3$ to her preferred coalition partner and keeps $2/3$ for herself. The proposer and the legislator who is offered $1/3$ will vote to accept the proposal, while the legislator who is offered 0 will vote to reject. Thus, if legislator 1 is the proposer and she prefers legislator 2 to legislator 3, then she has a strictly dominant strategy to offer $1/3$ to legislator 2 and 0 to legislator 3.

It is now a simple matter to calculate the expected value to each legislator for the last period. Let C be the ruling coalition in the last period and $c = |C|$ be the size of the ruling coalition, where $c \in \{1, 2, 3\}$. It follows from assumption 3 that the expected last-period payoff for legislators who are not in the ruling coalition is simply $1/6$, that is, half the time they are in the proposer's preferred coalition and receive $1/3$, otherwise they receive 0. The expected continuation value for the members of the ruling coalition is slightly more complicated. By assumption 1, each member of the ruling coalition has probability $1/c$ of being recognized to make a proposal. Conditional on not being the proposer, the expected last-period payoff is the same for members of the ruling coalition as it is for nonmembers. Thus, the expected continuation value for members of the ruling coalition is given by:

$$\frac{1}{c} \frac{2}{3} + \left[1 - \frac{1}{c} \right] \frac{1}{6} = \frac{1}{6} + \frac{1}{2c}.$$

It follows that members of the ruling coalition receive more in expectation than nonmembers, but all legislators expect to receive some part of the dollar.

Lemma 1 below shows that each legislator's expected last-period payoff is identical in both games and depends only on the size of the ruling coalition and whether the legislator is a member of it. For notational convenience, periods are labeled in backward order, that is, the final period is period 1, while the first period is period T . We denote the set of proposers given history h^t by $C(h^t)$. So, if h^t is an organizational period, we have $C(h^t) = L$, while for policy periods $C(h^t)$

corresponds to the ruling coalition. For any history h^t , the expected payoff prior to period t for any $i \in L$ is denoted $v_i(h^t)$.

LEMMA 1. In either game Γ_{con} or $\Gamma_{\sim con}$ and for any history $h^t \in H^t$ and legislator $i \in L$, $v_i(h^t)$ equals

$$v_i(h^t) = \begin{cases} \frac{1}{2n} & \text{if } i \notin C(h^t), \\ \frac{1}{2c} + \frac{1}{2n} & \text{otherwise,} \end{cases}$$

where $c = |C(h^t)|$.

Proof. See the Appendix.

We call the set of legislators who vote in favor of a policy proposal a *policy coalition* and say that voting is *cohesive* in two policy periods if the policy coalitions are the same in each period. Proposition 1 shows that in the game without the confidence procedure in any two policy periods, voting will be cohesive with probability strictly less than one, and this probability goes to zero as the size of the legislature increases. Furthermore, the average policy period payoff for coalition members is strictly greater than for noncoalition members.

To see this in the case of the three-legislator example, consider voting and proposing behavior in the penultimate period. Suppose this is an organizational period in which legislator $i \in L$ with preference order P_i is chosen to propose a ruling coalition. It follows from assumption 4 and the continuation values described above ($1/6 + 1/2c \geq 1/3 > 1/6$) that it is a strictly dominant strategy for a legislator to vote for any coalition in which she is included and to vote against otherwise. Thus, only coalitions that are minimum winning or greater will be approved by a majority. The iterated elimination of strictly dominated strategies implies that proposer i will propose a minimum winning coalition of herself and her preferred coalition partner under P_i , and this coalition will be approved. This will also be the case in the n legislator game with and without the confidence procedure.

Suppose that the penultimate period is a policy period with ruling coalition $C = \{1, 2\}$. Lemma 1 demonstrates that voting and proposing behavior in the final period are independent of behavior in the penultimate policy period. It follows that voting and proposing behavior in that period is the same as in the last period. The expected payoff for the last two periods for each member of the ruling coalition is simply $2 \times 5/12 = 5/6$, whereas for legislator 3 it is $2 \times 1/6 = 1/3$. Cohesion occurs when the policy coalitions are the same in the penultimate and last periods. Three policy coalitions may occur: $\{1, 2\}$, $\{1, 3\}$, and $\{2, 3\}$. In each period, coalition $\{1, 2\}$ occurs with probability .5, while the other two coalitions occur with probability .25. It is easy to see that cohesive voting occurs with probability $3/8$.

PROPOSITION 1. If $T \geq 2$, then the following statements are true in $\Gamma_{\sim con}$: (i) in the first period, $t = T$, a minimum winning coalition is proposed and accepted; (ii) voting

is cohesive in any pair of policy periods t and t' with probability

$$\frac{\left(\frac{n-1}{2}\right)! \left(\frac{n-1}{2}\right)!}{(n-1)!} \sum_{k=1}^{n+1} \frac{k}{n+1} \frac{\left(\frac{n-1}{2}\right)! \left(\frac{n-1}{2} - k\right)!}{\left(\frac{n-1}{2}\right)!} \frac{\left(\frac{n-1}{2}\right)! \left(\frac{n-1}{2} - j\right)!}{\left(\frac{n-1}{2}\right)!} < \frac{\left(\frac{n-1}{2}\right)! \left(\frac{n-1}{2}\right)!}{(n-1)!};$$

and (iii) the average policy period payoff for any member of the ruling coalition is

$$\left(\frac{1}{n+1} + \frac{1}{2n}\right),$$

and for nonmembers it is

$$\left(\frac{1}{2n}\right).$$

Proposition 2 below shows that the addition of the confidence procedure does not change the incentives for forming minimum-winning ruling coalitions in organizational periods, but it does increase the probability of cohesive voting and results in the ruling coalition capturing almost all the distributive benefits. In Γ_{con} the fate of a policy proposal and the ruling coalition are linked because an organizational period follows any policy period in which a bill is rejected. In the three-person legislature this implies that a rejection of the proposal in the penultimate period gives every legislator her reservation value in both periods, that is, $2/3$. Thus, in the penultimate period it is a strictly dominant strategy for any member of the ruling coalition to vote for any proposal in which she receives at least $2/3 - 5/12 = 1/4$. Legislator 3, however, is more expensive, since she will only vote for the bill if the proposal offers her at least $2/3 - 1/6 = 1/2$.

The confidence procedure makes it a strictly dominant strategy for proposers to offer $1/4$ to their coalition partner and keep $3/4$ for themselves. It follows that the policy coalition in the penultimate period will always be the same as the ruling coalition, and cohesion occurs with probability $1/2$. Cohesive voting is thus more likely with the confidence procedure than without. It is easy to see that by increasing the number of periods of legislative bargaining the expected value of future proposal rights is strictly increasing, with the consequence that members of the ruling coalition have an even greater incentive to vote together. As Proposition 2 demonstrates, this implies cohesive voting with probability 1 in any pair of policy periods that does not include the last period.

PROPOSITION 2. If $T \geq 2$, then the following statements are true in the game Γ_{con} : (i) in the first period, $t = T$, a minimum winning coalition is proposed and accepted; (ii) in any pair of policy periods, τ and τ' , such that $\tau, \tau' \geq 2$, voting behavior satisfies cohesion with probability 1; and (iii) the average period payoff for any member of the ruling coalition in policy period t is

$$\frac{(t-1) \frac{2}{n+1} + \left(\frac{1}{n+1} + \frac{1}{2n} \right)}{t},$$

and for nonmembers it is

$$\frac{\frac{1}{n} + \frac{1}{2n}}{t}.$$

The next corollary illustrates that resources are divided more evenly without the confidence procedure than with it. Indeed, the average period payoff for legislators who are not in the ruling coalition goes to 0 in game Γ_{con} as the number of periods gets large.

COROLLARY 1. In game Γ_{con} , $\lim_{t \rightarrow \infty} v_i(h^t)/t = 1/c$ for any $i \in C$, and $\lim_{t \rightarrow \infty} v_i(h^t)/t = 0$ for any $i \notin C$, whereas in $\Gamma_{\sim con}$, $\lim_{t \rightarrow \infty} v_i(h^t)/t = 1/(n+1) + 1/(2n)$ for any $i \in C$, and $\lim_{t \rightarrow \infty} v_i(h^t)/t = 1/(2n)$ for any $i \notin C$.

Despite the striking distributional effects of the confidence procedure, it is the case in both models that members of the ruling coalition are strictly better off by maintaining the ruling coalition than by making the next period an organizational period. Moreover, this incentive increases in the number of periods remaining.

Our model also implies higher variance in the level of cohesion in legislatures without the confidence procedure than in parliamentary democracies, but lower average levels of cohesion. Previous research on the U.S. Congress, for instance, indicates considerable variation in cohesion (Brady, Cooper, and Hurley 1979; Collie 1985; Cox and McCubbins 1993; Rohde 1991; Snyder and Groseclose 1997).

One concern that readers may have with the model is that the vote of confidence procedure is rarely formally attached to bills in parliamentary democracies. This raises the question of how the confidence procedure can explain cohesion. Yet, simply the threat of the confidence procedure may be sufficient to generate the behavior described above. Consider the following modification to the game with the confidence procedure. In every policy period a member of the ruling coalition is recognized to propose a bill. Next, the legislature votes on the bill. If a majority votes in favor, then the bill is accepted, and the next period is a policy period. If the bill is rejected, then the same bill is automatically reintroduced with a confidence motion attached. Suppose further that there is small error probability in voting decisions. This implies that bills with a confidence procedure are accepted with positive probability and rejected with positive probability. As in Γ_{con} , when the bill with the confidence motion attached is de-

feated, the next period is an organizational period. Since the only difference between accepting the bill without the confidence motion and rejecting it occurs in the event that the bill with the confidence procedure is rejected, voting and proposing behavior will be identical to the behavior in Γ_{con} .

IMPLICATIONS

The main purpose of our article is to develop a dynamic model of coalition formation and voting that provides an institutional explanation of cohesive voting. Our results demonstrate that the ability of legislators to attach a vote of confidence procedure to a bill is sufficient to generate cohesion. The analysis suggests a variety of additional implications for the comparative study of legislatures.

Cohesion Dynamics

Corollary 1 demonstrates that the value of belonging to the ruling coalition steadily increases in the number of periods left for ruling coalition members but decreases for other legislators. To see the potential consequences of this, consider a variant of our model in which per-period preferences are subject to potentially large random shocks.⁵ When the number of remaining periods is large, it takes larger shocks both to upset cohesive voting and to cause a bill to fail than when there are only a few periods left. This suggests that, given identical, independently distributed (i.i.d.) shocks, we should see cohesive voting decline as the next mandated election approaches, while the conditional probability of cabinet termination would be expected to increase toward the end of a legislative session. This is consistent with Warwick's (1992) finding of increasing hazard rates for parliamentary governments.

Votes of Censure, Constructive Vote of No Confidence, Votes of Investiture

One of the most frequently mentioned differences between parliamentary and presidential democracies is the fact that the ruling coalition is elected by the chamber and can be voted out of office by a supporting majority at any time.⁶ In our model this election corresponds to a choice of ruling coalitions, while votes of censure correspond to a transition from a bill period to an organizational period. Notice, however, that *in this sense* presidential and parliamentary systems are very similar. A collapse of the government (in the precise sense of a ruling coalition) in a parliamentary system is functionally equivalent to changing the orga-

⁵ Random shocks could be incorporated into a model with random reservation values as in an earlier version of this article (Diermeier and Feddersen 1996). See also Baron 1998.

⁶ See Bagehot ([1867] 1963): "The House of Commons is an electoral chamber; it is the assembly which chooses our president" (p. 115), and "the principle of Parliament is obedience to leaders. Change your leaders if you will, but obey No. 1 while you serve No. 1, and obey No. 2 when you have gone over to No. 2" (p. 125).

nizational structure of Congress. Corollary 1 establishes that in both systems supporting coalitions have a strict incentive to maintain the current ruling coalition. The fact that the government is accountable to parliament is not sufficient to guarantee cohesive voting.⁷ Rather, what matters is whether accountability is linked to voting on policy proposals.

Party Strength

As mentioned in the introduction, political parties may be able to exert influence over the voting behavior of their members in a variety of ways leading to cohesive voting. A party-based explanation of cohesion leaves open the question of why, for instance, strong parties evolved in Great Britain but not in the United States, given that both countries elect the representatives to their lower chamber by first-past-the-post rules. Cox (1987) has pointed out that the development of disciplined electoral parties was preceded by higher levels of cohesive voting in the House of Commons. This suggests that changes in the legislative system (such as the rise in power of Commons during the nineteenth century) may have encouraged the formation of disciplined parties. To see how this might work, consider the Cox and McCubbins (1993) approach to parties. In their approach, parties provide a collective good to legislators, a brand label, that provides information to risk-averse voters and thus increases reelection probabilities. Yet, legislators also have an incentive to maintain individual reputations. Maintaining the brand label thus creates a collective action problem. Parties are viewed as self-enforcing mechanisms that solve this problem by providing selective incentives to legislators. Corollary 1 implies that the expected payoff difference between being a member of the majority and the minority is always strictly higher in parliamentary systems, thus providing stronger incentives to maintain a collective reputation.

France's Fourth Republic

The formal analysis has shown that confidence vote procedures are sufficient for cohesion, but are they necessary? The discussion of strong political parties above indicates that they are not necessary in the case of one majority party. But some empirical evidence suggests the necessity of the confidence procedure in the case of multiparty legislatures in which no party holds a majority of seats. The French Fourth Republic is a notorious puzzle for the comparative study of legislatures. Although it seemingly fulfilled all constitutional prerequisites for a stable parliamentary de-

mocracy, it was plagued (among other things) by low levels of cohesion. Our result suggests that the details of the vote of confidence procedure should be investigated to find out whether they force the government to step down in case of defeat.

While the French Fourth Republic did have a vote of confidence procedure, Huber (1996) recently pointed out that it was deficient in a critical way: Abstentions counted against the bill but for the government. Thus, through the strategic use of abstentions, legislators could vote down the bill but avoid the resignation of the government. Hence, a vote on a bill could not be linked to the survival of the government. This example emphasizes that the vote of confidence procedure is an instrument of the government that forces legislators to support the cabinet. The strategic use of abstention in the French Fourth Republic, however, allowed the legislators to untie these knots and only vote on the bill. In this case, our model predicts low cohesion.

Internal Organization of Legislatures

Another significant difference between parliamentary systems and the U.S. Congress occurs on the dimension of legislative organization. In parliamentary systems, legislative bargaining is mainly conducted by government party leaders and ministers. In contrast, bargaining occurs within committees in the U.S. Congress. Only members of the governing coalition are in the cabinet, whereas congressional committees are typically bipartisan, and the minority exercises significant influence. Suppose, following Gilligan and Krehbiel (1987), that committees are understood to provide a collective good in the form of information to the legislature as a whole. In that case there is a greater incentive under a system without the vote of confidence to include members of the minority on the committees. This follows because the minority as well as the majority can expect to gain from better information. The same cannot be said for parliamentary systems. In such systems the vote of confidence procedure permits any informational gains to be entirely exploited by the majority alone, thus reducing the incentive for the minority to contribute any useful information. If the minority is not going to contribute anything by being involved in the policy formation stage, then there is little reason to give it much voice either within the cabinet or on the floor.

Payoff Distributions and the Design of Constitutions

Corollary 1 points out that the design of constitutions may also have consequences for the distribution of expected payoffs among representatives (and thus their constituencies). Ruling coalitions in parliamentary systems capture almost all the spoils, leaving little for the minority. When the vote of confidence procedure is not available, the minority shares in the spoils, although it receives less than the ruling coalition. This result is important in the context of constitutional design, since it points out trade-offs between different goals in

⁷ Some parliamentary democracies, such as Germany and Spain, use constructive votes of no confidence instead of a vote of censure. Under these procedures a government cannot be voted out of office, only replaced by an alternative governing coalition. In our model, this would mean that governing coalitions could be replaced directly without moving to an organizational stage first. Again, corollary 1 suggests that the presence of such an explicit procedure is neither necessary nor sufficient for voting cohesion. For a detailed analysis of different kinds of no-confidence procedures, see Baron 1998.

designing a constitution, for example, between stable and predictable policy coalitions and payoff equity. This is especially important if majorities do not change frequently enough from election to election, as could be expected, for example, if social, political, and economic cleavages coincide (Lijphart 1977). The fact that the majority can so effectively exploit the minority under the vote of confidence procedure suggests an incentive for minorities to seek extralegislative remedies. Minorities might gain leverage by engaging in protest activities that constrain the government. The greater incentive to engage in disruptive activities would lead to greater incentives to set up extralegislative mechanisms to diffuse such crises (Lijphart 1977). Thus, our model may provide some leverage for explaining the greater incidence of extralegislative bargaining mechanisms found more frequently under parliamentary systems.

CONCLUSION

We have developed a model to study the formation of legislative coalitions and voting cohesion in parliamentary and nonparliamentary legislatures. Our framework implies low cohesion in systems without the vote of confidence procedure, such as the United States, and high cohesion in systems with the procedure, such as parliamentary democracies, even if the latter are characterized by many parties. The key feature that leads to cohesion is the fact that votes on bills are treated as votes on who controls floor access in future periods. We identified the vote of confidence procedure as one constitutional feature sufficient for cohesion. The fact that ruling coalitions are accountable to the assembly, however, is neither necessary nor sufficient for cohesion.

If confidence procedures provide distributional benefits to ruling coalitions, then it is natural to ask why a legislative majority would not create an analogous institution in the U.S. Congress. Note, however, that in the absence of constitutional commitment devices, such as the confidence procedure, legislative majorities face a credibility problem. The ruling coalition may threaten to step down if its proposal is defeated, but expect it prefers not to lose its proposal rights, whether the proposed bill passes or not. Rational legislators would thus discount such a threat and vote on their period-specific preferences, which would lead to voting behavior with low levels of voting cohesion.

These commitment problems may be solvable using standard repeated game arguments. In this case, legislative majorities may be able to develop self-enforcing norms that make resignation threats credible. Yet, as the example of the French Fourth Republic and the high variance in cohesion in the U.S. Congress suggest, whether such norms are sustainable in equilibrium may depend on the strategic incentives in a given decision situation. An analysis of the conditions permitting endogenous commitment may be a useful subject of future research.

APPENDIX

It will be convenient to have some notation to denote a proposer's preferred set of coalition partners. We call $L(C, P_j)$ legislator j 's preferred coalition, given $C \in \mathcal{A}$. The set of legislators $L(C, P_j)$ is simply legislator j 's most preferred set of partners in a minimum winning coalition that includes as many members of C as possible. If $|C| \geq (n-1)/2$, $L(C, P_j)$ is the set of $(n-1)/2$ legislators in C (other than j) who are most preferred by j , given P_j . If $|C| < (n-1)/2$, then $L(C, P_j)$ includes all the members of C (other than j) and the $(n-1)/2 - |C|$ most preferred legislators among the remaining legislators.

Suppose, for example, that legislators are numbered $1, \dots, n$, with the proposer 1 having a preference order such that 2 is preferred to 3, 3 to 4, and so on. Then, $L(L, P_1) = \{2, 3, \dots, (n+1)/2\}$. Suppose that $C = \{5, 6, \dots, (n+3)/2\}$. Then, $|C| = (n-1)/2 - 2$, and $L(C, P_1) = \{2, 3, 5, 6, \dots, (n+3)/2\}$, where legislator 4 is left out of 1's preferred coalition, even though according to P_1 , 1 prefers her to all the members C .

LEMMA 1. In either game Γ_{con} or $\Gamma_{\sim con}$ and for any history $h^t \in H^t$ and legislator $i \in L$, $v_i(h^t)$ equals

$$v_i(h^t) = \begin{cases} \frac{1}{2n} & \text{if } i \notin C(h^t), \\ \frac{1}{2c} + \frac{1}{2n} & \text{otherwise,} \end{cases} \quad (1)$$

where $c = |C(h^t)|$.

Proof. If period $t = 1$ is an organizational period, then the period payoff is $1/n$ for every legislator. Equation 1 holds since $C(h^1) = L$, and $c = n$. Suppose period $t = 1$ is a policy period with ruling coalition $C(h^1) \in \mathcal{A}$. It follows from assumption 4 and the fact that each legislator will receive a payoff of $1/n$ if the bill is defeated that it is a strictly dominant strategy for every legislator to vote to accept if and only if the bill offers her at least $1/n$. Thus, a bill will pass if and only if it provides $1/n$ to a majority of the legislators. It follows from assumption 2 and the iterated elimination of dominated strategies that each proposer $j \in C(h^1)$ will offer $1/n$ to the members of her most preferred minimum winning coalition and keep the remainder for herself. Formally, a proposer $j \in C(h^1)$ with preference order P_j will propose

$$b_j(P_j, h^1) = \begin{cases} \frac{n+1}{2n} & \text{if } i = j, \\ \frac{1}{n} & \text{if } i \in L(L, P_j), \\ 0 & \text{otherwise,} \end{cases}$$

for any history $h^1 \in H^1$. Note that every nonproposing legislator will be in the preferred coalition with probability $1/2$. Equation 1 follows immediately as a consequence of assumptions 1 and 3. *Q.E.D.*

PROPOSITION 1. If $T \geq 2$, then the following statements are true in $\Gamma_{\sim con}$: (i) in the first period, $t = T$, a minimum winning coalition is proposed and accepted; (ii) voting is cohesive in any pair of policy periods t and t' with probability

$$\frac{\left(\frac{n-1}{2}\right)! \left(\frac{n-1}{2}\right)!}{(n-1)!} \sum_{k=1}^{\frac{n+1}{2}} \frac{k}{\frac{n+1}{2}} \frac{\left(\frac{n-1}{2}\right)! \left(\frac{n-1}{2}\right)!}{\left(\frac{n-1}{2}\right)!} \frac{\left(\frac{n-1}{2}\right)!}{\left(\frac{n+1}{2}-k\right)!} \frac{\left(\frac{n-1}{2}\right)!}{\left(\frac{n+1}{2}-j\right)!} < \frac{\left(\frac{n-1}{2}\right)! \left(\frac{n-1}{2}\right)!}{(n-1)!};$$

and (iii) the average policy period payoff for any member of the ruling coalition is

$$\left(\frac{1}{n+1} + \frac{1}{2n}\right),$$

and for nonmembers it is

$$\left(\frac{1}{2n}\right).$$

Proof. The proof is by induction. From lemma 1 we know that for period $t = 1$ the following statement holds. For any history h^t in which the set of proposers in period t is $C(h^t)$, the ex ante expected payoff for any $i \in L$ is

$$v_i(h^t) = \begin{cases} t\left(\frac{1}{2c} + \frac{1}{2n}\right) & \text{if } i \in C(h^t), \\ \frac{1}{2n} & \text{if } i \notin C(h^t), \end{cases} \quad (2)$$

where $c = |C(h^t)|$.

Suppose that the induction hypothesis holds for some period $t \geq 1$. Let period $t + 1$ be an organizational period. The expected payoff to every legislator $i \in L$ if a ruling coalition C is proposed and accepted in period $t + 1$ is $1/n + v_i(h^t)$, where $C(h^t) = C$. It follows that legislator i will vote for any coalition C if and only if $i \in C$. Since $v_i(h^t)$ is decreasing in c for members of the ruling coalition, it follows from the iterated elimination of dominated strategies and assumption 2 that the proposer will propose her preferred minimum winning coalition, $C(P_j, h^{t+1}) = L(L, P_j) \cup \{j\}$, and this minimum winning coalition will be accepted. Assumptions 1 and 3 imply that the ex ante expected payoff for every $i \in L$ is independent of the history h^{t+1} and is given by

$$v_i(h^{t+1}) = \frac{t+1}{n}. \quad (3)$$

Suppose period $t + 1$ is a policy period; and the history of play is h^{t+1} . If $C(h^{t+1})$ is the ruling coalition in policy period $t + 1$, then $C(h^t) = C(h^{t+1})$ for any history h^t that is consistent with h^{t+1} . That is, the ruling coalition in period $t + 1$ is also the ruling coalition in policy period t . Suppose a bill b is proposed in period $t + 1$, and let h_a^t be a history consistent with h^{t+1} in which b is accepted and h_n^t in which b is not accepted. The expected payoff to any legislator $i \in L$ if a bill b is accepted is $b_i + v_i(h_a^t)$ and $1/n + v_i(h_n^t)$ if b is rejected. But $v_i(h_a^t) = v_i(h_n^t)$, and $C(h_a^t) = C(h_n^t) = C(h^{t+1})$. It follows that in period $t + 1$ a legislator $i \in L$ will vote for b if and only if $b_i \geq 1/n$. Thus, by the same logic as in lemma 1 it follows that each proposer will propose the bill b such that

$$b_i(P_j, h^{t+1}) = \begin{cases} \frac{n+1}{2n} & \text{if } i = j, \\ \frac{1}{n} & \text{if } i \in L(L, P_j), \\ 0 & \text{otherwise,} \end{cases}$$

and the expected period payoff is

$$v_i^{t+1}(h^{t+1}) = \begin{cases} (t+1) \left(\frac{1}{2c} + \frac{1}{2n}\right) & \text{if } i \in C(h^{t+1}) \\ (t+1) \left(\frac{1}{2n}\right) & \text{if } i \notin C(h^{t+1}). \end{cases} \quad (4)$$

This completes the induction step. In period T a minimum winning coalition C is proposed, and only members of the ruling coalition vote to accept. The same C governs in every policy period, and proposals are always passed by a minimum winning coalition determined only by the identity of the proposer and the proposer's preference order.

To see that claim (ii) in the proposition is correct, let τ and τ' be policy periods. Let S be a policy coalition in period τ , that is, the set of legislators who vote to accept the bill proposed in period τ . By the argument above we know that $|S| = n+1/2$. We also know that the ruling coalition in policy periods τ and τ' is the same in both periods. Denote the ruling coalition by C . We can partition the set of possible policy coalitions in period τ into subsets S_k , where $S_k \equiv \{S \subset L : |S| = (n+1)/2 \text{ and } |S \cap C| = k\}$ and $k \in \{1, 2, \dots, (n+1)/2\}$. In words, S_k is the set of minimum winning coalitions that contain exactly k members of the ruling coalition. Let $\Pr(S \in S_k)$ be the probability that the policy coalition in period τ contains exactly k members of the ruling coalition C . Then,

$$\Pr(S \in S_k) = \frac{g(n, k)}{\sum_{j=1}^{\frac{n+1}{2}} g(n, j)},$$

where

$$g(n, k) = \frac{n+1}{2} \frac{\left(\frac{n-1}{2}\right)!}{\left(\frac{n-1}{2}-k\right)!} \frac{\left(\frac{n-1}{2}\right)! \left(\frac{n-1}{2}\right)!}{(n-1)!}.$$

For any $S \in S_k$ in policy period τ , the probability that the policy coalition in period τ' (S') is the same as S is given by

$$\Pr(S' = S | S \in S_k) = \frac{k}{\frac{n+1}{2}} \frac{\left(\frac{n-1}{2}\right)! \left(\frac{n-1}{2}\right)!}{(n-1)!}.$$

In words, this is the probability that the proposer in period τ' is one of the k members of the ruling coalition in policy coalition S and that the proposer prefers to include the other members of S in her policy coalition. The probability that voting is cohesive in any pair of policy periods is thus

$$f(n) = \sum_{k=1}^{\frac{n+1}{2}} \Pr(S \in S_k) \Pr(S' = S | S \in S_k) = \frac{\left(\frac{n-1}{2}\right)! \left(\frac{n-1}{2}\right)!}{(n-1)!} \sum_{i=1}^{\frac{n+1}{2}} \frac{i}{\frac{n+1}{2}} \Pr(S \in S_k). \quad (5)$$

Since

$$\sum_{i=1}^{\frac{n+1}{2}} \frac{i}{n+1} \Pr(S \in S_k) < 1,$$

it follows that

$$f(n) < \frac{\left(\frac{n-1}{2}\right)! \left(\frac{n-1}{2}\right)!}{(n-1)!}.$$

Statement (iii) follows from equation 2, and $|C(h^t)| = (n+1)/2$ in any policy period t . *Q.E.D.*

PROPOSITION 2. *If $T \geq 2$, the following statements are true in the game Γ_{con} : (i) in the first period, $t = T$, a minimum winning coalition is proposed and accepted; (ii) in any pair of policy periods τ and τ' , such that $\tau, \tau' \geq 2$, voting behavior satisfies cohesion with probability 1; and (iii) the average period payoff for any member of the ruling coalition in policy period t is*

$$\frac{(t-1) \frac{2}{n+1} + \left(\frac{1}{n+1} + \frac{1}{2n}\right)}{t},$$

and for nonmembers it is

$$\frac{\frac{1}{n} + \frac{1}{2n}}{t}.$$

Proof. The proof is by induction. The following statements are true for period $t = 1$ by lemma 1, so suppose that they hold for some period $t \geq 1$. For any history h^t with proposing coalition $C(h^t)$ (where $c = |C(h^t)|$), it is the case that

$$v_i(h^t) = \begin{cases} \frac{t-1}{c} + \left(\frac{1}{2c} + \frac{1}{2n}\right) & \text{if } i \in C(h^t) \text{ and } c \geq \frac{n+1}{2}, \\ \frac{1}{2n} & \text{if } i \notin C(h^t) \text{ and } c \geq \frac{n+1}{2}, \\ v_c^t & \text{if } i \in C(h^t) \text{ and } c < \frac{n+1}{2}, \\ v_n^t & \text{if } i \notin C(h^t) \text{ and } c < \frac{n+1}{2}, \end{cases} \quad (6)$$

where either

$$v_c^t > t/n > v_n^t,$$

or

$$v_c^t = v_n^t = t/n.$$

If period $t+1$ is an organizational period, then an argument analogous to that in proposition 1 shows that a minimum winning coalition will be proposed and accepted, and only legislators included in the proposed ruling coalition will vote to accept.

Suppose $t+1$ is a policy period reached by history h^{t+1} with ruling coalition $C(h^{t+1})$, and let $c = |C(h^{t+1})|$. Suppose that a bill b is proposed in this period, and let h_a^t be a t -period history that is consistent with h^{t+1} , where b is accepted, and h_n^t if b is rejected. In Γ_{con} the expected payoff to every legislator i if b is accepted is $b_i + v_i(h_a^t)$, and $1/n + v_i(h_n^t)$ if b is rejected, where $C(h_a^t) = C(h^{t+1})$, and $C(h_n^t) = L$. From equation 6 we know that $v_i(h_n^t) = t/n$; thus, for any

history h^{t+1} it follows that legislator i will vote for b if and only if $b_i \geq (t+1)/n - v_i(h_a^t)$. If $c \geq (n+1)/2$, then by equation 6, $v_i(h_a^t) \geq t/n$ for any $i \in C(h^{t+1})$, and $v_i(h_n^t) < t/n$ for any $i \notin C(h^{t+1})$. It follows that a proposer will never propose a bill that gives a positive payoff to any $i \notin C$, and

$$v_i(h^{t+1}) = \begin{cases} \frac{t}{c} + \left(\frac{1}{2c} + \frac{1}{2n}\right) & \text{if } i \in C(h^{t+1}), \\ \frac{1}{2n} & \text{if } i \notin C(h^{t+1}). \end{cases} \quad (7)$$

So, for a ruling coalition $C(h^t)$, such that $|C(h^t)| = (n+1)/2$, a legislator votes for the proposal if and only if $i \in C(h^t)$.

If $c < (n+1)/2$, then there are two cases. On the one hand, if $v_c^t = t/n = v_n^t$, then the continuation values cancel, and voting and proposing behavior in period $t+1$ is identical to the behavior in period $t = 1$. It follows that

$$v_i(h^{t+1}) = \begin{cases} \left(\frac{1}{2c} + \frac{1}{2n}\right) + t/n & \text{if } i \in C(h^{t+1}), \\ \frac{1}{2n} + t/n & \text{if } i \notin C(h^{t+1}). \end{cases}$$

Thus, $v_i(h^{t+1}) > (t+1)/n$ for any $i \in C(h^{t+1})$, and $v_i(h^{t+1}) < (t+1)/n$ for any $i \notin C(h^{t+1})$.

On the other hand, suppose $v_c^t > t/n > v_n^t$. Since there are not enough coalition members to pass a bill, any proposal must receive the votes of at least $(n+1)/2 - c$ legislators who are not in the ruling coalition in order to pass. If no bill passes in period $t+1$, then

$$v_i(h^{t+1}) = \frac{t+1}{n}$$

for every $i \in L$. Suppose that a bill passes in period $t+1$. Legislator $i \in L$ will vote for a proposal b if and only if $b_i \geq (t+1)/n - v_i(h_a^t)$. It follows from $v_c^t > v_n^t$ that ruling coalition members are cheaper from the proposer's perspective than are nonmembers. The proposer will offer $(t+1)/n - v_n^t$ to the minimum number $(n+1)/2 - c$ of legislators not in the ruling coalition necessary to ensure passage of the bill. It follows from assumption 3 that

$$v_i(h^{t+1}) = v_n^{t+1} = \left(\frac{n+1}{2} - c\right) \left(\frac{t+1}{n} - v_n^t\right) + v_n^t$$

for any $i \notin C(h^{t+1})$, and

$$v_i(h^{t+1}) = v_c^{t+1} = \frac{1}{c} (t+1 - (n-c)v_n^{t+1})$$

for any $i \in C(h^{t+1})$. Since $t/n > v_n^t$ and $1 > (n+1)/2 - c/n - c > 0$, it follows that $(t+1)/n > v_n^{t+1} > v_n^t$. Similarly,

$$v_c^{t+1} > \frac{1}{c} \left(t+1 - (n-c)\frac{t+1}{n}\right) = \frac{t+1}{n}.$$

Thus, $v_c^{t+1} > (t+1)/n > v_n^{t+1}$.

This completes the induction step. It follows that every period after the first is a policy period, and thus voting is cohesive in every period but the last. Statement (iii) is implied by equation 7. *Q.E.D.*

International Crises and Domestic Politics

ALASTAIR SMITH *Yale University*

Audience costs enable leaders to make credible commitments and to communicate their intentions to their adversaries during a crisis. I explain audience costs by simultaneously modeling crisis behavior and the domestic reelection process. I assume that a leader's ability influences the outcome of a crisis. As such, voters use outcomes as a signal of their leaders' quality. Leaders have incentives to make statements that deter their enemies abroad, since these statements also enhance their standing at home. Yet, such "cheap talk" foreign policy declarations are only credible when leaders suffer domestically if they fail to fulfill their commitments. In equilibrium, false promises are only made by the least competent types of leaders. Leaders that break their promises suffer electorally. Because initial domestic conditions and institutional arrangements affect the vulnerability of leaders to these domestic costs, such factors influence the credibility of policy declarations and, therefore, the crisis outcome.

In 1990, prior to the Gulf War, President Bush made explicit foreign policy statements regarding Iraq's invasion of Kuwait. In short, he threatened Saddam Hussein. When this failed to cow Hussein into withdrawing, Bush followed through on his threats and authorized force to remove the Iraqi army from Kuwait. By comparison, U.S. policy toward Bosnia was less direct. Both presidents Bush and Clinton adopted vague, ambiguous policies toward the Bosnian crisis, and U.S. intervention was limited. Potentially, Clinton could have used direct military force to lift the siege of Sarajevo, but he neither pursued this strategy nor threatened to do so. Sometimes threats carry the weight of direct action. For example, Clinton outlined the contingent circumstances under which he would authorize military intervention in Haiti; just before the announced deadline, the Haitian military junta relinquished power, alleviating the need for military force.

When leaders make threats, these statements are often taken as meaningful. Yet, leaders are not bound by these statements in any formal, legal, or moral sense: Threats are "cheap talk." When statements are nonbinding, why should other nations believe them? A common explanation is that leaders, particularly in democratic systems, pay "audience costs" if they fail to follow through on their commitments (Fearon 1994a, 1997; Martin 1993). Hence, having made belligerent statements and fearing the domestic consequences of reneging, leaders carry out their threats. Audience costs offer a mechanism via which leaders can credibly commit.

The concept of audience costs is problematic, however. It requires that citizens remove leaders who renege on their promises. Yet, if citizens are happy with their leader overall, then why should they throw her out of office simply because she fails to carry out one particular threat? Indeed, they may be delighted that she avoided foreign entanglement once she real-

ized that she was unable to influence the situation. In the literature, audience costs are simply assumed to exist. I provide microfoundations for why citizens want to remove leaders who fail to honor their commitments. In addition to explaining why audience costs work, I predict how domestic conditions and political institutions affect the extent to which these costs bind leaders and, hence, the extent to which threats influence crisis behavior.

Information plays a key role in answering the audience cost puzzle. Leaders vary in quality, and this is reflected in their ability to perform during crises. Talented leaders, with the appropriate skills, are more likely to be successful during a crisis than their less competent peers. Since ability affects outcomes, voters want to remove incompetent leaders, but they can only perceive leaders' ability through actions and performance. Thus, when choosing foreign policy, leaders must consider not only how it influences foreign rivals but also how it will be received at home. All else equal, leaders who expect to perform poorly in conflict avoid foreign entanglement. This is true for two reasons. The first is obvious: Poor performance is inherently undesirable. The second is that revealing low competence harms a leader's electoral prospects. This is particularly important in lopsided conflicts, when the winner may not be in doubt, but efficiency reveals a leader's ability.¹

In this setting, reneging on a commitment is a sign of incompetence, which the voters punish electorally. To see why, suppose that audience costs do exist and that voters do indeed punish leaders who fail to follow through on threats. For competent leaders, carrying out threats imposes few costs. They expect to do well in the crisis, and it provides them with an opportunity to reveal their abilities to the electorate. For less competent leaders, having their bluff called leaves them between a rock and a hard place. If they renege on their commitment, then they are punished domestically, which means that many of them engage in conflicts they would prefer to avoid. For the least able leaders, however, conflict is impractical. Since their poor performance will be electorally punished anyway,

Alastair Smith is an Assistant Professor of Political Science, Yale University, New Haven, CT 06520-8301.

An earlier version of this paper was presented at the Peace Science Society meeting, Columbus, Ohio, October 13-6, 1995. I thank the participants at that meeting; John Ginkel, Andrew Martin, Fiona McGillivray, and James Morrow; and several anonymous referees for their useful comments.

¹ The arguments do not require that the marginal effect of ability on outcomes be large.

they have no incentive to intervene, and they renege on their promises. Of course, this provides the justification for the electorate to punish them for failing to honor their commitments. Audience costs are endogenous. Since it is the least competent leaders who renege, broken commitments are a sign of incompetence which the voters punish.

This article ties together crisis behavior and domestic politics, simultaneously addressing how the latter shapes foreign policy and how crisis outcomes affect domestic political survival. In doing so, it produces a theoretical explanation of audience costs. Before presenting the full model, I consider different aspects of the puzzle. I start by examining a stylized model of extended deterrence and use it to explain the incentives that leaders face during international disputes. The conflictual nature of crises hampers communication between nations and leads to credibility problems. I explain why, in order to make threats or credible commitments, leaders must be able to send costly signals. Hence, intrinsically costless policy statements are informative only because of their domestic political implications. In this context, foreign policy choices have both international consequences—influencing the outcome of crises—and domestic consequences that affect voting decisions. After examining the links between domestic and international politics, I formally model foreign policy decision making within international crises against the backdrop of domestic politics. In doing so, I provide an explanation for the international/domestic nexus.

INTERNATIONAL CRISES

I consider the case of extended deterrence among three nations (Huth 1988). I focus on this potential war scenario, but the incentives this type of event creates could apply equally well to less intense forms of conflict.² In the stylized model, nation *A* is in a dispute with nations *B* and *C* over some issue. Suppose that nations *B* and *C* are initially content with the status quo, but nation *A* desires change. Nation *A* can attack nation *B*. If nation *B* acquiesces, then nation *A* gets its desired policy.³ If nation *B* resists, then the outcome depends upon which nation prevails in the conflict. I model the outcome of war as a lottery. Once a war starts, nation *C* can choose to intervene.

I illustrate the extensive form of the international crisis game in Figure 1. If *A* does not attack, then the status quo prevails. If *A* attacks and *B* surrenders, the outcome is acquiescence. Once *A* attacks and *B* resists, war occurs. The war becomes multilateral if *C* intervenes but remains bilateral if *C* stays neutral.

Each nation wants its preferred issue position to

² In the context of the model, traditional deterrence between two nations is a special case of the extended deterrence model, in which the protégé nation always resists.

³ In the three examples, acquiescence can be interpreted as the Kuwaiti government accepting the legitimacy of Saddam Hussein's annexation, the citizens of Sarajevo abandoning the city, and opposition parties accepting the junta as the rightful government of Haiti despite electoral results to the contrary.

FIGURE 1. The International Crisis Game

prevail. Yet, nations also want to avoid fighting. Conditional on having attacked, *A*'s preferences, from best to worst, are acquiescence, bilateral war, and multilateral war. When *B* surrenders, *A* is certain of attaining its goal. The more resistance *A* encounters, however, the smaller the chance that it wins. As *B* becomes likely to resist and *C* becomes likely to intervene, attacking becomes less attractive. While it is possible that *A* will attack knowing that this will lead to a multilateral war, the probability that *A* attacks is much higher if *A* believes *B* will surrender.

Both *B* and *C* want the status quo to prevail. Yet, if *A* attacks, then *B* must decide whether to fight or acquiesce. *B* is more likely to win any war if it receives allied intervention. Hence, *B* prefers a multilateral to a bilateral war, so its resistance depends in part on its expectations about *C*. Although *C*'s most preferred outcome is the status quo, it is *A* that chooses whether to disrupt it. *C* only gets to choose between intervening and remaining neutral. The decision to intervene depends upon whether the marginal effect of intervention on the probability of victory overcomes the costs of fighting. Intervention allows *C* to influence directly the crisis outcome, but *C* also can indirectly influence the course of events. Expectations about whether *C* will intervene affect whether *A* attacks and whether *B* resists. Therefore, if *C* can simply alter the expectations of *A* and *B*, then it can drastically alter the course of events.

CREDIBLE COMMUNICATIONS IN DETERRENT SITUATIONS

The international crisis game illustrates deterrence. Each nation's decision depends upon what it believes the other nations will do. For example, the more likely *C* is to intervene, the more likely *B* is to resist. The more likely *B* is to resist, the less likely *A* is to attack.

C would like to deter *A* from attacking *B* and can do so by convincing *A* that it is prepared to intervene. As in the standard deterrence problem, however, convincing *A* is difficult. Suppose that *C*'s leader releases a foreign policy statement saying that she will intervene if *A* attacks. If *A* believes this message and is deterred,

then *C* benefits because the status quo is maintained. Yet, *C* benefits whether or not the policy statement is true. Providing *A* believes *C*'s claims, *C* rarely has to intervene, because *A* is unlikely to attack in the first place. Therefore, independent of what *C* really intends to do, if *A* is deterred by threats, then *C* should threaten to intervene. Unfortunately, this creates a credibility problem: *C*'s messages are unrelated to her intentions. *A* should ignore threats because they are vacuous, containing no information about whether *C* will really intervene.

In general, if *A*'s response to any foreign policy statement favors *C*, then *C* always sends the intervention message, whether or not it is true. But the message should have no effect on *A*, since it does not reflect anything about *C*'s likely decision. This creates something of a paradox. Theoretically, neither nations nor domestic electorates have any reason to believe or respond to any foreign policy statements. Yet, empirically, threats and ultimatums sometimes work and announcements of policy often affect public opinion. To rectify this discrepancy, I explicitly model the role of domestic politics within international crises.

In the context of game theory, foreign policy statements that have no intrinsic cost are commonly termed "cheap talk." Jervis (1970) calls such costless messages signals. I show, as Jervis claims, that these signals can be informative, because they affect the beliefs, and hence the behavior, of domestic actors. Fearon (1994a, 1994b, 1997) correctly claims that in the international context alone, messages must be costly to be informative.⁴ Yet, foreign policy is not insulated from domestic concerns. Leaders simultaneously act at both the international and the domestic level. Providing that messages are costly in one setting, they can be informative in the other. Fearon assumes that there are exogenous domestic audience costs associated with foreign policy statements, and it is these which enable leaders to make credible threats. Specifically, Fearon assumes that leaders pay a fixed cost in terms of domestic support if they fail to follow through on their policy pledges. Why should voters want to punish leaders who bluff? Fearon assumes the existence of such costs but does not explain how they arise. In the international context, a leader who bluffs may well be acting in her nation's best interest. Suppose a leader, having failed to influence a crisis with threats, resists becoming embroiled in a war. Had her bluff succeeded, the nation as a whole would have benefited. Why should voters punish their leader when she believed that the war was not in her nation's interest? Surely the voters prefer a leader that remains neutral when the war is not worthwhile. Under these circumstances, it seems inappropriate for them to punish leaders who fail to carry out a single threat.

By simultaneously modeling crisis behavior and domestic elections, I offer a theoretical explanation for audience costs. The key is not that voters are unhappy with their leader's handling of the current crisis; rather,

the failure to carry out threats reveals information about a leader's ability. In other words, voters are content that their leader kept them out of the conflict, but in the future they want another leader. In addition to providing a microfoundation for audience costs, the model generates testable hypotheses relating domestic politics and foreign policy choice. Before presenting the model, I summarize some of the linkages between internal and external politics.

DOMESTIC POLITICS AND CRISIS BEHAVIOR

Political leaders have two audiences: domestic and international (Putnam 1988). Many scholars have observed that foreign policy and domestic politics are related (Russett and Graham 1989 summarize much of this literature). The more interesting issue is the direction of causality. Does the outcome of international events affect domestic survival, or does domestic politics drive the formation of foreign policy?

Studies of both voting decisions and public opinion conclude that foreign policy performance affects domestic political support (Aldrich, Sullivan, and Borgida 1989; Hurwitz and Peffley 1987; Mueller 1973; Ninic and Hinckley 1991). Although some of this research concludes that the domestic economy rather than foreign affairs is more important in explaining support, none finds international events unimportant. Furthermore, their influence is not limited to democratic systems. Bueno de Mesquita and Siverson (1995; also see Bueno de Mesquita, Siverson, and Woller 1992) find that, for all regime types, international outcomes affect domestic survival. For example, leaders who lose wars are more likely to be removed than successful leaders.

Other scholars suggest that the causal relationship runs in the opposite direction. For example, both Ostrom and Job (1986) and James and Oneal (1991) find that domestic political factors are more important in explaining foreign policy choice than are international factors. Regardless of an independent effect, the role of international events in domestic survival suggests that domestic politics should influence policy choice. Leaders who want to stay in office should select policies that help them achieve that goal. The choice depends upon domestic support and political institutions.

The diversionary war hypothesis suggests that leaders with domestic problems who anticipate being removed often undertake adventurous foreign policies that they would not otherwise attempt (Downs and Roche 1993; Hess and Orphanides 1995; Levy 1989; Richards et al. 1993; Smith 1996a). Since the model I present suggests similar results, it is worthwhile to examine the logic of this argument. Leaders often pursue risky policies abroad in order to divert attention from their domestic failures. Such policies may succeed, but often they do not. Since failure at the international level often results in removal, why would leaders take the chance? They may anticipate being removed anyway, so a policy failure would leave them

⁴ Sartori (1996) suggests that reputational issues generate these costs.

TABLE 1. International Payoffs

Nation	Outcome			
	Status Quo	Acquiescence	Bilateral War	Multilateral War
A	0	1	$1 - q(\Theta) - k_a$	$1 - p(\Theta) - k_a$
B	1	0	$q(\Theta) - k_b$	$p(\Theta) - k_b$
C	1	0	$q(\Theta)$	$p(\Theta) - k_c$

no worse off, whereas success could restore their fortunes. Leaders who enjoy popular support do not enact such policies, not wanting to jeopardize their survival.

The diversionary hypothesis implies that domestic political conditions drive the formation of foreign policy, but the explanation for this linkage requires a more complex understanding of the relationship. It is the domestic consequences of international outcomes that drive leaders to select particular policies. This suggests that causality does not run in a single direction. In my model, in addition to the common goals of the nation, leaders are motivated to select foreign policies because of their domestic consequences. The interaction of policy choice and leader evaluation is embedded within the context of an international dispute.

While it is important never to forget policy differences, within the international context voters typically care about their leader's ability. The outcome of international crises often resemble public goods. When a nation gains control of a resource or a piece of territory, this typically benefits the country as a whole. Therefore, the problem for the voters is not to find a leader with the same preference as themselves: All want their nation to succeed. Rather, at issue is finding a competent leader who can obtain the outcomes desired by voters. At least on international issues, I assume that voters choose between leaders on the basis of ability rather than policy differences.

In common with much of the literature, I assume that leaders differ in ability (Hess and Orphanides 1995; Richards et al. 1993; Smith 1996a). Some are competent, able to choose the right combination of forces, appoint skilled generals, adopt appropriate strategic plans, and persuade their allies to support them. Others are less adept. On average, competent leaders are more likely to be successful during an international crisis than are their less competent peers. More specifically, I assume that once a nation joins a war, the more competent its leader, the greater the probability that it will win. This is not to say that a leader's ability is the only determining factor; obviously, as in the numerical examples I present, such structural differences as military strength may have a dominating influence. The assumption I make is that, at the margin, the quality of leadership affects who wins.

THE MODEL

There are four players in the model: the political leaders in nations *A*, *B*, and *C* and the domestic

electorate in *C*. When I refer to *A*, *B*, and *C*, I mean the leaders as well as the states. The game has two stages, the international crisis phase and the domestic electoral phase. Figure 1 showed the international crisis stage. *C* sends a costless message indicating her foreign policy. Having observed this message, *A* decides whether to attack, *B* decides whether to resist, and *C* decides whether to intervene. Next, in the domestic electoral phase, the voters in nation *C*, having observed their leader's message and the outcome of the international crisis game, decide whether to retain their leader.

Of particular substantive interest is how each nation behaves after observing a particular foreign policy message. I define the probability that *A* attacks after observing message *m* as $\alpha(m)$. The probability of *B* retaliating after message *m* is $\beta(m)$. Given message *m*, *C* intervenes with probability $\gamma(m)$.

If a war occurs, then the expected outcome depends at least partly on the competence of the leaders involved. The more competent a nation's leadership, the greater the likelihood the nation will be victorious. Let θ_a represent the competence of *A*, θ_b represent *B*'s competence, and θ_c represent *C*'s competence. Let $\Theta = (\theta_a, \theta_b, \theta_c)$ be the competence of the leaders in each of the states. The probability that *B* wins a bilateral war is $q(\Theta)$. As *B* becomes more competent, $q(\Theta)$ increases. However, *B* is less likely to win if *A* is competent: $q(\Theta)$ is decreasing in θ_a . *C*, by intervening, increases the probability that *B* wins. The probability that *B* wins a multilateral war, $p(\Theta)$, is increasing in θ_b and θ_c and decreasing in θ_a . Hirshleifer (1989) provides an interesting discussion of the form that $q(\cdot)$ and $p(\cdot)$ should take as a function of resources. Here I assume that resources are fixed and instead consider how $q(\cdot)$ and $p(\cdot)$ depend upon leader competence. In the numerical examples, for simplicity, I assume that $p(\Theta)$ and $q(\Theta)$ are simple linear functions of Θ . Specifically, $p(\Theta) = (\theta_b + \theta_c - \theta_a)/6 + 0.6$, and $q(\Theta) = (\theta_b - \theta_a)/6 + 0.55$. This means that the most competent type of leader is about 17% more likely to be victorious than the least competent leader.

I assume that competence ranges between 0 and 1. Each leader knows her own ability but is uncertain of that of the others. In terms of incomplete information games, a leader's competence is her type (Harsanyi 1967–68). Let $\mu_i(\theta_i)$ represent the beliefs of the other players about the competence of the leader in nation *i*. For convenience, I assume that initial beliefs are uniformly distributed over the unit interval.

The payoffs from the international crisis game are summarized in Table 1. The most preferred outcome of *B* and *C* is the status quo. If *B* acquiesces, then *B* and

C receive a payoff of 0. If a war occurs, then their payoffs are the probability of victory: $p(\Theta)$ if the war is multilateral or $q(\Theta)$ if the war is bilateral, minus the cost (k) of fighting (k_b and k_c , respectively). A receives a payoff of 0 for the status quo; its most preferred outcome is acquiescence. If A becomes involved in a war, then its payoff is its probability of victory: $(1 - p(\Theta))$ for a multilateral war or $(1 - q(\Theta))$ for a bilateral war, minus the cost of fighting, k_a . In addition to caring about international outcomes, C receives a payoff of Ψ if she is reelected in the domestic electoral phase.

Elections

The election that follows the international crisis provides voters in C the opportunity to replace their leader. I assume that they evaluate her on two dimensions. First, they care about competence. Since it affects performance in future international events, the more competent they believe their leader to be, the more likely they are to retain her. Second, voters care about how their leader has performed on all other issues. Rather than explicitly modeling a leader's performance on these other policy dimensions, I assume that her ability can be represented by a single parameter, *bias*.

The bias parameter, which is analogous to Hess and Orphanides's (1995) domestic handling ability characteristic, reflects a leader's performance on issues other than the international dimension. It thus reflects the extent to which voters are predisposed to reelect the incumbent. If, for example, C has performed exceptionally well during her time in office ($\text{bias} \gg 0$), then the voters are likely to retain her, independent of how well she performs on foreign policy. The voters are indifferent about retaining a leader with a mediocre record ($\text{bias} \approx 0$), so their assessment of her international performance will have a large effect on whether she remains in office. When the electorate is predisposed against a leader ($\text{bias} \ll 0$), she is unlikely to survive in office, regardless of foreign policy performance.

I assume that voters are rationally retrospective, using the information they have learned about a leader's performance in deciding whether to retain her.⁵ When the election occurs, the voters compare their current leader to the challenger. The greater their predisposition (*bias*) toward the incumbent and the more competent they think she is, the more likely they are to retain her. Having seen the foreign policy message, m , and the international outcome, z , suppose the voters believe that the expected competence of C is $E[\theta_c|m, z]$. Given these beliefs, the probability they will reelect the incumbent is $\Phi(E[\theta_c|m, z], \text{bias})$,

where $\Phi(\cdot)$ is a strictly increasing function of $E[\theta_c|m, z]$ and *bias*. This function reflects the greater difficulty for a challenger to defeat popular, competent leaders than unpopular, incompetent ones. For the numerical examples, I assume that $\Phi(\cdot)$ is the cumulative density function of a standard normal distribution evaluated at $(E[\theta_c|m, z] - 0.5 + \text{bias})$. Thus, if *bias* = 0, then, ex ante, the probability of reelection is 50%. For brevity, I drop the *bias* term from the notation when it is not essential.

Voter Beliefs

Before the international crisis game, the voters' prior beliefs about C , $\mu_c(\theta_c)$, are uniform. Then the voters learn about C 's type by her choices and performance. Given C 's strategy, Bayes's rule defines the voters' posterior beliefs about C 's type. For example, if only extremely competent types send message m' , then upon seeing the message m' , the voters (and other nations) believe that C is extremely competent. Alternatively, if all types send the same message, then the voters cannot update their beliefs upon observing the message.

Voters also learn about C 's type if she engages in a war. Since C 's type determines her ability to fight, I assume that C 's competence is fully revealed if she becomes involved in a war. This is the updating rule used by Hess and Orphanides (1995), and it is used to calculate the numerical examples. An alternative and equally realistic assumption, however, is that the voters observe C 's success during the war but do not observe her competence directly. Since voters know that more competent leaders are more likely to win, they can update their beliefs from the outcome of the war (the updating rule used in Richards et al. [1993] and Smith [1996a]). In this scenario, C 's incentives remain as described, although the numerical calculations will differ. The main propositions are not sensitive to this choice of assumption.

RESULTS

I discuss the results in two sections. In the first, crisis behavior in the absence of credible threats is examined. I explain how the domestic conditions in C affect the behavior of all nations involved in the crisis. In addition to generating useful predictions about how domestic political conditions influence foreign policy, these results lay the groundwork for explaining how audience costs are generated. In the second section, I discuss why foreign policy statements are credible and why domestic electorates punish leaders who renege on their threats. I explain the intuition behind the results and illustrate their implications using several numerical examples. The technical results, proofs of the proposition, and equilibrium refinements are discussed fully in the Appendix.

⁵ See Alesina, Londregan, and Rosenthal 1993; Ferejohn 1986; Persson and Tabellini 1990; Rogoff and Silbert 1988; and Smith 1996b for discussions about the differences between retrospective and prospective voters. I assume that international competence and domestic performance are independent.

Crisis Behavior in the Absence of Credible Threats: Babbling Equilibria

Consider the case in which foreign policy statements are uninformative. Suppose that, independent of her type, C randomly picks a foreign policy message. Such messages are typically referred to as babbling. Since each type is equally likely to send any particular message, neither foreign nations nor domestic audiences can update their beliefs about C 's competence. Since messages are uninformative, all being identically interpreted, C is indifferent about which message to send. I characterize crisis behavior in babbling equilibria as follows.

Crisis Behavior. Competent leaders expect to perform well if they become involved in a war. Therefore, competent leaders are likely to behave aggressively and become involved in war (Banks 1990). The greater C 's competence, the larger her marginal effect on the outcome of the war, and the more likely her assessment that intervention is worthwhile. Similarly, competent types of A and B expect to perform well should a war occur. Hence, when B is competent, B is more likely to resist; when A is competent, A is more likely to attack. Therefore, competent A types attack, competent B types retaliate, and competent C types intervene.

PROPOSITION 1: *For any beliefs about C 's type $\mu_c(\theta_c|m)$, the behavior of nations A , B , and C can be characterized by a unique triple: $(\theta_a^*(m), \theta_b^*(m), \theta_c^*(m))$. A only attacks if its type is greater than $\theta_a^*(m)$, B only retaliates if its type is greater than $\theta_b^*(m)$, and C only intervenes if its type is greater than $\theta_c^*(m)$. Having observed m , the probability that A attacks is $\alpha(m) = 1 - \theta_a^*(m)$, the probability that B retaliates is $\beta(m) = 1 - \theta_b^*(m)$, and the probability that C intervenes is $\gamma(m) = \int_{\theta_c^*(m)}^1 \mu_c(\theta_c|m) d\theta_c$.*

Consider A 's decision to attack. Given $\theta_b^*(m)$ and $\theta_c^*(m)$, A knows the probability that B retaliates and that C intervenes. In addition, A knows the distribution of competence for those types that resist and therefore knows how well he expects to do if he becomes involved in war. Anticipating how B and C will respond, each type, θ_a , calculates the expected payoff from attacking. The higher A 's type, the larger this expected reward. $\theta_a^*(m)$ is simply the type that is indifferent about attacking. Those types above $\theta_a^*(m)$ attack, those types below $\theta_a^*(m)$ do not. B and C structure their decisions in an analogous manner.

Crisis outcomes are informative; they tell us something about each leader's type. Since the more competent types of A attack, if the crisis outcome is the status quo, then A must be a lower type. If he were not, then he would have attacked. When A fails to attack, observers should shift beliefs about A 's type downward.

Alternatively, their beliefs about A 's type increase if A attacks.

Observers can similarly update beliefs about B and C given their actions. For example, if a war occurs and C fails to intervene, then C must be a lower type. If she were a higher type, then she would have intervened. Therefore, following a bilateral war, C is viewed as less competent than previously thought. Since voters care about the competence of their leader, they are less likely to retain one who fails to intervene. Next I focus on how this information affects voting decisions and drives leaders toward hawkish policies.

Domestic Politics Makes Leaders Hawkish

PROPOSITION 2: *Domestic politics makes C more likely to intervene than international factors alone would predict.*

On the basis of international factors alone, C should only intervene if the marginal effect on the probability of victory outweighs the costs of fighting. Mathematically, C should only intervene if $\bar{p}(\Theta) - k_c \geq \bar{q}(\Theta)$, where $\bar{p}(\Theta) = \int_{\theta_b^*}^1 \int_{\theta_a^*}^1 p(\Theta) d\theta_a d\theta_b$, the average probability of victory if C intervenes, and $\bar{q}(\Theta) = \int_{\theta_b^*}^1 \int_{\theta_a^*}^1 q(\Theta) d\theta_a d\theta_b$, the average probability of victory for B in a bilateral war. Domestic political incentives encourage C to intervene even when this condition is not met. Hence, C may intervene when the costs outweigh the expected benefits. Why? The answer lies in what the voters infer when a leader fails to intervene.

Suppose that leaders decide to intervene on the basis of international concerns only. Under these conditions, more competent leaders intervene, and less competent types remain neutral. Suppose that in a particular case, on the basis of international factors alone, only types with competence greater than $1/2$ intervene. When the voters see the outcome of the crisis, what do they infer about their leader? If C intervenes, then the voters observe C 's type directly, so they know exactly how competent she is. If C does not intervene, then the voters only know that C 's competence is less than $1/2$. Thus, the expected competence of types who do not intervene is $1/4$.

Now suppose that C 's type is $7/16$. Since this is less than $1/2$, on the basis of international considerations alone, she should not intervene. Yet, domestic considerations suggest otherwise. If C remains neutral, then the voters know that her type is less than $1/2$. If she intervenes, then the voters will find out that her type is $7/16$. The voters are more likely to retain a leader of competence $7/16$ than one of expected competence $1/4$. By intervening, C enhances her reelection prospects.

Domestic political incentives bias leaders toward hawkish strategies. The magnitude of this effect depends upon domestic conditions. Suppose that C is extremely popular, that is, bias is high, and she is likely

FIGURE 2. Effect of Initial Domestic Conditions on Crisis Behavior (Numerical Example of a Babbling Equilibrium)

Note: The probability of reelection is $\phi(E[\theta_c|m, z] - 0.5 + \text{bias})$, where $\phi(\cdot)$ is the cumulative density function of a standard normal distribution. $p(\Theta) = (\theta_b + \theta_c - \theta_a)/6 + 0.6$, $q(\Theta) = (\theta_b - \theta_a)/6 + 0.55$, $k_a = 0.6$, $k_b = 0.5$, $k_c = 0.2$, $\psi = 1$.

to be reelected. She realizes that her international performance is unlikely to affect her chances in the next election. Since she expects to be reelected whatever her actions, her predisposition toward violence is small. Similarly, if C is extremely unpopular, $\text{bias} \ll 0$, then international performance alone is unlikely to make a big difference in the electoral outcome. Again, leader C 's prejudice toward violence is small. Leaders have the largest predisposition toward violence when elections are anticipated to be close. When the voters are not heavily inclined toward a leader, their evaluation of international competence has a large effect on their decision. In the numerical example, I model the reelection decision using a cumulative normal density function. As is commonly observed in probit models, the marginal effect of foreign policy evaluation is greatest when, ex ante, the election is anticipated to be close. A numerical example is shown in Figure 2. The probability of intervention, $\gamma(m)$, is greatest when elections are close ($\text{bias} \approx 0$). As the marginal influence of international competence on an election declines (high or low bias), C is less likely to intervene. This is consistent with empirical observations by Russett (1990; also see Morrow 1991) that mild but not severe recessions are associated with the use of force abroad.

This has interesting implications for the interpretation of foreign policy. To illustrate, consider an extremely unpopular leader ($\text{bias} \ll 0$) and one of average popularity ($\text{bias} \approx 0$). The former is unlikely to survive even with a foreign policy success, therefore, she has little domestic incentive to intervene and the probability of intervention is low. The latter is more likely to intervene, given the marginal effect of foreign policy on elections. How voters interpret nonintervention varies. In the latter case, many types intervene, and the types who fail to intervene must be the very lowest types. If C fails to intervene, then the voters believe she has little competence. When the probability of intervention is low, however, failing to intervene carries less information; an unpopular leader who remains neutral may appear less competent to voters than previously, but the downward shift is small. How the electorate evaluates nonintervention depends upon initial domestic conditions.

The domestic context affects how a policy is interpreted, a leader's choice of actions, whether a leader sends informative messages, and how those messages are viewed. This has implications for empirical studies of the relationship between domestic politics and foreign policy. The model indicates that the magnitude of

foreign policy effects on public opinion and reelection depends upon initial domestic conditions.

The more leaders care about reelection (increasing Ψ), the greater the probability that they will intervene. Policy-driven leaders are less inclined toward ill-advised foreign policy actions than leaders who care primarily about reelection. This has electoral cycle implications (Gaubatz 1991; Morrow 1991; Stoll 1984). As new elections approach, we might suspect that leaders become increasingly concerned about reelection and therefore hawkish late in their term (Downs and Rocke 1993; Hess and Orphanides 1995; Smith 1996a).

Initiation, Retaliation, and Intervention

PROPOSITION 3: *Intervention and initiation are negatively related. As the probability that C intervenes increases, A is less likely to attack.*

Figure 2 illustrated the relationship between initiation, retaliation, and intervention with a numerical example. C 's propensity to intervene depends upon her internal political situation. When the voters' evaluation of her international performance strongly influences the electoral outcomes (bias ≈ 0), C is likely to intervene. If A attacks under these conditions, then A should anticipate a multilateral conflict. Yet, if C is popular (bias ≈ 1), then C is unlikely to intervene, and A should anticipate a bilateral conflict. Since A prefers a bilateral to a multilateral war, A is more likely to attack when C is extremely popular rather than when C has mediocre support. Interestingly, A 's decision to initiate violence depends, at least in part, upon domestic conditions in another nation.

In general there is an ambiguous relationship between retaliation, β , and intervention, γ . Intervention can either increase or decrease the probability of retaliation, depending upon the parameters of the particular case. Two competing factors influence B 's decision. The likelihood of intervention means that B anticipates more support in its fight against A , which encourages B to retaliate. Yet, since intervention should deter A from attacking, if B is actually attacked, then it knows its aggressor is extremely competent and may decide to acquiesce. In Figure 2 intervention and retaliation are negatively related, the latter influence outweighing the former, but this is not a general result; under other conditions β and γ are positively related.

The significance of proposition 3 is that domestic conditions in nation C affect foreign policy decisions in nations A and B (Morrow 1991). As the probability of intervention increases, the probability of initiation and retaliation declines. This creates a sample selection problem in testing how domestic affairs affect C 's foreign policy (Achen 1986; Fearon 1993; Morrow 1989; Smith 1996c). We can only observe C 's intervention decision when war occurs, but the probability of

war depends upon what C is likely to do should war actually occur. In terms of empirical testing, this is problematic and leads to incorrect statistical inference unless we control for the selection effect.

The discussion of uninformative equilibria shows that (1) domestic politics can make C hawkish, (2) domestic politics in C affect A and B 's decisions, and (3) initial domestic conditions affect how voters interpret a leader's actions. These properties remain true in informative equilibria.

Making Threats Work

In order for threats to work they must convey information about a leader's intentions. When messages are costless to send, it is difficult for leaders to signal their type (Crawford and Sobel 1982). Yet, leaders can make credible threats in the international arena because of the domestic ramifications of failing to follow through. I show that if messages are informative, then the electorate wants to punish leaders who fail to honor their policy commitments. This generates audience costs and allows leaders to send informative messages. I explain the logic of the argument using an example. The properties of informative equilibria are formally characterized in the Appendix.

An Informative Message Equilibrium. In this equilibrium, competent leaders threaten to intervene; less competent leaders do not threaten. Should war occur, only those leaders who made threats intervene. Figure 3 shows a pictorial representation. More formally, there is a critical type θ_c^* . Leaders who are more competent than this critical type ($\theta_c \geq \theta_c^*$) send message m_1 and intervene if a war occurs. Lower types ($\theta_c < \theta_c^*$) send message m_2 and remain neutral if a war occurs. Substantively, m_1 can be thought of as a threat to intervene. Since different types send different messages, the behavior of voters and foreign nations depends upon whether C makes threats. Before explaining why C 's threats are credible, I examine how voters and foreign nations respond to each message.

If the voters observe a threat (message m_1), then they infer that C is competent: Specifically, $\theta_c \geq \theta_c^*$. Therefore, the expected competence of C is $(1 + \theta_c^*)/2$. Less competent types ($\theta_c < \theta_c^*$) do not make threats (message m_2). The expected competence of a type who sends m_2 is $\theta_c^*/2$. Since $(1 + \theta_c^*)/2 > 1/2 > \theta_c^*/2$, leaders receive an increase in electoral support if they threaten, but the electoral support for leaders who remain passive declines. In equilibrium, types who send message m_2 never intervene, so the voters never get the opportunity to update their beliefs about these types. The voters may get additional opportunities to learn about those types who do make threats. If C 's bluff is called and a war occurs, then the voters observe whether C carries out her threats.

FIGURE 3. Leader C's Strategy in an Informative Equilibrium

In equilibrium, only competent leaders make threats. These types also carry them out. If C makes a threat, then A knows that C is a competent type ($\theta_c \geq \theta_c^*$) who will intervene ($\gamma(m_1) = 1$). If C makes no threat, then A knows that all wars will remain bilateral ($\gamma(m_2) = 0$). Since A 's probability of initiation declines as C intervenes more often, threats deter A from attacking ($\alpha(m_1) < \alpha(m_2)$). By making threats, C benefits internationally because A attacks less often.

There are clear advantages to making threats. C benefits domestically, by increasing her chance of reelection, and internationally, by deterring A from attacking. Why does every type not send m_1 ? Why are C 's threats credible? Despite the advantages of sending m_1 , there is the disadvantage of audience costs associated with unfulfilled threats. Leaders are punished electorally by the voters if they fail to keep their promises. In equilibrium, all types who threaten to intervene, m_1 , actually do so. What should the voters believe if C threatens but does not intervene? Unfortunately, Bayes's rule is undefined in these circumstances. Therefore, any beliefs are consistent with the sequential equilibrium concept. Standard refinements (discussed in the Appendix) suggest that the type with the largest incentive to remain neutral once having sent m_1 is the lowest type, $\theta_c = 0$. Using this restriction, the voters believe the expected competence of a type who makes threats (sends m_1) but does not intervene is

zero: $E[\theta_c | m_1, \text{Bilateral war}] = 0$. Leaders who fail to fulfill their foreign policy commitments have little chance of reelection. $E[\theta_c | m_1, \text{Bilateral war}] = 0 < E[\theta_c | m_2] = \theta_c^*/2 < E[\theta_c | m_1] = (1 + \theta_c^*)/2$. This reduction in the probability of reelection is what Fearon (1994a) calls a domestic audience cost. It is a loss that leaders suffer when they do not honor their commitments. Yet, it is neither an exogenous fixed cost nor a mechanism to take the decision out of the leader's control (Fearon 1997). Leaders choose to honor their commitments because of the electoral consequences of failing to do so. These costs are endogenously generated by equilibrium behavior.

Although threats deter A from attacking, sometimes C 's bluff is called, and C must choose whether to intervene. High types intervene because, being competent, they expect to perform well in the war, and it affords them an opportunity to show their competence to the voters. For less competent types, intervention is unattractive; they not only will perform badly but also will reveal their low competence to the voters. Yet, failing to intervene is also unattractive, since the voters will punish them electorally. Rather than risk this eventuality, low types send message m_2 . For high types the cost of carrying out threats is low. For type θ_c^* , the electoral and deterrence advantages of m_1 and the costs of having to intervene should a war occur exactly counterbalance the payoffs associated with sending m_2 .

FIGURE 4. Initial Domestic Conditions Affect Whether C Threatens and How A and B Respond in an Informative Equilibrium

and remaining neutral (type $\theta_c^\dagger$ is indifferent between sending m_1 and m_2). Types below $\theta_c^\dagger$ prefer to play safe, sending m_2 , rather than risk sending m_1 and having their bluff called. Types above $\theta_c^\dagger$ prefer to send m_1 because, being competent, they face lower costs for honoring their commitments.

Figure 4 illustrates a numerical example of the informative message equilibrium. In the example, A always attacks unless it receives a threat, m_1 . Upon observing a threat, A believes that C will intervene. C 's cheap talk partially deters A from attacking because C 's threat is credible.

Leaders are able to send credible messages because they mortgage their domestic political survival on their ability to honor their commitments. Without the ability of the electorate to remove leaders, leaders cannot credibly communicate their intentions. Domestic conditions limit whether leaders can make credible statements. Absolute rulers, who cannot be removed, cannot communicate their intentions to other nations. Similarly, lame-duck presidents find it hard to make credible commitments. Without voter retaliation to keep them honest, their threats are less likely to be believed.

Since domestic politics enables leaders to communi-

cate credibly, domestic circumstances affect which messages are sent and how these messages are interpreted. The electoral advantage of convincing the voters that you are competent depends upon your initial domestic prospects. Thus, domestic factors affect both the probability with which C threatens and how other nations interpret these threats. Figure 4 showed that if C is popular (bias ≈ 0.75), and hence likely to get reelected, then fewer types consider it worthwhile to threaten (send m_1). Note the probability that A will attack, given the threat $\alpha(m_1)$, declines as bias increases. As fewer types send the threat, the average competence of the types who intervene increases. Since A has to combat a more competent type, it attacks less often when threatened. Interestingly, it is when the domestic incentives to send threats are small, and hence few types make threats, that threats have the largest deterrent effect.

General Properties of Informative Message Equilibria. The properties of informative message equilibria are characterized in the Appendix (lemmas 2, 3, and 4). The following statements summarize the substance of these lemmas. *In general, the existence of informative message equilibria depends upon the ability of leaders to*

mortgage their domestic political future. Equilibria can only be informative if war occurs with positive probability.

Without the possibility of war, leaders never face the prospect of having to honor their commitments. Under these circumstances, all types send any message that deters A , since they know that they will never have to make good on their promise. Since all types can send any message that benefits them, there is no useful communication. The possibility of war is necessary to keep leaders honest.

CONCLUSION

The model leads to two sets of results. First, it characterizes crisis behavior and shows how domestic conditions within a single nation affect foreign policy decisions by all nations involved in a crisis. Second, it shows how this linkage between domestic politics and foreign policy enables leaders to issue credible threats that deter adversaries. By explaining why voters punish leaders who fail to follow through on their threats, I generate a theory for the creation of audience costs. These costs make foreign policy statements meaningful.

Political leaders have two audiences, their domestic constituents and their foreign rivals. When forming foreign policies, leaders simultaneously balance these internal and external constraints. Hence, international events and domestic political survival are intrinsically linked, not through a simple unidirectional causal pathway, but via a series of strategic interactions at both the international and the domestic level.

A consequence of these linkages is that leaders adopt hawkish policies. Voters want to retain competent leaders and remove incompetent ones. Since competent leaders expect to perform better, they are more likely to intervene in international disputes. Given this, nonintervention signals lower competence. Leaders who want to retain office avoid being labelled incompetent by intervening. This desire to separate themselves from the low competence types creates a bias toward violent behavior. They enter wars in which, on the basis of international factors alone, they should not intervene.

The extent of this hawkish bias depends on domestic political circumstances. When the voters' evaluation of a leader's competence will have little effect on the election, leaders have little incentive to behave aggressively, and the bias toward violence is small. As a result, leaders who are either extremely secure or extremely insecure base their policies mainly on international considerations. For example, absolute rulers or lame-duck presidents intervene on the basis of international conditions alone. When leaders anticipate close elections, their competence is an important issue, and the incentive to distinguish themselves make them extremely hawkish. This does not necessarily imply that

they become involved in more wars. As domestic politics makes leaders more aggressive, it also deters other nations from initiating violence. As the probability of intervention increases, $\gamma(m)$, the probability of initiation, $\alpha(m)$, declines. So elections reduce the opportunities for intervention but increase a nation's propensity to intervene in each particular case. In general, the net effect of domestic politics on the occurrence of war is ambiguous; it depends upon the characteristics of each case.⁶

The interaction of domestic and international politics enables leaders to make credible threats. Simple statements of foreign policy are informative because of the domestic electoral implications of not following through with an announced policy. The model explains how these audience costs arise. Since voters punish leaders who do not carry out their threats, leaders run a risk if they make threats. If their bluff is called and a war occurs, then they must decide whether to intervene, and failure to do so harms reelection prospects. A leader's competence determines the benefit of intervening. A highly competent leader may actually welcome the opportunity, since it allows her to demonstrate her superior abilities to the voters. Less competent leaders, although they want to avoid fighting, are also compelled to intervene to avoid being punished electorally. For the least competent leaders, intervention is not an option; their poor performance would provide yet more evidence of their low quality, and they will suffer the same electoral fate whatever they decide to do. This provides the justification for audience costs in the first place. If a leader fails to follow through on a threat, then the voters should infer that she is incompetent and want to replace her.

The model explains the origin of domestic audience costs. Threats deter foreign aggression through two mechanisms: commitment and information. Audience costs allow leaders to commit to a course of action that they otherwise would not undertake. Once a threat is made, a leader faces a cost for backing down, and this cost makes intervention more attractive. Threats also work because they inform aggressors that their adversary is competent. Since competent leaders face the lowest costs for carrying out threats, they find the use of threats attractive. When an aggressor receives a threat, he knows that the leader not only is committed to carrying it out but also is competent. The prospect of becoming involved in a multilateral conflict against a competent adversary deters aggression.

When leaders make threats they jeopardize their domestic political prospects. The extent of their domestic vulnerability is associated with the degree of audience costs. This supports Fearon's (1994a) conjecture that electorally vulnerable democratic leaders

⁶ Other studies that observe this ambiguity include Fearon 1994a, Morrow 1994, and Smith 1995.

have larger audience costs than their autocratic rivals. At the extreme, when leaders have nothing to risk, they cannot commit to carrying out their threats. Therefore, their foreign policy announcements are uninformative.

Foreign policy statements convey information about a leader's type and propensity to intervene. Such statements can deter foreign aggression because the pledge to intervene is credible. They also affect public opinion because they tell voters about the government's level of competence. The exact interpretation of a foreign policy message and its effect on other nations and public opinion at home depends upon initial domestic conditions. Empirical assessments of foreign policy should consider the context in which a particular policy is taken.

APPENDIX

Rigorous Description of the Model

C announces a foreign policy message, $m \in M$. Having observed this message, A chooses whether to attack (att , $\sim att$). If A attacks, then B chooses whether to retaliate (ret , $\sim ret$). If B retaliates, then C chooses whether to intervene (int , $\sim int$). Let $Z = \{MUWAR, BIWAR, ACQ, SQ\}$ be the set of international outcomes. If A attacks, B retaliates, and C intervenes, then a multilateral war occurs, $MUWAR$. If A attacks, B retaliates, but C does not intervene, then a bilateral war occurs, $BIWAR$. Acquiescence (ACQ) occurs if A attacks but B does not resist. Finally, the outcome is the status quo (SQ) if A does not attack. The payoffs from the international outcome, shown in Table 1, depend upon the competence of the nations.

The competence, or type, of the nations is $\Theta = (\theta_a, \theta_b, \theta_c)$. Let $\mu_i(\theta_i)$ be the prior probability density over θ_i . Although I assume that θ_i , $i = a, b, c$ is distributed uniformly over the unit interval ($\mu_i(\theta_i) = 1$ for $\theta_i \in [0, 1]$), all that is important for the following results is that the distribution over types is continuous and bounded away from zero for all types. Each nation knows its own type but only knows the distribution of the other nations' competence. Competence affects the expected outcome of the war: $p(\Theta) \rightarrow [0, 1]$ and $q(\Theta) \rightarrow [0, 1]$. B's probability of winning increases if C intervenes: $p(\Theta) > q(\Theta)$. I assume that both $p(\cdot)$ and $q(\cdot)$ are differentiable in all components: Specifically, $dp(\Theta)/d\theta_a < 0$, $dq(\Theta)/d\theta_a < 0$, $dp(\Theta)/d\theta_b > 0$, $dq(\Theta)/d\theta_b > 0$, $dp(\Theta)/d\theta_c > 0$, and $dq(\Theta)/d\theta_c = 0$. The competence of any nation that becomes involved in a war is revealed.

C's strategy is the pair (σ_c, s_c) , where $\sigma_c: \Theta_c \times M \rightarrow [0, 1]$ and $s_c: \Theta_c \times M \rightarrow [0, 1]$. A's strategy is $s_a: \Theta_a \times M \rightarrow [0, 1]$. B's strategy is $s_b: \Theta_b \times M \rightarrow [0, 1]$. Thus, $\sigma_c(m, \theta_c)$ is the probability that type θ_c sends message m ; $s_a(\theta_a, m)$ is the probability that type θ_a attacks having observed the message m ; $s_b(\theta_b, m)$ is the probability that type θ_b retaliates having observed the message m ; and $s_c(\theta_c, m)$ is the probability that type θ_c intervenes given message m . Let the notation $m(\theta_c)$ mean that θ_c sends message $m(\theta_c)$ with positive probability.

In addition to payoffs from international outcomes, the leadership of C receives a payoff of $\Psi > 0$ if reelected by the voters following the international crisis. The probability that the voters reelect C, $\Phi(E[\theta_c|m, z], bias)$ increases with the expected competence of C and the electorate's bias toward C (Hinich 1978). The justification for this assumption is that,

after the international crisis but before the election, the voters learn about the qualities of the alternative leadership. At the election, the voters choose the leadership they prefer. When the government makes its decisions it does not know what information the voters will receive. If the information about the opposition party is distributed normally, then when the leader makes her decision, the voters' decision rule appears probabilistic. Once the information is revealed the actual voting decision is deterministic. Yet, prior to this revelation, voting appears probabilistic (Austen-Smith 1987; Smith 1996b).

The solution concept is sequential equilibrium (Kreps and Wilson 1982). This requires that the strategies of A, B, and C are utility maximizing, given the strategy of the other players and their beliefs. The strategy of the voters, reelecting C probabilistically, is utility maximizing by assumption. In addition, sequential equilibria require that all players' beliefs are consistent with the Bayesian rule.

Results

C's Decision to Intervene. C's expected utility for intervening is

$$U_c(int|\theta_c, m) = \int_0^1 \int_0^1 \mu_a(\theta_a|att) \mu_b(\theta_b|ret) p(\Theta) d\theta_a d\theta_b \\ - k_c + \Psi * \Phi(E[\theta_c|m, MUWAR]),$$

where $\mu_a(\theta_a|att)$ is posterior beliefs about A's type, given that it attacks, and $\mu_b(\theta_b|ret)$ is posterior beliefs about B's type, given that it retaliates.

C's expected utility for not intervening is

$$U_c(\sim int|\theta_c, m) = \int_0^1 \int_0^1 \mu_a(\theta_a|att) \mu_b(\theta_b|ret) q(\Theta) d\theta_a d\theta_b \\ + \Psi * \Phi(E[\theta_c|m, BIWAR]).$$

Since $p(\Theta)$ is increasing in θ_c , $U_c(int|\theta_c, m)$ is strictly increasing in θ_c . $U_c(\sim int|\theta_c, m)$ is constant in θ_c . Define $\theta_c^*(m)$ as the type indifferent about whether to intervene (if such a type does not exist, then set $\theta_c^*(m)$ to the appropriate limiting value; that is, if all types prefer to intervene, then $\theta_c^*(m) = 1$; if all types prefer not to intervene, then $\theta_c^*(m) = 0$). Thus, C's equilibrium strategy is $s_c(\theta_c, m) = 1$ if $\theta_c \geq \theta_c^*(m)$, and $s_c(\theta_c, m) = 0$ otherwise.

Let $\gamma(m)$ represent the probability that C intervenes, given the message m . Thus, $\gamma(m) = \int_{\theta_c^*(m)}^1 \mu_c(\theta_c|m) d\theta_c$, where $\mu_c(\theta_c|m)$ is the posterior distribution of θ_c , given the message m .

B's Decision to Retaliate. If B retaliates, then its expected utility, given its type, is

$$U_b(ret|\theta_b, m) = \int_0^1 \mu_a(\theta_a|att) \left(\int_{\theta_c^*(m)}^1 \mu_c(\theta_c|m) p(\Theta) d\theta_c \right. \\ \left. + (1 - \gamma(m)) q(\Theta) \right) d\theta_a - k_b.$$

If B does not retaliate, then it receives a payoff of $U_b(\sim ret|\theta_b, m) = 0$.

Since $p(\cdot)$ and $q(\cdot)$ are increasing in θ_b , $U_b(ret|\theta_b, m)$ is strictly increasing in θ_b . Define $\theta_b^*(m)$ as the type indifferent about whether to retaliate (if such a type does not exist, then

set $\theta_b^*(m)$ to the appropriate limit). Thus, B 's equilibrium strategy is $s_b(\theta_b, m) = 1$ if $\theta_b \geq \theta_b^*(m)$, and $s_b(\theta_b, m) = 0$ otherwise. Ex ante, the probability that B retaliates, given the message m , is $\beta(m)$, where $\beta(m) = \int_{\theta_b^*(m)}^1 \mu_b(\theta_b) d\theta_b = 1 - \theta_b^*(m)$.

A's Decision to Attack. If A attacks, then its expected utility is

$$U_a(att|\theta_a, m) = 1 - \beta(m) + \int_{\theta_b^*(m)}^1 \int_{\theta_c^*(m)}^1 \mu_c(\theta_c|m) \\ (p(\Theta) - k_a) d\theta_b d\theta_c + (1 - \gamma(m)) \int_{\theta_b^*(m)}^1 \\ (q(\Theta) - k_a) d\theta_b.$$

If A does not attack, then its expected payoff is $U_a(\sim att|\theta_a, m) = 0$. Unless $\beta(m) = 0$, in which case all types attack, A 's expected payoff from attacking is strictly increasing in θ_a . Define $\theta_a^*(m)$ as the type indifferent about whether to attack (if such a type does not exist, then set $\theta_a^*(m)$ to the appropriate limit). Thus, A 's equilibrium strategy is $s_a(\theta_a, m) = 1$ if $\theta_a \geq \theta_a^*(m)$; and $s_a(\theta_a, m) = 0$ otherwise. Ex ante, the probability that A attacks, given the message m , is $\alpha(m)$, where $\alpha(m) = \int_{\theta_a^*(m)}^1 \mu_a(\theta_a) d\theta_a = 1 - \theta_a^*(m)$.

PROPOSITION 1. For any posterior beliefs about C 's type, given the message m , $\mu_c(\theta_c|m)$, there exists a unique triple: $(\theta_a^*(m), \theta_b^*(m), \theta_c^*(m))$. A only attacks if its type is greater than $\theta_a^*(m)$, B only retaliates if its type is greater than $\theta_b^*(m)$, and C only intervenes if its type is greater than $\theta_c^*(m)$. Having observed m , the probability that A attacks is $\alpha(m) = 1 - \theta_a^*(m)$, the probability that B retaliates is $\beta(m) = 1 - \theta_b^*(m)$, and the probability that C intervenes is $\gamma(m) = \int_{\theta_c^*(m)}^1 \mu_c(\theta_c|m) d\theta_c$. (Proof follows directly from the above description of A , B , and C 's decisions.)

Bayesian Updating and Out-of-Equilibrium Beliefs. C 's strategy, $s_c(m, \theta_c)$, is the probability with which type θ_c sends message m . By Bayes's rule and initial uniform beliefs, the posterior beliefs about C 's type are $\mu_c(\theta_c|m) = s_c(m, \theta_c) / \int_0^1 s_c(m, \theta_c) d\theta_c$. The posterior beliefs on the equilibrium path can be characterized, given the strategies above. If A attacks, then $\mu_a(\theta_a|att) = 1/(1 - \theta_a^*(m))$ if $\theta_a \geq \theta_a^*(m)$, otherwise $\mu_a(\theta_a|att) = 0$. If A does not attack, then $\mu_a(\theta_a|\sim att) = 1/\theta_a^*(m)$ if $\theta_a < \theta_a^*(m)$, otherwise $\mu_a(\theta_a|\sim att) = 0$. If B retaliates, then $\mu_b(\theta_b|ret) = 1/(1 - \theta_b^*(m))$ if $\theta_b \geq \theta_b^*(m)$, otherwise $\mu_b(\theta_b|ret) = 0$. If B does not retaliate, then $\mu_b(\theta_b|\sim ret) = 1/\theta_b^*(m)$ if $\theta_b < \theta_b^*(m)$, otherwise $\mu_b(\theta_b|\sim ret) = 0$.

Given the beliefs about C 's type, $\mu_c(\theta_c|m)$, if C intervenes, then $\mu_c(\theta_c|m, MUWAR) = \mu_c(\theta_c|m) \cdot s_c(\theta_c, m) / \int_0^1 \mu_c(\theta_c|m) \cdot s_c(\theta_c, m) d\theta_c$; if C does not intervene, then $\mu_c(\theta_c|m, BIWAR) = \mu_c(\theta_c|m) \cdot (1 - s_c(\theta_c, m)) / \int_0^1 \mu_c(\theta_c|m) \cdot (1 - s_c(\theta_c, m)) d\theta_c$.

Along the equilibrium path, the Bayesian rule defines beliefs, but the rule does not tell us what nations should believe if they observe an action that should not occur in equilibrium. The assumptions we make off the equilibrium path are important because they affect incentives. The standard refinements (Banks 1991, 14–7) rely on finding the type with the largest incentive to deviate from the equilibrium path; players believe that the out-of-equilibrium message (action) is sent by this type. I use this intuition to define out-of-equilibrium beliefs. If nations take aggressive actions (A attacks), B retaliates) out of equilibrium, then they are

believed to be the highest type, $\theta_i = 1$. I assume that the lowest types take out-of-equilibrium passive actions (A does not attack, B does not retaliate, C does not intervene). These refinements are important for constructing the example, but no propositions rely on these assumptions. Note that C 's type is revealed if it fights, so beliefs are well defined if a multilateral war occurs.

Proof of Proposition 2. Given any set of beliefs, $\mu_a(\theta_a)$, $\mu_b(\theta_b)$ and $\mu_c(\theta_c|m)$, domestic reelection makes C more likely to intervene than international factors alone predict: $d\gamma(m)/d\Psi \geq 0$.

Proof: C is indifferent about intervening if

$$\int_0^1 \int_0^1 \mu_a(\theta_a|att) \mu_b(\theta_b|ret) [p(\Theta) - q(\Theta)] d\theta_a d\theta_b - k_c \\ + \Psi(\Phi(E[\theta_c|m, MUWAR]) - \Phi(E[\theta_c|m, BIWAR])) = 0.$$

Given C 's strategy, $s_c(\theta_c, m(\theta_c))$, $E[\theta_c|m, BIWAR] = \int_{\theta_c^*(m)}^1 \mu_c(\theta_c|m) \theta_c d\theta_c$. If C intervenes, then, by assumption, its competence is revealed, $E[\theta_c|m, MUWAR] = \theta_c$. Therefore, $E[\theta_c|m, MUWAR] - E[\theta_c|m, BIWAR] > 0$. Since $\Psi > 0$, and Φ is increasing in expected competence, then $\Psi(\Phi(E[\theta_c|m, MUWAR]) - \Phi(E[\theta_c|m, BIWAR])) > 0$. Notice that this is true even if we relax the assumption that C 's type is revealed when a war occurs. If C 's type is not revealed, then $E[\theta_c|m, MUWAR] = \int_{\theta_c^*(m)}^1 \mu_c(\theta_c|m) \theta_c d\theta_c > E[\theta_c|m, BIWAR]$.

If domestic politics is unimportant, that is, either $\Psi = 0$ or $\Phi(\cdot)$ is constant in $E[\theta_c|m, z]$, then the type θ_c that satisfies the above equality is higher than the type that satisfies the equality if domestic politics matters. Therefore, domestic reelection makes leaders more hawkish. Q.E.D.

PROPOSITION 3. For any $\mu_c(\theta_c|m)$, if a change in an exogenous parameter increases the probability that C intervenes, then it (weakly) decreases the probability that A attacks: $(d\alpha(m)/d\gamma(m)) \leq 0$, where α and γ are differentiable.

Proof: But suppose not. Suppose a change in an exogenous variable, such as bias or Ψ , increases the probability of intervention and increases the probability of initiation: $\gamma'(m) > \gamma(m)$ and $\alpha'(m) > \alpha(m)$.

(1) Consider B 's decision to retaliate. $\alpha'(m) > \alpha(m)$ implies that $\theta_a^*(m)' > \theta_a^*(m)$. Therefore, if A attacks, then on average B fights a less competent type if it resists. In addition, since some types of C intervene that previously did not, and $p(\Theta) > q(\Theta)$, B 's payoff for resisting strictly increases:

$$U_b(ret|\theta_b, m)' = \int_{\theta_b^*(m)'}^1 \left(\int_{\theta_c^*(m)'}^1 \mu_c(\theta_c|m) p(\Theta) d\theta_c \right. \\ \left. + (1 - \gamma(m)) q(\Theta) d\theta_a - k_b \right) > U_b(ret|\theta_b, m) \\ = \int_{\theta_b^*(m)}^1 \left(\int_{\theta_c^*(m)}^1 \mu_c(\theta_c|m) p(\Theta) d\theta_c \right. \\ \left. + (1 - \gamma(m)) q(\Theta) d\theta_a - k_b \right).$$

B 's payoff if it surrenders is 0. Therefore, the type that is indifferent about retaliating is lower, that is, $\theta_b^*(m)' \leq \theta_b^*(m)$, which implies $\beta(m)' \geq \beta(m)$.

(2) Consider A 's decision. In some cases in which B previously backed down, it now fights back. In addition, in some of these wars C now intervenes, whereas previously it did not. Therefore, A 's value from attacking is reduced, as

more often aggression ends in war, and more often these wars are multilateral rather than bilateral. Hence, $U_a(att|\theta_a, m)$ decreases for all θ_a . But $U_a(\sim att|\theta_a, m)$ is constant for all changes in $\theta_c^*(m)$ and $\theta_b^*(m)$. Therefore, the type that is indifferent about attacking is higher following the exogenous change: $\theta_a^*(m)' \geq \theta_a^*(m)$, which implies $\alpha(m)' \leq \alpha(m)$. This contradicts the initial supposition that $\alpha(m)' > \alpha(m)$. *Q.E.D.*

LEMMA 1: *In equilibrium, each nation's expected utility is a weakly increasing, continuous monotone in its type.*

Proof: I consider only nation C; the proofs for A and B are analogous.

(i) First show that $U_c(\theta_c, m(\theta_c))$ is weakly increasing in θ_c .

$$U_c(\theta_c, m(\theta_c)) = 1 - \alpha(m(\theta_c)) \\ + (1 - \alpha(m(\theta_c))\beta(m(\theta_c)))\Psi\Phi(E[\theta_c|m(\theta_c)]) \\ + \zeta(\theta_c, m(\theta_c)),$$

where

$$\zeta(\theta_c, m(\theta_c)) = \text{MAX} \left\{ \int_{\theta_a^*(m(\theta_c))}^1 \int_{\theta_b^*(m(\theta_c))}^1 p(\Theta) d\theta_a d\theta_b - k_c \right. \\ \left. + \Psi\Phi(\theta_c'), \int_{\theta_a^*(m(\theta_c))}^1 \int_{\theta_b^*(m(\theta_c))}^1 q(\Theta) d\theta_a d\theta_b \right. \\ \left. + \Psi\Phi(E[\theta_c|m(\theta_c), \text{BIWAR}]) \right\}.$$

Since $p(\Theta)$ is increasing in θ_c and $p(\Theta) > q(\Theta)$, $\zeta(\theta_c, m(\theta_c))$ is weakly increasing in θ_c . Consider two types, $\theta_c' < \theta_c$. If type θ_c' mimics type θ_c , then its payoff is at least as good as the lower types: $U_c(\theta_c', m(\theta_c')) \geq U_c(\theta_c', m(\theta_c))$. Therefore, $U_c(\theta_c', m(\theta_c')) \geq U_c(\theta_c', m(\theta_c'))$.

(ii) Second, show that $U_c(\theta_c, m(\theta_c))$ is a continuous function in θ_c . Consider any two arbitrary types, θ_c and θ_c' , where $\theta_c' = \theta_c + \epsilon$. In equilibrium, $U_c(\theta_c', m(\theta_c')) \geq U_c(\theta_c, m(\theta_c))$, and $U_c(\theta_c, m(\theta_c)) \geq U_c(\theta_c, m(\theta_c'))$. As $\epsilon \rightarrow 0$, $\zeta(\theta_c, m(\theta_c)) \rightarrow \zeta(\theta_c', m(\theta_c'))$, and $\zeta(\theta_c, m(\theta_c')) \rightarrow \zeta(\theta_c', m(\theta_c'))$. Therefore, as $\epsilon \rightarrow 0$, $U_c(\theta_c', m(\theta_c')) \rightarrow U_c(\theta_c, m(\theta_c))$. This implies that $U_c(\theta_c, m(\theta_c))$ is continuous. *Q.E.D.*

LEMMA 2: *If $s_c(\theta_c', m(\theta_c')) = 0$, then for all $\theta_c < \theta_c'$ either (i) $\alpha(m(\theta_c))\beta(m(\theta_c)) = 0$, or (ii) $s_c(\theta_c, m(\theta_c)) = 0$.*

Proof: Consider the type θ_c' , which does not intervene given its equilibrium message $m(\theta_c')$. Now consider another type, $\theta_c'' < \theta_c'$, which sends the equilibrium message $m(\theta_c')$ with positive probability. Suppose that, given this message, war occurs with positive probability, $\alpha(m(\theta_c''))\beta(m(\theta_c'')) > 0$. If type θ_c'' mimics type θ_c' , then $U_c(\theta_c'', m(\theta_c')) = U_c(\theta_c'', m(\theta_c'))$, because neither type intervenes given the message $m(\theta_c')$, ($\theta_c'' < \theta_c' < \theta_c^*(m(\theta_c'))$).

Having sent its equilibrium message $m(\theta_c'')$, suppose that type θ_c'' will intervene if a war occurs. The expected payoff for θ_c'' is

$$U_c(\theta_c'', m(\theta_c'')) = \theta_a^*(m(\theta_c'')) + \int_{\theta_a^*(m(\theta_c''))}^1 \int_{\theta_b^*(m(\theta_c''))}^1 p(\Theta) d\theta_a d\theta_b \\ - k_c + \alpha(m(\theta_c''))\beta(m(\theta_c''))\Psi\Phi(\theta_c'') + (1 \\ - \alpha(m(\theta_c''))\beta(m(\theta_c'')))\Psi\Phi(E[\theta_c|m(\theta_c''), \text{MUWAR}]) .$$

Because $p(\Phi)$ is increasing in θ_c , type θ_c' receives a higher payoff than θ_c'' if it sends message $m(\theta_c')$ and intervenes should a war occur, $U_c(\theta_c', m(\theta_c')) > U_c(\theta_c'', m(\theta_c'))$. Since $m(\theta_c')$ is an equilibrium message for type θ_c' , $U_c(\theta_c', m(\theta_c')) \geq U_c(\theta_c'', m(\theta_c'))$. Given that $U_c(\theta_c', m(\theta_c')) = U_c(\theta_c'', m(\theta_c'))$, this implies $U_c(\theta_c', m(\theta_c')) > U_c(\theta_c'', m(\theta_c'))$, but this is a contradiction of lemma 1. *Q.E.D.*

LEMMA 3: *If there exists an equilibrium message m' such that $\alpha(m') = 0$, then either (i) all messages are uninformative, or (ii) there exists an alternative message m'' , such that $\alpha(m'') > 0$, and $E[\theta_c|m''] > E[\theta_c|m']$.*

Proof: Consider an alternative message m'' . There are three cases:

- (1) $\alpha(m'') = 0$,
- (2) $\alpha(m'') = 1$, $\beta(m'') = 0$, and
- (3) $\alpha(m'')\beta(m'') > 0$.

Consider (1). $U_c(\theta_c, m') = 1 + \Psi\Phi(E[\theta_c|m'])$ and $U_c(\theta_c, m'') = 1 + \Psi\Phi(E[\theta_c|m''])$ for all θ_c . Therefore, if both messages are sent in equilibrium, then $E[\theta_c|m'] = E[\theta_c|m'']$, and messages are uninformative.

(2) $U_c(\theta_c, m') = 1 + \Psi\Phi(E[\theta_c|m'])$, and $U_c(\theta_c, m'') = \Psi\Phi(E[\theta_c|m''])$. Therefore, $E[\theta_c|m''] > E[\theta_c|m']$.

(3) $U_c(\theta_c, m'') = 1 - \alpha(m'') + (1 - \alpha(m'')\beta(m''))\Psi\Phi(E[\theta_c|m'']) + \alpha(m'')\beta(m'')\text{MAX}\{\bar{q}(\Theta) + \Psi\Phi(E[\theta_c|m'']), \bar{p}(\Theta) - k_c + \Psi\Phi(E[\theta_c|m'']), \text{MUWAR}]\}$, where $\bar{q}(\Theta)$ and $\bar{p}(\Theta)$ represent the average value for type θ_c of bilateral and multilateral wars, respectively. Given $s_c(\theta_c, m)$ or the out-of-equilibrium beliefs, $E[\theta_c|m''], \text{BIWAR}] \leq E[\theta_c|m'']$. Since $\text{MAX}\{\bar{q}(\Theta), \bar{p}(\Theta) - k_c\} < 1$ for all Θ , $U_c(\theta_c, m'') \geq U_c(\theta_c, m')$ for some θ_c , which implies that $E[\theta_c|m''] > E[\theta_c|m']$. *Q.E.D.*

LEMMA 4: *If there exists an equilibrium message m' such that $\beta(m') = 0$, then either (i) all messages are uninformative, or (ii) (nongeneric case) there exists an alternative message m'' such that $\alpha(m'') = 0$, $\beta(m'') > 0$ and $E[\theta_c|m''] < E[\theta_c|m']$ or (iii) there exists an alternative message m'' , such that $\alpha(m'') > 0$, $\beta(m'') > 0$, and $E[\theta_c|m''], \text{BIWAR}] < E[\theta_c|m']$.*

Proof: Consider an alternative message m'' . There are three cases:

- (1) $\beta(m'') = 0$,
- (2) $\alpha(m'') = 0$, $\beta(m'') > 0$, and
- (3) $\alpha(m'')\beta(m'') > 0$.

Consider (1). Note that $\beta(m'') = 0$ implies $\alpha(m'') = 1$. $U_c(\theta_c, m') = \Psi\Phi(E[\theta_c|m'])$, and $U_c(\theta_c, m'') = \Psi\Phi(E[\theta_c|m''])$ for all θ_c . Therefore, if both messages are sent in equilibrium, then $E[\theta_c|m'] = E[\theta_c|m'']$, and messages are uninformative.

(2) $U_c(\theta_c, m') = \Psi\Phi(E[\theta_c|m'])$, and $U_c(\theta_c, m'') = 1 + \Psi\Phi(E[\theta_c|m''])$. If both messages are sent in equilibrium, then $U_c(\theta_c, m') = U_c(\theta_c, m'')$. Therefore, $E[\theta_c|m'] - E[\theta_c|m''] = 1/\Psi$. Note that this case is nongeneric.

(3) $U_c(\theta_c, m') = \Psi\Phi(E[\theta_c|m'])$ for all θ_c . Consider the payoff associated with message m'' : $U_c(\theta_c, m'') = 1 - \alpha(m'') + (1 - \alpha(m'')\beta(m''))\Psi\Phi(E[\theta_c|m'']) + \alpha(m'')\beta(m'')\text{MAX}\{\bar{q}(\Theta) + \Psi\Phi(E[\theta_c|m'']), \bar{p}(\Theta) - k_c + \Psi\Phi(E[\theta_c|m'']), \text{BIWAR}]\}$, where $\bar{q}(\Theta)$ and $\bar{p}(\Theta)$ represent the average value for type θ_c of bilateral and multilateral wars, respectively.

Case a: Suppose that having sent message m'' , some types do not intervene: For some θ_c , such that $s_c(m'', \theta_c) > 0$, $s_c(\theta_c, m'') < 1$. Thus, $U_c(\theta_c, m'') = 1 - \alpha(m'') + \alpha(m'')\beta(m'')\bar{q}(\Theta) + (1 - \alpha(m'')\beta(m''))\Psi\Phi(E[\theta_c|m'']) + \alpha(m'')\beta(m'')\Psi\Phi(E[\theta_c|m'']), \text{BIWAR}] = \Psi\Phi(E[\theta_c|m''])$.

Since $\bar{q}(\Theta) > 0$, $(1 - \alpha(m'')\beta(m''))\Phi(E[\theta_c|m'']) + \alpha(m'')\beta(m'')\Phi(E[\theta_c|m'']), \text{BIWAR}] < \Phi(E[\theta_c|m'])$.

Given $s_c(\theta_c, \cdot)$, $E[\theta_c|m''] \geq E[\theta_c|m'', BIWAR]$. This implies that $E[\theta_c|m'', BIWAR] < E[\theta_c|m']$.

Case b: Suppose that having sent message m'' , all types intervene: For all θ_c , such that $\sigma_c(m'', \theta_c) > 0$, $s_c(\theta_c, m'') = 1$. Let $\underline{\theta}_c$ be the smallest θ_c that sends m'' and intervenes. Since C 's expected payoff, $U_c(\theta_c, m'') = 1 - \alpha(m'') + (1 - \alpha(m'')\beta(m''))\Psi\Phi(E[\theta_c|m'']) + \alpha(m'')\beta(m'')(\bar{p}(\Theta) - k_c + \Psi\Phi(\theta_c))$, is strictly increasing in θ_c , $U_c(\underline{\theta}_c, m'') \geq U_c(\theta_c, m')$. Therefore, $\sigma_c(m'', \underline{\theta}_c) > 0$, and $s_c(\theta_c, m'') = 1$ implies that if $\sigma_c(m', \theta_c) > 0$, then $\theta_c \leq \underline{\theta}_c$. Therefore, $E[\theta_c|m'] \leq \underline{\theta}_c < E[\theta_c|m'']$. $U_c(\underline{\theta}_c, m'') \geq U_c(\theta_c, m')$ implies

$$1 - \alpha(m'') + (1 - \alpha(m'')\beta(m''))\Psi\Phi(E[\theta_c|m'']) \\ + \alpha(m'')\beta(m'')(\bar{p}(\Theta) - k_c + \Psi\Phi(\theta_c)) \\ - \Psi\Phi(E[\theta_c|m']) \geq 0.$$

Thus, $1 - \alpha(m'') + \alpha(m'')\beta(m'')(\bar{p}(\Theta) - k_c) < 0 \Rightarrow \bar{p}(\Theta) - k_c < 0$. Yet, since $\underline{\theta}_c$ intervenes, $\bar{p}(\Theta) - k_c + \Psi\Phi(\underline{\theta}_c) \geq \bar{q}(\Theta) + \Psi\Phi(E[\theta_c|m'']), BIWAR]$. This implies that $E[\theta_c|m''] > E[\theta_c|m'] > E[\theta_c|m'', BIWAR]$. Q.E.D.

An Informative Equilibrium. In the informative equilibrium, if C is a type above θ_c^* , then it sends message $m_1 \in M_1$ and intervenes if a war occurs. If C is a low type, $\theta_c < \theta_c^*$, then it sends message $m_2 \in M_2$ and does not intervene if a war occurs. If a unilateral war occurs, then the voters learn C 's type. If C sends message m_1 , then the voters believe that its average competence is $E[\theta_c|m_1] = (1 + \theta_c^*)/2$. This is greater than the average competence of C if message m_2 is sent, $E[\theta_c|m_2] = \theta_c^*/2$. Yet, since types that send message m_2 do not intervene, C pays no domestic political cost for not intervening. Types that send message m_1 pay a huge domestic political cost for not intervening if a war occurs because voters believe them to be completely incompetent.

More formally, the following strategy profile $(\sigma_c, s_a, s_b, s_c)$ and beliefs (μ) constitute a sequential equilibrium if there exists $\theta_c^* \in (0, 1)$ that satisfies equations 1 and 2 below:

For any $m_1 \in M_1$ and $m_2 \in M_2$, such that $M_1 = M \setminus M_2$, $\sigma_c(m_1, \theta_c) > 0$ if $\theta_c \geq \theta_c^*$, $\sigma_c(m_1, \theta_c) = 0$ otherwise; $\sigma_c(m_2, \theta_c) > 0$ if $\theta_c < \theta_c^*$, $\sigma_c(m_2, \theta_c) = 0$ otherwise; $s_i(\theta_i, m_1) = 1$ if $\theta_i \geq \theta_i^*(m_1)$, $s_i(\theta_i, m_1) = 0$ otherwise; and $s_i(\theta_i, m_2) = 1$ if $\theta_i \geq \theta_i^*(m_2)$, $s_i(\theta_i, m_2) = 0$ otherwise for $i = a, b, c$, where $\theta_i^*(m)$ satisfies the definitions in proposition 1, and μ represents posterior Bayesian beliefs.

$$\theta_c^*(m_1) \leq \theta_c^* \leq \theta_c^*(m_2); \text{ and} \quad (1)$$

$$U_c(\theta_c^*, m_1) = U_c(\theta_c^*, m_2). \quad (2)$$

Proof: The beliefs of the players, given their strategies, were characterized above. The optimal strategies, given these beliefs, are uniquely characterized in proposition 1. In characterizing $\theta_c^*(m_1)$, I assume the out-of-equilibrium belief refinement that the type which does not intervene having sent message m_1 is $\theta_c = 0$.

Given that s_i are optimal strategies, all that remains is to show that C 's message-sending strategy is optimal. If type θ_c sends message m_2 and does not intervene if a war occurs, then its expected payoff is $U_c(\theta_c, m_2) = 1 - \alpha(m_2) + \int_{\theta_c^*(m_2)}^1 \int_{\theta_b^*(m_2)}^1 q(\Theta) d\theta_a d\theta_b + \Psi[\Phi(\theta_c^*/2)]$. Given equation 1, if C sends message m_2 , then its payoff is constant in θ_c . If C sends message m_1 and intervenes, however, then its payoff, $U_c(\theta_c, m_1) = 1 - \alpha(m_1) + \int_{\theta_c^*(m_1)}^1 \int_{\theta_b^*(m_1)}^1 (p(\Theta) - k_c) d\theta_a d\theta_b + \Psi[(1 - \alpha(m_2)\beta(m_2))\Phi((1 + \theta_c^*)/2) + \alpha(m_2)\beta(m_2)\Phi(\theta_c)]$, is strictly increasing in θ_c . If equations 1 and 2 hold, then $\sigma_c(m, \theta_c)$ is utility maximizing, given the strategies of the other players. Q.E.D.

Figure 4 showed a numerical example of an informative equilibrium.

Hugo Grotius on Ethics and War

STEVEN FORDE *University of North Texas*

Interest in the thought of Hugo Grotius on international law and ethics is justified inasmuch as he attempted to define a theoretical position between an idealism he thought counterproductive and an amoral realism he found unacceptable. Grotius constructed a system in which the moral authority of natural law was combined with the flexibility of human law. This required him to develop a special understanding of the nature and relation of these two types of law. In giving the law of nations, as a product of human will, the authority to suspend provisions of natural law, he provided for a code of international conduct that could permit injustice where necessary, without abandoning moral ideals altogether.

A certain ambivalence hovers today over the legacy of Hugo Grotius. The publication in 1625 of his great work, *The Law of War and Peace* (*De Jure Belli ac Pacis*), almost immediately brought him great renown throughout Europe, and for perhaps two centuries thereafter Grotius was considered authoritative not only in the fields of international law and ethics but also in natural law and moral philosophy generally. Then his reputation suffered a severe decline, due to the rise of positivism in international law and the disfavor of natural law thinking in moral philosophy. During the late twentieth century, Grotius's stock has risen again, at least in the fields of international relations and international law. In the latter, the intellectual force of positivism has been blunted by renewed appeals to objective moral principles, such as human rights. In the former, Grotius has been made the eponym of a general approach said to be a pragmatic mean between amoral Machiavellianism and idealistic Kantianism (Bull 1990; 71–2; Wight 1966, 89; cf. Lauterpacht 1985, 12).

Renewed interest in Grotius is appropriate today, inasmuch as the issues with which he grappled are permanent problems of foreign policy and ethics. In his approach to these problems, Grotius did indeed try to define a middle position between raw realism and the idealism of much of the natural law tradition. *The Law of War and Peace* represents not just a catalog of the provisions of natural law and the law of nations on a wide variety of subjects; it is an ambitious attempt to forge a theoretical system that can account for these two types of law and define their relationship. This system exhibits sufficient flexibility to take account of historically variable state practice, reflected in the law of nations, while retaining a grounding in the unchanging moral principles of natural law. My interest is in seeing how, or whether, Grotius succeeds in weaving these two principles into a just yet flexible code of international behavior.

Grotius's motives in attempting this synthesis are similar to those that drive much of current writing about international ethics. He tells us of his desire to

combat the age-old view that there is no justice, or no justice in the relations of states.¹ He is also moved by horror at the savagery of the wars fought in Europe in the decades before his writing, wars motivated largely by religion. "Throughout the Christian world," he laments, "I observed a lack of restraint in relation to war, such as even barbarous races would be ashamed of . . . it is as if, in accordance with a general decree, frenzy had openly been let loose for the committing of all crimes" (*Prol.* 28, p. 20). Consequently, some were led to make the extreme claim that Christianity forbids all use of arms, says Grotius, but however pure their motives, these writers actually undermine the prospects for restraint by going too far in the opposite direction. Their extremism only discredits reasonable moral argument and robs morality of what effect it might have on practice. "For both extremes therefore a remedy must be found," he concludes, "that men may not believe either that nothing is allowable, or that everything is" (*Prol.* 29, p. 20). Excessive idealism only marginalizes itself; a more responsible approach must begin by making peace with certain uncomfortable realities.

We must always remember that Grotius's search for a middle path between realism and idealism is motivated by an essentially moral concern. His desire is for an *effective* set of moral restraints on states. This is what he tries to create by combining natural law with the more flexible institution of positive law, rooted in human volition. The resulting mixture anticipates the development of modern right *per se*, a development with which Grotius would only partially agree.

THE FOUNDATION AND POWER OF NATURAL LAW

Contemporary students of political philosophy may know of Grotius only through Rousseau's highly visible attack. In the opening chapters of *On the Social*

Steven Forde is Associate Professor of Political Science, University of North Texas, Denton, TX 76203.

Work on this essay was greatly facilitated by grants from the John M. Olin Foundation and from the National Endowment for the Humanities.

¹ *Law of War and Peace, Prolegomena* 3, p. 9. Hereafter, citations to this work will be either to the *Prol.* or by book, chapter, and section number, with page references to the Carnegie Endowment translation (Grotius [1625] 1925). Quotations are from that translation. My treatment of Grotius's thought will rely exclusively on this work. His earlier *De Iure Praedae Commentarius* (*Commentary on the Law of Prize*) (Grotius [1604] 1950) differs in some significant respects from the *Law of War and Peace*, so attempts to draw on it might cloud rather than clarify matters. One discussion of the differences between these two works can be found in Tuck 1993, chapter 5.

Contract, Rousseau ([1762] 1978, I.2, 4, 5; II.2) repeatedly rebukes Grotius for being a defender of slavery, both individual and collective, and a flatterer of tyrants. Grotius does take the position Rousseau describes, but for complicated reasons. He believes that slavery and absolutism are the exception rather than the rule, and even somehow against nature, but they can become legitimate under certain circumstances. They are important examples of one type of flexibility that Grotius finds in the interplay of natural and human law.

Following his predecessors in the natural law tradition, Grotius finds the root of natural law in human nature, which is "the mother of the law of nature" (*Prol.* 16, p. 15); natural law commands us to follow precepts that accord most with our true nature.² On Cicero's authority, Grotius (I.1.3, 34; I.2.1, 51–4, and *passim*) asserts that that nature is essentially social and rational. But unlike Cicero, Grotius construes the law that flows from this in a very restricted or minimalist way. Referring to the title of his treatise, he says (I.1.3, 34) that he uses the word *law* (*ius*) in a negative rather than an affirmative sense: whatever is not unjust is just. When he later limits the unjust to what is "utterly repugnant" to rational and social nature (I.2.1, 52), the requirements of justice seem to have been made as minimal as can be. Grotius's natural law bars only clear, positive injustices, acts that are unambiguously destructive of society. It is directed only to the bare preservation of social peace (Bull 1990, 78; Haakonssen 1985, 242–3; Tuck 1979, 73).

Grotius is taking issue with almost the whole of the late classical and Christian tradition of natural law. He acknowledges that some have declared all honorable things, and all of virtue, to be part of the natural law, but he is adamant that this is a misuse of the term (I.1.10, 39; cf. Kingsbury 1997, 30). For the Christians, indeed, natural law was a counsel of perfection, encompassing all the natural and perhaps even the supernatural virtues (Fortin 1996a, 206–10). The classical doctrine was likewise connected to a notion of higher perfection. Grotius follows Cicero in separating lower and higher principles of our nature and in stipulating that the duties coming from the higher principles, sociability and rationality, are more authoritative (I.2.1, 51). But it becomes clear rather early in the *Law of War and Peace* that Grotius does not mean this in the same way as his classical predecessor (Tuck 1993, 159). For Cicero and the Stoics, who fit broadly within the Socratic tradition in classical political thought, the precepts of rational nature form the basis of a moral

outlook that is highly perfectionist and culminates in a form of rational justice that cannot be fully realized in any actual political order (Cicero 1975, 281–5). Grotius reinterprets natural law in such a way as to downplay if not remove entirely the higher reaches of the classical doctrine. In his opening outline of the various meanings of justice, Grotius adopts Aristotle's (1977) distinction between contractual justice (which he calls "expletive justice," *iustitia expletrix*), and distributive justice ("attributive justice," *iustitia attributrix*; I.1.8, 36–7). The first is based purely on legal possession, while the second relies on differential individual merit (in Aristotle's example, the flute is properly his who can use it best; *Politics* 1282b32–1283a3). For Aristotle, the second is clearly higher, though the first is obviously necessary for political order. Grotius, however, says that only the first is justice properly speaking (I.1.8, 36–7; see Tuck 1979, 68, 75, and 1993, 196–7). He acknowledges the second as part of morality, but not of justice (I.1.8, 37; I.1.7, 36; I.1.4, 35; I.1.9, 38).

Grotius in effect upbraids Aristotle for failing to see that justice is of this minimal nature. He is fully aware of the classical argument that the function of rational justice is preeminently to establish a proper distribution of goods in accordance with merit, but he is explicit in rejecting it: "Long ago the view came to be held by many, that this discriminating allotment is a part of *ius*, properly so called; nevertheless *ius*, properly defined, has a far different nature, because its essence lies in leaving to another that which belongs to him, or in fulfilling our obligations to him" (*Prol.* 10, p. 13). Grotius approvingly relates the well-known tale from Xenophon's *Cyropaideia* in which the young Cyrus is whipped for exchanging the cloaks of a large and a small boy. Cyrus took justice to be natural fit rather than legal or conventional ownership, but he was mistaken: Justice considers only the legal property rights of each (I.1.8, 37). The role of the legislator is to protect these, not to correct or improve upon them: "Society has in view this object, that through community of resource and effort each individual be safeguarded in the possession of what belongs to him" (I.2.1, 53). Justice has to do fundamentally with possessions or property, and it is determined by what one has rather than any notion of what one should have or deserves to have. Politics is thereby shorn of what used to be regarded as its higher and truest purpose.

This parsimonious understanding of justice is one reason Grotius gives a central place to "subjective right." He is often seen as a forerunner if not a pioneer of modernity in the emphasis he places on rights inhering in the individual, rather than "objective right," or justice defined with reference to some objective state of affairs.³ Under the latter view, characteristic of

² Olivecrona (1971, 14–16) asserts the weakness of this inference from nature to duty ("the naturalistic fallacy") and infers as a result that Grotius's true argument must be that we are bound by God's authority, as the author of human nature (cf. Finnis 1980, 44; Olivecrona 1977, 79, 100–1). He then concludes that, *pace* many interpreters, Grotius's theory is in no way secular. I do not follow this reading, since Grotius gives no sign of believing the inference from nature to be a fallacy (cf. Rabkin 1997, 297). According to John Finnis, Aquinas also based right on this fallacy, if it is a fallacy (Finnis 1980, 46). Indeed, Olivecrona (1971, 17) continues that, on his understanding, there is no reason we should be bound by God's command any more than by conformity to nature, apparently leaving no basis for duty at all.

³ The concept of subjective right was not new with Grotius. It has been discerned in various medieval authors, and especially in the late scholastic Suárez ([1612] 1944), who briefly preceded Grotius (Haakonssen 1996, 23; Nederman 1996; Villey 1964). Grotius's innovation consists not only in the decisive preference he gives to subjective right but also in the minimal interpretation he imposes on it. This strongly points to modern theories of individual right. See Finnis 1980, 206; Haakonssen 1985, 240; Kingsbury 1997, 17; Rabkin 1997; Tuck 1979.

the classical and Thomistic approaches, the task of politics is to arrange society in accordance with an objectively ascertained just order, which is ultimately a suprapolitical order (Villey 1964, 120). This view has an obvious kinship with the perfectionist notion of right as fit or merit, though Grotius argues, interestingly, that both objective and subjective right could be interpreted in a perfectionist manner (I.1.4, 35). He claims that perfectionist subjective right is what Aristotle called "worthiness" (ἀξία, I.1.7, 36), viewed as an entitlement of the individual. This is highly anachronistic, as doctrines of objective right classically viewed justice in terms of duty rather than entitlement (Strauss 1953, 146–8, 181), but it matters little, since Grotius goes on to assert that this is not true or "perfect" subjective right in any case. True subjective right is only the legal property right that he earlier identified as the basis of justice strictly so called (I.1.4, 35). Social justice is thus the sum of entirely adventitious claims of individual right, not adherence to any objective "just order" (see Villey 1962, chapter 11). This outlook was shared by many of Grotius's philosophical successors.

Once again, Grotius does not deny that virtues other than justice may inspire us to greater perfection, or that there are obligations to go beyond the minimal dictates of justice in our moral lives. But these are "imperfect" obligations, which men may not be compelled to honor except by a duly established human law (I.2.1, 52; cf. II.25.3, 580). Thus, laws have been passed in some states against waste, ingratitude, or idleness, going beyond what is strictly obligatory by nature. Previous natural law thinkers would have placed at least some of these duties within that law. But by shedding the perfectionism of the older outlook, Grotius gains a great deal of latitude. At a minimum, he avoids the mistake of the pacifists, who set overly high moral standards and thereby lost all influence over the actual behavior of states (*Prol.* 29, p. 20). By focusing attention on those precepts of natural law that he finds to be truly obligatory, Grotius gives them a better chance of actually being observed. For in addition to being fewer in number, these are necessarily the easiest to follow (I.1.10, 38–9; I.2.1, 52).

NATURAL LAW AND HUMAN LAW

Moral minimalism is not the only way Grotius creates greater flexibility to cope with the "realist" pressures of international politics and war. The precepts of natural law themselves come to have a remarkable adaptability in the *Law of War and Peace*, accommodating themselves in effect to the unfolding of human history. Grotius follows a long-standing tradition in identifying a precivil state when men lived without benefit of government. In part because of his belief in human sociability, Grotius does not treat this state as normative in the way that the later social contract theorists did. Yet, he agrees with them that the law of nature derives in some sense from this original condition. The result is a strangely ambivalent view of the status or authority of natural law.

The evolution of property is a key example. Grotius,

as did virtually every thinker before Locke, denies that property is established by natural law. Originally, he says, there was no private ownership; all was held in common, each taking whatever he needed for subsistence (I.1.10, 39; II.2.2, 186).⁴ This condition was necessarily a state of great simplicity and innocence (characterized by "ignorance of vices rather than knowledge of virtue," II.2.2, 187), for communism is not compatible with either an advanced state of society or of human development. It was necessarily abandoned, Grotius says, when men were no longer content to forage for food and live in caves, and when they turned to the development of the arts and other kinds of knowledge (II.2.2, 188–9). Yet, since communism was originally established by nature, Grotius maintains that it is according to natural law (I.1.9, 39). What then happened to this portion of the natural law in the human march toward civilization?

Grotius's answer is that it was not overthrown but in effect was modified, on behalf of private property. This modification was instigated by human action, specifically by the compact or agreement that established the convention of private property (II.2.2, 189). Grotius says that when men agreed among themselves to establish private property, natural law supported the new state of affairs: It dictated that the new form of property be respected (I.1.10, 39; II.14.8, 385; III.20.9, 808). In a sense, natural law bent to the will of man, though Grotius traces the accommodation to a principle deeper than communism or private property, a principle of providing for human sustenance. Common ownership was the appropriate means to this end in the primitive condition, just as private property is today (II.2.2, 186).⁵ Though natural law mandated a certain type of subsistence right in the beginning, it adapted itself to evolving human practices.

Slavery, one subject of Rousseau's attack on Grotius, is a more pointed case of natural law's modification. Grotius believes that men are naturally free: "Apart from a human act, or in the primitive condition of nature, no human beings are slaves" (III.7.1.1). He even admits that, "in this sense, it is correct to accept what was said by the jurists, that slavery is contrary to nature" and to natural law (III.7.1, 690). Nevertheless, he insists, this does not mean that the social institution of slavery is illegitimate (II.5.27, 255; II.22.11, 551). The reason, once again, is the primitiveness of the original condition to which this provision of the law of nature refers. Grotius suggests that condition was so

⁴ In a curious (though by no means unique) anticipation of Locke, Grotius says that, in this condition, when one man had taken something from the common for his own needs, it became unjust for another to take it from him (II.2.2, 186). He does not, however, make this the root of a natural right to property. For extensive discussions of Grotius's theory of property, see Buckle 1991, chapter 1; Olivecrona 1977.

⁵ This is also the foundation of the right to take others' property in extreme need. Grotius says that the original agreement on property must be understood to have a clause allowing such appropriation in cases of necessity, since its goal was to provide for human subsistence (II.2.6, 193). For a good discussion of the way private property flows from original communism by rational adaptation, see Buckle 1991, 9–13, 43–4.

primitive as to be virtually nonhuman. "For when liberty is said to be an attribute by nature of men and of peoples this must be understood of the law of nature which precedes all human conditions" (*jure naturae praecedente factum omne humanum*, II.22.11, 551). Why should civilized man be bound by a law adapted to such a condition? We are free by nature in the sense in which we are propertyless by nature, or indeed in which we are naked by nature (II.2.2, 187). If the original state is to be normative for society, we might as well conclude that we have a duty to remain unclothed. For the natural law to provide for both the primitive and the civilized condition, its provisions must be alterable, and some of its original precepts retired. In Grotius's view, natural liberty is one of these.

Grotius did not originate the notion that the provisions of the natural law, owing to their primitive origins, might be bent by civilized man. As indicated by his reference to the Roman jurists, cited above, the argument has late classical roots. Grotius the jurist was thoroughly familiar with Roman law, and cites the Roman legal writers more than any other sources in the *Law of War and Peace* (Zuckert 1994, 129). If one consults Justinian's *Institutes* on the subject of slavery, one finds in the opening chapters of Book One the assertion to which Grotius refers, that slavery is contrary to the law of nature (I.2, I.3, I.5). But the authors of that compilation then blandly assert that slavery has nevertheless been established by the law of nations (*ius gentium*; Justinian 1987, I.3, I.5). They offer no apology or explanation for this paradox. Its origin seems to lie in the way they understand the relation of the law of nations to the law of nature. The former is the set of practices settled upon by all or most nations. It is a common adaptation to common sets of circumstances (Justinian 1987, I.2), that is, to the common circumstances of developed society. For the jurists, its universal or near-universal character is testimony to the soundness or rationality of the adaptation. The law of nations can thus be interpreted as a law of reason, embodying reason's considered response to the (civilized) human condition (Justinian 1987, I.2). It arises in contradistinction to the law of nature, which derives fundamentally from the precivil condition. The law of nature, then, is primitive or incomplete, not fully adequate to the needs of men in society. The law of nature stands in need of supplementation, or even correction, by civilized man. The precepts of the law of nations, where they diverge from natural law, are therefore to be viewed as inventions of collective human reason to make civilized life possible. They may accordingly be placed above the law of nature, which is seen as primitive, low, or base. The law of nations, not the law of nature, provides for the needs of civil man.⁶

⁶ I follow the interpretation of the Juristic treatment of natural law proposed by Zuckert (1989), who argues that the philosophic orientation described is a deliberate response on the part of the Roman jurists to the challenge to positive law created by the philosophic notion of a natural law. In order to defuse this challenge, they interpreted natural law as primitive or low, and positive law (including the law of nations) as civilized and rational. (See also Buckle 1991, chapter 1; Kingsbury 1997, 30; Nussbaum 1950, 20.) Thinkers

Thus, like property and other institutions, slavery might paradoxically be justified as a requirement of civilized life under certain circumstances. Rousseau ([1762] 1978, III.15) himself conceded this once, noting (without attempting to resolve) the contradiction of this principle with the rest of his thought. Grotius might have accused Rousseau of thereby failing to confront honestly an important political and theoretical problem. Grotius might find an even deeper problem in Rousseau's account of natural law, which begins surprisingly like his own. Rousseau ([1755] 1964, 95–6), famously, prided himself on discovering the true ground of natural law in a supremely primitive condition. The state Rousseau claimed to discover could be described, with even more justice than that envisaged by Grotius, as "preceding all human conditions." Grotius and the Roman jurists ask the sensible question whether a condition so remote, remote in more than time, can be of sufficient relevance to society to provide absolute moral standards of the type for which Rousseau argues so vehemently (Fortin 1996b, 162). If not, simple reliance on the precepts of a natural law arising out of such a condition is neither theoretically nor practically satisfactory. Grotius argues that for natural law to be relevant to civilized man, it must adapt itself to his condition.

These adaptations, moreover, are triggered by human will. In contrast to the Roman jurists, Grotius grounds the law of nations squarely in volition or consent, rather than rationality *per se* (I.1.14, 44).⁷ Both slavery and private property, as institutions, are seen by him as products of compact. Rousseau maintained that human will is not competent to overcome natural freedom, but Grotius gives it greater power. Despite natural freedom, despite even the fact that liberty is part of the individual's "perfect" subjective right (I.1.5, 35), Grotius maintains that the individual is able to alienate his freedom, to give himself voluntarily into slavery. He admits that such a choice is base, unless motivated by some necessity, but insists that it is legitimate even if undertaken without good reason (II.5.27, 255). Absolute government, being a kind of collective slavery, is validated in the same way. All society, Grotius says, originates in a compact whose purpose is escape from the vulnerability of the precivil state (I.4.7, 149). But the compact itself can take many forms and need not provide for popular liberty. Peoples, like individuals, may contract themselves into slavery for any reason, or no reason (I.3.8, 103–4). They may even do so tacitly, for example, by acquiescing in a sovereignty taken by force (II.4.14, 229). And once such consent is given, it is irrevocable. Grotius

before Grotius had adopted in various ways the view that natural law may be modified by human practice, such as Thomas Aquinas (1952, 1a 2ae, 94.5) and Suárez ([1612] 1944, 2.14.6, 16, 17). The view was also common among Renaissance humanists (Tuck 1979, chapter 2).

⁷ The *ius gentium* for Grotius is properly speaking *only* a product of agreement, though the term, he notes, is sometimes used improperly to describe parts of the natural law as well (*Prol.* 16–17, p. 15; 40, p. 24). Here he diverges from Gentili ([1612] 1933, 8–10) and many of his other predecessors. For Grotius the set of norms binding on states, what we might call "international law," includes precepts of both the *ius gentium* and natural law.

does not shrink from following the logic of his position to the conclusion that a case may arise in which a foreign nation legitimately makes war to save a people from oppression, though the people have no right to revolt on their own behalf (II.25.8, 584). Natural law would be the basis of the the foreigner's right of "humanitarian intervention," but the oppressed have contracted their own right away.

Human choice is much less restricted by natural law in the creation of political order for Grotius than for many of the later contractarians. Grotius denies that sovereignty always resides in the people, or that government is ordained always for the benefit of the governed, principles that some had thought, and others would later think, to be binding on all societies (I.3.8, 103, 109). In his view, these are matters to be determined by the founding compact. It hardly needs to be pointed out that this does not mean all sovereignty is absolute. To the contrary, absolute power of the sort just described is probably a rarity. Grotius is explicit that most of the kings of his day do not hold absolute sovereignty,⁸ and in most states political power *has* been ordained for the benefit of the governed (I.3.8, 110). But the natural law, despite its favor for "natural liberty," does not prevent human beings from choosing other arrangements.

This is not to say that human will is completely unrestricted in its choice of social institutions, or that positive law receives its authority exclusively from will. Though Grotius claims in his treatise scrupulously to distinguish principles that come from nature and those that are part of positive law (*Prol.* 30, p. 21), the two are not completely distinct for him. In the case of property, natural law supports the arrangements of human will, lending its authority to the very institution that alters it. The same kind of authority is extended to all of human positive law by a provision Grotius finds in the natural law, commanding men to abide by promises. Thus, property, slavery, and the political constitution, as creatures of compact, all receive the sanction of natural law (II.11.1, 328–30; Olivecrona 1971, 13, 282). Grotius says that natural law sanctions agreements in this way because there is no other way men could establish obligation among themselves (*Prol.* 15, p. 14).

It might be fair to say that, for Grotius, natural law passes through the very refractive medium of human choice or will on the way to positive law, lending its authority to a very wide array of human arrangements that alter its original content.⁹ As Grotius says at one point, if human nature is the mother of natural law, it is only the "great-grandmother" of civil law (*Prol.* 16, p. 15). But just how refractive can this medium become?

⁸ He says that most of them hold their thrones "as if in usufruct," with various limitations on their power stemming from popular consent (III.20.5, 806).

⁹ This has led to the argument that the main role played by natural law in Grotius is to bolster human arrangements, through its principle *pacta sunt servanda* (Lauterpacht 1985, 17; Onuma 1993a). Zuckert (1994, chapter 5) argues that this combination of natural law and human agreement is what made Grotius so popular among seventeenth-century English Whigs. His natural law–based rationale for allegiance to a historically conditioned constitutional order fit their needs perfectly.

Are there any limits to how far or in what directions human agreement can bend natural law? In some cases, Grotius notes, human positive law forbids things merely discouraged by natural law. Here it may be said to tighten the moral laxity of the natural law. Thus, human law may mandate monogamy, while natural law allows polygamy (II.5.9, 234–5). In other cases, human law may decide questions left in suspense by natural law. The latter would permit ownership of some portions of the sea, but the law of nations has forbidden it (II.3.10, 210). Grotius also says that natural law limits ownership of property to those with reason, but the domestic law of many nations has overridden this limitation (II.3.6, 208). The same has happened to the natural law restricting the obligation of promises to those with reason (II.11.5, 332). Similarly, under natural law, only contracts equitable to both sides are valid, but the law of nations has made binding all formally valid contracts, "no matter how unfair" (II.19.6, 461; see II.12.26, 360). Natural law also countenances the punishment only of guilty individuals, but the nations have sanctioned reprisals and the "law of prize," whereby the goods of subjects can be seized for sovereign debts or as an act of war (III.2.1–2, 623–4). Finally, usucaption—title to property based merely on long possession, regardless of how it was originally acquired—is not recognized by natural law but has been established by the law of nations (II.4.2, 220; II.19.6, 461).¹⁰

With these last examples, we see human law becoming morally more permissive than natural law, perhaps even sanctioning violations of it. This would be highly questionable under traditional natural law doctrine, to say the least. Grotius takes care to point out why many of these exceptions to natural law were authorized by human law: If contracts or titles to property could be contested by anyone alleging the imperfect rationality of a contractor, the inequitable price of a commodity, or some ancient act of dispossession, there would be no end of domestic or international disputes (II.12.26, 361). Still, these cases do not seem to be like property and slavery, where natural law adapted itself to advancing human civilization. In order to account for them, we need to find a source of flexibility greater than any we have seen so far. Grotius finds such a source in the concept of "permissions."

"PERMISSIONS" AND THE LAW OF WAR

Grotius did not invent the notion of permissions under the natural law. Francisco Suárez, a late scholastic follower of Thomas Aquinas, discussed extensively whether human law could grant dispensations from the natural law, or "permissions" to violate it. In a treatise published only thirteen years before the *Law of War and Peace*, Suárez ([1612] 1944) acknowledges that this is allowable in a sense, but he follows Thomas in

¹⁰ Grotius does say that this right is "in some degree derived from the law of nature." Moreover, the law of nature generally prefers the status quo, for the sake of peace (II.4.7, 225), a principle that would strongly favor usucaption.

limiting it largely to permissions that are merely apparent violations of natural law. Suárez brings private property under this head, understanding its relation to natural law in much the same way as Grotius. The natural law recognizes variations in circumstances, and on those grounds it can be said loosely to suffer "exceptions" which in reality are not exceptions (Suárez [1612] 1944, II.13.7, 262, and II.14.6, 270). Since reason will acknowledge these exceptions, they are *ipso facto* within the natural law and are recognized as such by God (I.9.6, 109). Suárez is adamant, however, that human law cannot abrogate, or grant a dispensation from, any true precept of natural law, for human law gains authority only from its grounding in natural law (II.14.8, 272, and see I.9, 105, 107). Suárez follows Aquinas in viewing human law essentially as an implementation of natural law.

There is one important type of exception to this that Suárez grudgingly acknowledges. Since for him, as for his predecessors in the Christian natural law tradition, the natural law is a mandate of moral perfection, commanding all the virtues (Suárez [1612] 1944, II.20.3, 352), not all of its precepts can realistically be enforced by the political order. Thus, lying and many other vices condemned by natural law go largely unpunished under human law. In that sense, the human law can be said obliquely to grant "permissions" for such acts. When this happens, human law does not abrogate the natural law, but it does grant (earthly) impunity to its violation. Suárez (II.20.4, 353) acknowledges that we must concede this power to human law, but we must also be clear that this is an unfortunate concession to human frailty, a sign of the grave imperfection of the political order.

Since Grotius's theme is war, itself a monument to human imperfection, perhaps the impression is inevitable that his view of permissions is much more expansive than that of Suárez. As a matter of fact, Grotius takes the concept of permission and makes it central to his account of the law of nations and the law of war. The use he makes of permissions in the arena of international relations is so extensive as to raise with new urgency the question about the relative authority of natural and human law. Grotius gives human beings greater authority to suspend the operation of natural law, by agreement among themselves, than any in the Thomistic tradition would have been willing to grant.¹¹ We must remember also that the natural law from which permissions are granted is itself much more lax for Grotius than for the Thomists.

Grotius places the subject of permissions before our eyes from the beginning of his work, and he does not conceal their morally questionable character. In the *Prolegomena* he makes a sharp distinction between acts that are permitted and those that are genuinely free from fault (*Prol.* 35, p. 22; see III.4.2, 641–3). Again and again, he reminds us that the granting of permis-

sions does not make acts morally right (e.g., II.12.22, 358; II.12.26, 360; III.4.5, 645; III.7.6, 693; III.10.1, 716; III.10.3, 718–9). In the work's opening chapter, he says that a permission is not strictly speaking an operation of law or right at all, but a negation of its operation: It only suspends the action of a law under certain circumstances (I.1.9, 38). Somewhat later, he makes it clear that permissions may be extended to acts contrary to the law of nature, though such permissions are not "complete." They confer impunity but not a true moral liberty to perform the act in question (I.1.17, 49). Nonetheless, a permission does forbid others from hindering the act. Outside parties are effectively barred from enforcing whatever legal provision is addressed by the permission, even if it is a provision of the natural law.

In Book Two of the *Law of War and Peace*, Grotius says that human law cannot command what natural law forbids or forbid what that law commands (II.2.5, 192). But what kind of limit does this impose on human law? To begin with, it allows human law to forbid or command anything merely permitted by natural law or indifferent under it. Thus may polygamy be banned, though permitted by natural law. This kind of discretion was always allowed by natural law theory, as we saw earlier. Much more controversial is another possibility allowed by this formulation: Human law may permit an act forbidden by natural law (though it may not *command* it). Suárez conceded the necessity of this kind of operation, sometimes; but for him, to repeat, the natural law commanded perfection, not merely the "not unjust." This is not the case with Grotius, who in addition finds permissions that go considerably beyond such peccadillos as lying. Nor are such permissions uncommon: "The law of nations," he asserts at one point, "permits *many* things that are forbidden by the law of nature (III.4.15, 651–2; emphasis added). The result is nothing less than the sanctioning of injustice, often great injustice, in the conduct of war and elsewhere (see III.4.2, 642; III.4.15, 651–2, and generally the whole section on permissions in the law of war, III.2–III.9). Many of the rules having to do with the extent of belligerent violence, for example, and the treatment of prisoners of war are, according to him, the product of permissions against natural law. But the first and, as it were, the foundational compromise with justice in the law of war has to do with what should count as a legitimate cause of war, with who has a right to fight in the first place. In these matters, by Grotius's account, the law of nations has simply overthrown the notion of just war.

When speaking of the dictates of the law of nature in war, Grotius hews rather closely to traditional doctrine about just causes of war; he agrees that natural law dictates only one party (at most) in any war can be in the right (II.23.13, 565). It seems that any theory which takes seriously the notion of *ius ad bellum*, justice in the causes of war, must draw this conclusion. Yet, this entails that only one party in each war (at most, again) is authorized by justice to take up arms (II.1.18, 185;

¹¹ Outside the Thomistic tradition, arguments had been made that human law could grant genuine dispensations from the natural law. Suárez ([1612] 1944, II.14.1–4) addresses some of these arguments.

sec III.11.1, 722).¹² As to the other party, it must simply surrender without a fight (so long as its opponent fights within the rules of justice). It is enough to state this principle to see its futility as a practical norm for warfare. For this reason, traditional just-war doctrine fails the test of practicality proposed by Grotius in the *Prolegomena*, where he rejected pacifism on the grounds that it asks the impossible (*Proleg.* 29, p. 20). As Grotius points out, both sides in a war typically claim to be in the right. It is often difficult for third parties to make an independent judgment on the matter, and it is always dangerous to act on it (III.4.4, 644; III.9.4, 704). As a result, the law of nations has decreed that both combatants will be extended belligerent rights, such as the right to kill, the right to plunder, the right to acquire territory, so long as they abide by such purely formal requirements as public declarations of war by the sovereign power (*ibid.*; also I.3.4, 97; III.6.2, 664). Furthermore, the outcome of the struggle, whatever it may be, will be accorded legitimacy under the same minimal restrictions (III.9.4, 704). For the ideal of just war, the law of nations has substituted the institution of legal war.

What this signifies, of course, is a blanket permission for violations of natural law by unjust combatants, so long as they abide by certain formalities. For Grotius, it is important to understand why this has come about. It is not only that the just and unjust parties to a conflict are often difficult to make out. Peace itself requires the abandonment of just-war doctrine. If rigorously applied, this doctrine would occasion endless disputes over the validity of past victories or defeats, the legitimacy of existing boundaries, the proper extent of damages or reparations (Kosai 1993, 275; Tanaka 1993, 279, 306). Just as the law of nations has been forced to suspend the natural law requirements for the equity of contracts and the rationality of contractors in order to avoid endless lawsuits, it must abridge just-war doctrine in order to prevent old conflicts being constantly reopened in the name of justice. By sanctioning the new status quo, the law of nations at least gets closure at the end of wars (III.20.11, 809; see II.4.8, 225; III.10.5, 720). Just-war doctrine could lead in practice to results the opposite of those it presumably intends:

The institution of legal or "public" war is not the only abridgement of justice in war allowed by the law of nations on humanitarian grounds. Its rules for *ius in bello*, justice in the conduct of war, grant combatants power over prisoners of war that extends far beyond what is allowed by natural law. To begin with, all captives may be made slaves. Slavery itself is countenanced by natural law in the roundabout way we have seen, but only if it arises by consent or as a punishment for crime (III.7.1, 690). By the law of war, however, captives become slaves regardless of personal guilt

(*ibid.*).¹³ Moreover, there is no suffering or torture to which these slaves cannot be subjected, even unto death, though by natural law masters do not have the power of life and death over slaves (II.5.28, 257; III.7.6, 694). The humanitarian motive Grotius finds behind this permission is to save the lives of the captives. If victors were not given absolute mastery over the vanquished, they might simply slaughter them (III.7.5, 692). It is in order to prevent this greater evil that a privilege is conferred on conquerors which is condemned by natural law. And it bears repeating that this privilege, like all the privileges of war, is granted to unjust as well as just combatants.

There is undeniably something tragic about permissions like this in the law of war, and something terrible about the necessity that compels the society of nations to extend them. Yet, as Grotius presents it, the law of nations has no choice but to bow to this necessity and sanction injustice in the name of humanity itself. The tragedy stems from the fact that precisely those who seek peace and are devoted to the cause of humanity must grant permissions to cruelty and injustice. The harsh realities of international politics, especially war, sometimes make justice impossible or even counterproductive. In one of the most harrowing passages of the *Law of War and Peace*, dealing with the root necessity to extend the rights of war to just and unjust combatants alike, Grotius states frankly that "the laws have come to terms with crimes (III.4.5, 646)."¹⁴ Humanity and the common good alike require it. Grotius does nothing to disguise the ugliness of this fact. A casuist, using Grotius's own principles, might suggest that any injustices truly required by the common good could be brought under natural law via its grounding in rationality and sociability. Grotius does not attempt such an argument, and indeed it would be disingenuous to do so. The law of nations has simply granted impunity to crimes.

The permissions under discussion, however tragic, do at least have the redeeming justification of minimizing suffering. But there are others for which Grotius never offers any justification beyond the explicit or tacit agreement by which the community of nations has established them. For example, the law of war has decreed that states at war may kill anyone they find in enemy territory, whether soldiers or not, whether citizens of the enemy state or not (III.4.3, 644; III.4.6, 646). Grotius offers the explanation that harm may be feared from them (III.4.6, 646).¹⁵ There is presumably no such justification for the slaughter of women and children, also permitted by the law of war (III.4.9,

¹³ This appears to be one origin of absolute government in Grotius, sovereignty by conquest (just or unjust): III.8.1–2, 697–9.

¹⁴ Grotius is here quoting Cyprian. In the same place, he also quotes a phrase used by Lucan, "right given over to crime" (III.4.5, 646).

¹⁵ Grotius says that the law of nations also allows combatants to kill any subjects of the enemy nation, wherever they may be found—in their homes, at sea, or in foreign lands—on the grounds that war against a state is war against all its people (III.4.8, 647). He later suggests that the law of nature itself allows this (III.4.18, 654).

¹² I am leaving out of account the one partial exception generally acknowledged by the just-war theorists: If both parties sincerely believe they are in the right, they both fight blamelessly, though one of them must be mistaken (II.23.13, 565; Suárez [1612] 1944, II.18, 337–8; Vitoria [1539] 1991, 282, 312–3). Gentili ([1612], 31–3) who in other respects was very influential on Grotius, is one exception.

648).¹⁶ With cases like these, in which grave injustices are permitted without any discernible humanitarian benefit, we are confronted with the most questionable exercises of the human power to make laws, or rather to grant permissions from natural law. These force us to return to the question of the potency of human will relative to natural law.

HUMAN WILL AND NATURAL JUSTICE

The structure of the third and final book of the *Law of War and Peace* suggests deep ambivalence on Grotius's part about the status of human permissions in the law of war. The first chapter presents a brief synopsis of what the law of nature permits in war. Chapters 2–9, roughly 100 pages, then discuss what is permitted in war by the law of nations. It is in this section that all the permissions discussed above appear. Finally, the last sixteen chapters of Book Three, roughly 150 pages, constitute an extended and very detailed plea for states to follow the higher standards of the law of nature, or the morality of pure Christian duty. This is the concluding section of the *Law of War and Peace* as a whole, and the way Grotius introduces it seems to question the ability of human law to issue permissions of the sort he has just discussed. The tenth chapter opens with almost a statement of contrition:

I must retrace my steps, and must deprive those who wage war of nearly all the privileges which I seemed to grant, yet did not grant to them. For when I first set out to explain this part of the law of nations I bore witness that many things are said to be 'lawful' or 'permissible' for the reason that they are done with impunity, in part also because coactive tribunals lend to them their authority; things which, nevertheless, either deviate from the rule of right (whether this has its basis in law strictly so called, or in the admonitions of other virtues), or at any rate may be omitted on higher grounds and with greater praise among good men (III.10.1, 716).

Interpreters wonder, naturally enough, whether this means that Grotius denies to human law the power to grant permissions from natural law after all. The ensuing chapters are filled with statements of what nations should or should not do by the lights of morality, often explicitly contrasted with the permissions extended by the law of nations. Are these permissions legitimate or not? The matter is not a little muddled by Grotius's tendency in this extensive final section to appeal sometimes to natural law, sometimes to admonitions of virtues above and beyond natural law, and sometimes to the "law of love" found in the Gospel. This mixed procedure is visible already in the opening paragraph transcribed above. It makes sense perhaps as a rhetorical strategy to bring states around to a more moral behavior (See Onuma 1993b, 340; Tanaka 1993, 303), but it leaves Grotius's true attitude toward the power of human law unclear.

We might put the question this way: In Grotius's

view, are permissions granted by human law through a true moral power it possesses, or do these permissions merely represent the impunity that results from the nations deciding in concert to ignore justice? If the society of nations conspires to permit a certain injustice, no earthly power will be able to prevent it. Are such permissions only an expression of this power, or do they convey some measure of genuine right? Grotius is certainly capable of using the concept of impunity in the former sense. He notes, for example, that all things have been said to be permitted to kings, merely because kings are beyond the reach of human punishment (III.4.2, 643; cf. II.12.26, 360). Yet, this permission has no moral standing. Similarly, he says that when a manifestly unjust legal decision is rendered, it does not carry any moral obligation, though citizens cannot legally (*licite*) resist the decision. If another nation or its citizens are harmed by such a decision, they may prosecute their claim by force (III.2.5, 627; cf. *Prol.* 25, p. 18). Grotius also stated that there is this truth to the proposition that right is merely the advantage of the stronger, that law largely fails of its outward effect unless a sanction is attached to it (*Prol.* 19, p. 16). Are the permissions of the law of war, which effectively block enforcement of parts of the law of nature, simply a manifestation of this Machiavellian truth?

This does seem to be the attitude suggested by the opening paragraph of Book Three's tenth chapter, cited above. Again, though, we should note the rhetorical interest of Grotius in making the permissions outlined in the previous section look questionable—he wants to dissuade nations from taking advantage of them. More important, we should recall that Grotius has laid the groundwork for permissions granted by human law from the beginning of his treatise. In the first chapter of Book One he asserts that, although permissions are not strictly speaking an operation of law, they do *oblige* third parties not to enforce the law being remitted (*obligat*, I.1.9, 38). Yet, to speak of obligation in this way grants a kind of moral standing. The obligation stems from the consent that Grotius finds at the root of the law of nations, an act of human will whose potency we have already explored.

Nor should we forget that Grotius placed an absolute limit on the ability of human power to abrogate natural law. Human law cannot command what natural law forbids or forbid what that law commands (II.2.5, 192): It may permit injustice but not command it. Though the permission itself may be worthy of condemnation from a moral point of view, it is at least theoretically coherent to say that human law may grant such permissions as required by the grave imperfections of this world. Thus did Suárez countenance certain permissions to vice. The permissions of the law of war are much more devastating, violating some of the most basic restrictions of natural law, but the pressures under which it operates are correspondingly more severe. Some of the permissions it grants have humanitarian justifications, stemming from the perverse realities of war. And the rest may be justified as implicit determinations on the part of the community of nations that it cannot effectively bar the conduct in

¹⁶ Grotius finds that the law of nations is unsettled on the question of rape in war. It is "the law not of all nations, but of the better ones" that rape is impermissible (III.4.19, 657).

question, at least for the present. It is better to permit it than condemn the law to futility.
